literature and civilization from the earliest times. His lectures, published in 1860, as 'Manuscript Materials of Irish History,' are accounted the best single work on mediæval Irish literature. A second series of his lectures, 'The Manners and Customs of the Ancient Irish People,' made up of his later lectures, appeared in 1873. O'Curry prepared the catalogue of the Irish manuscripts in the British Museum, and with John O'Donovan (q.v.) worked on the compilation of the ancient laws and institutions of Ireland. Consult Hyde, Douglas, 'Literary History of Ireland' (London 1906); Webb, 'Compendium of Irish Biography' (Dublin 1878).

ODD FELLOWS, The Independent Order of, a secret, fraternal benefit society. The general administration of its laws is designated by the generic term Odd Fellowship. The origin of the society and the source of its peculiar name cannot now be historically traced. Until near the close of the 19th century it had been asserted for years that Defoe—the English novelist—mentioned "Odd Fellow" as early as 1745 A.D., but modern research has relegated this, as well as many other alleged incidents of the order's early days, to the realm of tradition. It is known, however, that a society grew up in England during the 18th century, almost rivaling in numbers and influence the Masonic Fraternity, and that this Antient and Most Noble Order of Bucks began to decline about the year 1773 and passed out of existence. A reasonable supposition attains among antiquaries that these lodges furnished the nucleus of the Odd Fellows, into one lodge of which George IV of England, while Prince of Wales, was quite unceremoniously admitted one night and became a member thereof at a date subsequent to 1780. This is the first authentic reference to the society of Odd Fellows by name. The earliest ritual extant is dated in 1797 and was used by the Patriotic Order. It appears from English contemporary history that an Improved Order existed prior to this, and the title, Most Noble Grand, for the presiding officer of the "Antient," as well as the subsequent Orders of Odd Fellows, would imply a common bond or succession. The Patriotic Order was followed by the Union, or United Orders and the Loyal Order. In 1813 various lodges of the Union Order met and organized the Manchester Unity of Odd Fellows, now the principal Friendly society in Great Britain. In 1819 the American Order was founded and was afterward affiliated with the Manchester Unity. This continued until 23 Sept. 1842, when the Odd Fellows of the United States resumed their original independence, reaffirming the resolution in 1843 and adopting a distinctively American ritual in 1845. In 1919 the Order celebrated the 100th anniversary of its American foundation with appropriate ceremonies and parades in all the chief centres of population in the United States.

Rise of the American Order.—The first lodge established on this continent was Shakspeare, No. 1, New York city, 26 Dec. 1806. The five Odd Fellows composing this lodge were of the Loyal Independent Order and the moving spirits were Solomon Chambers and his son John C., English mechanics from the south of London. The early members were zealous workers and other lodges were soon organized.

In 1809 the roll of membership, in the six New York City lodges, comprised 36 prominent citizens and business men, as well as many others of less influence. In 1819 George Pope Morris was admitted and at once became a leader in the councils of the Order in the Empire State. Attempts had then been made to plant Odd Fellowship in other parts of North America. In 1815 there were two lodges in Halifax, Nova Scotia. In Boston, during 1818, James B. Barnes—who had emigrated to the United States from England the previous year, and four others instituted Massachusetts Lodge, No. 1, and held regular meetings, the method being, like New York, ancient usage and self-institution. The records extant, however, date only from 20 March 1820. Washington Lodge, No. 1, of Baltimore, was organized 26 April 1819 under the leadership of Thomas Wildey, now recognized as the founder of American Odd Fellowship. Wildey came to the United States from England in 1818. He had been affiliated with one of the branches abroad since 1804—had "passed the chairs," and was known as a leading Odd Fellow. The "Unity" became fully organized 21 Jan. 1814. Wildey began his search for Odd Fellows as early as 13 Feb. 1819, when he advertised in the *Baltimore American*; and, again, 27 March 1819, before the required "five for a quorum" had been obtained. The minutes state that the manner of institution was "ancient usage." This ceremony consisted of Wildey's obligation of himself in the presence of the others, and, in turn, the obligation of his companions. Subsequent events would indicate that the Manchester Unity ceremonies of 1816 were used by Wildey and his four associates: John Welch, John Duncan, John Cheatham and Richard Rushworth. On 26 Dec. 1821 Pennsylvania Lodge, No. 1, Philadelphia, was formed, like those in New York, Boston and Baltimore, on the self-institution principle, John Pearce being the leader and his associates were, likewise, English mechanics. While the Order had been planted in four States and the chief cities thereof according to ancient usage, an effort was soon made to frame constitutions and to obtain charters from the so-called regular bodies of Odd Fellows in England. Meantime the pioneers exercised the functions of Grand Lodges—instituting other lodges and assuming sovereignty over them. The Order in Baltimore secured a charter, under date of 1 Feb. 1820, from the Duke of York Lodge, Preston; and this charter not only recognized the regularity of Washington, No. 1, and its associate lodges, but created the Grand Lodge of Maryland and of the United States of America, of the Independent Order of Odd Fellowship. In Brooklyn, Columbia Lodge, No. 1, obtained a charter from Loyal Beneficent Duke of Sussex Lodge of Independent Odd Fellows, Liverpool. This document was delayed in transmission and did not reach its destination until late in January 1823, although dated 4 Nov. 1822. Meantime Columbia Lodge had removed to New York. It at once assumed sovereign jurisdiction and this led to contention; and the attempt of Morris and others to establish a supreme government with headquarters in New York. At this juncture Pennsylvania applied to the Order in New York and Maryland for recognition. It is recorded that the evidence of regularity re-

ceived from New York City was more satisfactory to the Odd Fellows of Philadelphia than that of Baltimore; and it is also stated the lodges in Boston, New York and Baltimore were not aware of one another's existence before this event. The Order made history rapidly during the succeeding six months. Each locality was dominated by a master mind: Wildey, in Maryland; Morris, in New York; Barnes, in Massachusetts; Pearce, in Pennsylvania. The question of supremacy, however, was soon settled. Massachusetts readily surrendered its claims to priority and accepted a charter from the Grand Lodge of Maryland and the United States on 9 June 1823; and the Grand Lodge of that commonwealth was duly opened 11 June 1823, all the lodges participating. The Order in that State accepted a like charter dated 4 June 1823 and the Grand Lodge was duly instituted 24 June 1823. It having become known that Wildey had endeavored to unite the Odd Fellows of Massachusetts and New York, overtures were also made to Pennsylvania and these were immediately accepted. The charter is dated 13 June 1823 and the Grand Lodge of the Keystone State was organized 27 June 1823. The consolidated Order became at once homogeneous and prosperous. As a prelude to these momentous events, coincident with the *actual* foundation of the American Order, the managers in Maryland had organized, under the Duke of York Lodge charter, the Grand Lodge of Maryland and of the United States, 22 Feb. 1821, which relegated Washington and others, in Maryland, to the condition of subordinate lodges. Following the centralization of the government of the four pioneer commonwealths, the "Grand Lodge of the United States" was evolved, on 15 Jan. 1825, by the representatives of the Grand Lodges of Massachusetts, New York, Pennsylvania and Maryland, the last-named taking her place with the State Grand bodies, subordinate to the sovereign head. This theory of a government composed of one head, the source and repository of all true Odd Fellowship, with subordinate State bodies and lodges subordinate, in contradistinction to the English system of a governing movable committee, was due to the genius of John Pawson Entwistle, who had joined the Order in 1820, becoming the *brains* of the young organization; Entwistle, the first Deputy Grand Master, was afterward Grand Secretary, but his career as a "builder" was cut short by his early decease. The last link in the chain of regularity was forged 15 May 1826, when the American body was chartered by the Manchester Unity. Significant of this, the early charters were issued to the Order of Independent Odd Fellows and the branches originating in the United States were organized irrespective of the consent of the English body even prior to 1842-43, the date of official separation.

Government and Degrees.—Between 1826 and 1885 the government of the Order had been evolutionary in its nature. The inheritance from England in ritualistic matters was the merest outline of a possible utility. The degrees were crude in structure and unsuited to the genius of a modern fraternal society, being copies from orders of other origin—notably from Masonry. When the foundations of government had become settled, attention began to

be paid to degrees of higher significance than the lodge system. Entwistle gave the first impulse to this part of the fabric of Odd Fellowship. After his death the work was continued by a long line of distinguished Odd Fellows, including such American citizens as James L. Ridgely, Grand Secretary from 1838 to 1881; James B. Nicholson, Isaac McKendree Veitch, Schuyler Colfax, who may be said to have been the "builders" of the Order; Rev. Edwin H. Chapin, D.D., Rev. James D. McCabe, D.D., Tal. P. Shaffner, who, together with Entwistle and Ridgely, were largely the authors of the present American ritual. Two English degrees and one American, finally, made up the encampment series. As early as 1821-25 these were conferred in connection with the lodge department. The final separation of the encampments into a distinct branch, higher than the lodge and governed by Grand Encampments, did not occur until 1841. In 1851-52 the Rebekah degree was adopted, its author being Schuyler Colfax. This is a branch to which both sexes are admitted, but was made with a view to admitting women to the Order. The sequence of degrees was completed in 1885 by the adoption of the Patriarchs Militant and organization of the uniform or display branch. The Grand bodies followed the sequences of the degrees. In 1879 the name of the supreme body was changed to the Sovereign Grand Lodge, a title more in consonance with its inherent powers, especially in its jurisdiction without the United States of America. The Sovereign Grand Lodge is made up of Grand Representatives from the Grand Lodges and Grand Encampments of the United States and Canada. Grand Lodges possess jurisdiction over State and Provincial Rebekah Assemblies and Rebekah lodges, as well as in the government of subordinate lodges. The Patriarchs Militant, with the local unit, called Canton, is organized like the United States Army, with Department Councils, all under the immediate government of the Sovereign Grand Lodge. In Australasia, Denmark, Germany, the Netherlands, Sweden and Switzerland, Quasi-Independent Grand Lodges govern the Order. These hold an allegiance to the Sovereign Grand Lodge, use the American ritual modified, and a common bond exists in connection therewith; but they do not enjoy a representation in the sovereign head. They, however, govern the Order in the countries named and conform to the laws and usages of the civil governments thereof. The development of this dual system was the labor of many years and varied experiments. The dates of the introduction of American Odd Fellowship without the United States were these: Canada, 1843; Australasia, 1868; Denmark, 1878; Germany, 1870; the Netherlands, 1877; Sweden, 1884; Switzerland, 1871. As early as 1846 lodges were instituted in the Hawaiian Islands; in Cuba, in 1883; in Mexico, in 1882; and the Order has followed the flag into the Orient, having been established, including South America, in 22 nationalities, provinces and territories, in 18 of which Grand Lodges have been chartered. In 1914, however, of the entire lodge membership of 1,672,658, only 63,562 were enrolled outside of North America. In that year there were 1,508,791 Odd Fellows in the United States; Pennsylvania led with 157,751, followed by New

York with 126,294; Illinois with 105,062; Ohio, 87,788; Indiana, 84,044; Missouri, 63,657; Michigan, 62,200; Massachusetts, 60,436; etc., etc. Canada and Maritime Provinces had 100,305 lodge members and Australia 45,300.

Other Organizations of Odd Fellows.—

The largest body is the Manchester Unity, numbering 950,000 members. It has lodges throughout Great Britain and its colonies—a few in the United States—and is, in effect, a chartered benefit society. Annual reports are made to the government, under the laws regulating Friendly societies and actuaries determine the solvency or insolvency of the Order and license lodges accordingly. In ritual matters, likewise, it has nothing in common with American Odd Fellowship. The Grand United Order ranks next in relative importance. This body is the parent of the colored lodges in the United States and elsewhere and is of English origin. Other Friendly societies exist in Great Britain and are of more or less importance as health insurance associations.

Beneficent Features.—The American Order has not incorporated into its polity any features of health or life insurance; indeed, it has, on the contrary refused to recognize voluntary associations of Odd Fellows, the object of which was to enlarge the benefit systems of regular relief. Nevertheless, the Order has always insisted upon "stated weekly and funeral benefits," distinct from voluntary *charity*—these payments to members who are ill, or in affliction, being of "right," not a donation. This characteristic is a distinguishing trait of the American Odd Fellow. On the great seal is emblazoned: "We command you to visit the sick, relieve the distressed, bury the dead and educate the orphan." Correlatively the attention of the Order was early attracted to the founding of institutions of learning, several of which have survived. The dual motive of fraternity and stated relief led to the establishment of homes for the aged, the indigent, the widow and the orphan. Pennsylvania had six of these homes, New York has four, Illinois two, California two and several other States possess two, with more in prospect. Every Grand Lodge in the United States and Canada has one or more of these homes or has taken measures to found such an institution. This beneficence has been fostered in foreign jurisdictions as well; and the Order in Denmark has purchased the palace of the Crown Prince for this purpose, going into the "home idea" on a scale that eclipses all previous efforts. Other nationalities are in no wise behind their fellows in this beneficence.

The Reunion of 1865.—During the Civil War of 1861–65 the roll of the Southern jurisdictions was regularly called during the annual sessions of the Sovereign Grand Lodge. At the close of hostilities the officers and members in the South were welcomed to the chairs and seats which had been held for them during the four years of strife and separation. The roll-call at Baltimore, 18 Sept. 1865, by the venerable Grand Secretary Ridgely, was notable even in fraternal circles. Every survivor answered to his name and appointments had been made to fill vacancies so that the representation was complete. Attempts had been made throughout the States composing the Southern

Confederacy, with varying success, to keep up the organizations of the Order; but, at this reunion, measures were unanimously adopted whereby fraternal hands and hearts assisted in rebuilding the waste places. This was the first fraternization of the Blue and the Gray. The procession in the streets of Baltimore the next day, occupying more than one hour in passing any given point, attracted national attention. The marshals were Joseph Kidder of New Hampshire and John Q. A. Herring of Maryland.

ODE, a lyric poem supposed to express the feelings of the poet in the pressure of high excitement, and taking an irregular form from the emotional fervency which seeks spontaneous rhythm for its varied utterance. The Greeks called every lyrical poem adapted to singing—and hence opposed to the elegiac poem—an ode (*ôdē*, that is, song). The Dorians are said to have been the inventors of the choral ode to be sung by a group of persons; the Spartan, Alcman, is credited with having first divided the chorus into two parts, the strophe (turn), and antistrophe (counterturn). These two names had their origin in the fact that as the one group of the performers answered the other they turned to the right and then to the left. Later on from Sicily came a third addition, the epode, which was sung by the united chorus at the end of the movements to the right and left. The principal ancient writers who employed this form of verse were Pindar, Anacreon, Sappho, Alcaeus, among the Greeks, and Catullus and Horace among the Romans. As employed by English writers the ode takes either the Pindaric form of strophe, antistrophe, and epode irregularly arranged and contrasted; or, as in its later development, the form of a regular series of regular stanzas. The former style is found in Dryden's 'Ode for Saint Cecilia's Day,' while the latter is seen in Shelley's 'Ode to a Skylark.' The masters of English poesy who have carried the ode to its highest achievements are Milton, Marvell, Dryden, Collins, Gray, Coleridge, Wordsworth, Keats and Shelly. Consult Gosse, E. W., 'English Odes' (New York 1881); Scollard, Clinton, 'Odes and Elegies' (New York 1905); Sharp, William, 'Great Odes, English and American' (London 1890).

ODE TO DUTY. Wordsworth's 'Ode to Duty,' written in 1805 and published in 1807, is a noble appeal to the principle of morality for guidance and support. It represents in a measure a recantation of Wordsworth's earlier faith in the spontaneous and unguided impulses

of the heart, written at a time when he was coming to feel more and more the need of an invariable standard. While continuing to recognize the worth and beauty of the creed of joy and love, he feels that there must be also the mandate of the stern power which preserves the stars in their courses and lays the law of sacrifice and self-restraint upon the soul of man. Stern as is the voice of duty, it is yet also divinely beautiful,

"Nor know we anything so fair
As is the smile upon thy face."

The mood and temper of the 'Ode' is characteristic of much of Wordsworth's later work. According to Wordsworth's own statement the 'Ode to Duty' was modeled on Gray's 'Hymn to Adversity,' which in turn was imitated from Horace's 'Ode to Fortune.' The stanza is identical with that used by Gray, and there are resemblances in idea and phraseology. Consult notes in Dowden's 'Poems of Wordsworth' (Athenæum Press Series).

JAMES H. HANFORD.

ODE TO GOD, The (Russian title 'Bog').

In the 18th century the Deists of various European nations reveled in singing praises to God. We have such odes by Voltaire, Klopstock, Haller, Brockes, Young; in Russia the fashion was set by Lomonosov's 'The True God.' But none of these productions could equal Derzhavin's 'Bog,' which was at once translated into most of the European languages and, by Admiral Golovin, into Japanese. There are at least 15 French versions of the poem, while in English we have 'To God,' in W. D. Lewis' 'The Bakchesarian Fountain' (Philadelphia 1849); 'Ode to the Deity,' by J. K. Stallybrass (in *The Leisure Hour*, London 1870), 2 May; and 'Ode to God,' by Dole, N. H. (in *The Chautauquan*, Vol. X). Derzhavin commenced writing the ode in 1780, but finished it only in 1784, under the influence of a strong religious emotion. It begins with an appeal to God, then extols his infinite power and wisdom. Man is the reflex of the Divinity, hence man is not insignificant. He recognizes his relationship to God and, therefore, is assured of immortality beyond the grave.

LEO WIENER.

ODE ON A GRECIAN URN.

John Keats's 'Ode on a Grecian Urn' was first published in the memorable volume of 1820 which contains the greater part of its author's most characteristic work. Inspired by the loveliness of an exquisite form of Hellenic art Keats addresses his Urn as the very incarnation of beauty. Three pictures, characteristic of the representations actually found on the Greek vases, are described; the first a lively pursuit of maidens "in Tempe or the dales of Arcady"; the second a pastoral scene of love-making and music; the third a solemn sacrificial procession. To Keats the very incompleteness of the "flowery tale" told by this "sylvan historian" is an essential element in its beauty. What "men or Gods" these are we know not. The melodies the "soft pipes" play are heard in the imagination alone. The lover never consummates his kiss. But it is better so. Fulfilment and completeness would bring with them the sad satiety of all real experience. Frozen there in silence these scenes belong to the ideal world. The

vase becomes the type of that beauty which transcends all its sensuous embodiments:

"Thou, silent form, dost tease us out of thought
As doth eternity."

Its message is the self-sufficiency of beauty and the identity of the ideas of beauty and of truth. In form the poem is a regular or stanzaic ode, firmly knit in structure. Highly imaginative in expression and exquisite in rhythm, it has always been regarded as one of the most consummate of English lyrics. Consult the introductory essay in Selincourt's 'Poems of John Keats'; Brooke, 'Studies in Poetry'; Bridges, 'Keats, A Critical Essay'; Masson, 'Wordsworth, Shelley, Keats and Other Essays'; Arnold, 'Essay on Keats'; selected bibliography in Page's 'British Poets of the Nineteenth Century.'

JAMES H. HANFORD.

ODE: INTIMATIONS OF IMMORTALITY FROM RECOLLECTIONS OF EARLY CHILDHOOD.

The 'Ode on Immortality,' as it is generally called, by William Wordsworth, is by many considered the greatest lyric in the English language. It consists of 203 lines of irregular verse in 11 stanzas of unequal length, was composed between the years 1803 and 1806, while the poet was living at Town End, Grasmere, and was published in 1807. In effect it is a poem on the eternity and the destiny of the human spirit and the interrelation of man and nature. In its mysticism—its belief in intuitive knowledge, in the power of humanizing experiences to interpret nature and in the power of nature to sustain and console the spirit of man—it is a complement to Wordsworth's 'Tintern Abbey.' The two poems should be read together as the supreme statement of the Wordsworthian doctrine and philosophy of life.

Ostensibly the ode asserts the poet's belief in immortality as evidenced by his own transcendental experiences. As a child he seemed to retain vague recollections of a former state of being, and something of the radiance of this heavenly life still invested the outer world of sense. These are the "recollections of early childhood" which are to him "intimations of immortality." Even as a man he had his moments of transcendent vision when he saw into the life of things. He often spoke of such experiences to his friends and often in his shorter lyrics he alludes to them. On such esoteric and highly personal grounds he bases his belief in immortality. This is not a philosophy, nor did Wordsworth assert that it was such, yet it is quite sufficient to give body and consistency to the ode, which should be read not as an argument nor as a philosophy, but as the lyrical expression of a mystic's convictions, intuitions and dreams, transcending philosophies and facts. Though it is customary to speak of the "Platonism" of the ode, Wordsworth based his theory entirely upon his own experiences. In his preface he refers to Platonism, but rather as a sanction of his philosophy than as the source of it. With Plato, moreover, the recollection of past existence increases with a man's growth; with Wordsworth, it grows fainter. It is possible that Wordsworth may have taken hints from such 17th-century poems as Henry Vaughn's 'The Retreat,' 'Corruption' and 'Childhood,' and Thomas Traherne's

'Wonder'; but it is probable that the community of ideas between these poems and the ode is entirely accidental.

The structure of the ode, while coherent and carefully wrought, is not obvious unless the reader perceives it to be based upon the poet's train of thought and emotion. He stands in the midst of a May morning, but can no longer feel the joy of nature that he felt as a child—"there hath passed away a glory from the earth" (I and II); he tries to regain this early delight but fails, and asks whither it has fled (III and IV). The answer is that our birth is but a forgetting of our former existence; the child, fresh from heaven, invests all natural objects with the light that never was on sea or land; as he grows older the light fades (V and VI). As a child he is the "best philosopher": before life lays upon him the weight of custom, he reads the riddles of the universe (VIII). Yet the grown man does not entirely and forever lose the light and the memory; he has his moments of transcendent revelation when his spirit plays upon the shores of the universal ocean (IX); and, as a compensation for the loss of the early glory, has come a deeper insight into the meaning of nature, brought about by common human experiences (X and XI).

No such bare, cold and formal outline can afford any conception of the majesty and splendor of the great ode and the irresistible sweep of its power. Though based upon an intellectual concept, it is not argumentative or didactic, or even philosophic in the ordinary sense. Its thought is vitalized by its profound emotion, and both thought and emotion are enveloped with a glory of diction perhaps unequalled by any other English lyric. Though a few lines in the seventh stanza lapse into something approaching banality—Wordsworth's besetting danger—the style in the main is sustained at the very highest pitch of lyric excellence; and the poem abounds in lines unsurpassable for wealth of suggestive power, imaginative vision and sheer rhythmical beauty. Emerson called this ode the "high-water mark which the intellect has reached in this age." Critics from Coleridge to the present have considered it not only Wordsworth's supreme achievement, placing him among the Immortals, but, in its union of thought, emotion and music, probably the greatest of English lyric poems.

MARION TUCKER.

ODE TO A NIGHTINGALE. John Keats's 'Ode to a Nightingale,' published in the volume of 1820, is one of the richest and most impassioned of English lyrics. The essential theme of the poem is the intoxicating, almost stupefying, beauty of the bird's song, heard in darkness, and the experience it brings with it of momentary release from the weight of mortal care. Like the skylark in Shelley's poem the nightingale becomes a symbol of deathless happiness, and of "the life of sensation rather than of thought" for which Keats yearned. The poet loses himself in rapture and longs to die in the ecstasy of beauty, but the exalted mood quickly gives way to deep depression and the melancholy thought of self, as the song withdraws.

"Past the near meadows, over the still stream."

In no poem is Keats's marvelous power of rich poetic utterance more strongly felt. The lines are steeped in sensuous imagery, but the poet is carried by the intensity of his imagination far beyond mere sensation into the heart of wonder and romance.

"The voice I hear this passing night was heard
In ancient times by emperor and clown:
Perhaps the self-same song that found a path
Through the sad heart of Ruth, when, sick for home,
She stood in tears amid the alien corn;
The same that oft-times hath
Charm'd magic casements, opening on the foam
Of perilous seas, in faery lands forlorn."

The poem is a regular ode in eight stanzas. It falls short of the 'Ode on a Grecian Urn' in spirituality and perhaps in perfection of lyric form, but it is no less a favorite with lovers of essential poetry. Consult bibliography under article 'Ode on a Grecian Urn.'

JAMES H. HANFORD.

ODE TO THE WEST WIND. Shelley's 'Ode to the West Wind,' though not so popular as his 'Skylark,' is perhaps the technical masterpiece among his shorter poems. The poet himself says, "This poem was conceived and chiefly written in a wood that skirts the Arno near Florence, and on a day when that tempestuous wind, whose temperature is at once mild and animating, was collecting the vapors that pour down the autumnal rains. They began, as I foresaw, at sunset, with a violent tempest of hail and rain, attended by that magnificent thunder and lightning peculiar to the cisalpine regions." The poem was published with 'Prometheus Unbound' in 1820.

Above any other modern poet Shelley possesses that mythopoetic faculty of the Greeks which makes the forces of nature personal and alive. His West Wind is a tempestuous and elemental spirit, in which at the end he loses himself. The Ode consists of 70 lines of Italian terza-rima, a difficult metre, here used with astonishing skill. The metrical scheme differs from the Italian in that each of the five parts, or stanzas, of the Ode is metrically complete in itself and is rounded out with a couplet. The structure, planned and executed with a care unsurpassed in any other English lyric, embodies a definite pattern or design. The first, second and third stanzas, respectively, invoke the wind in its play with the dead leaves, the clouds and the waves. In these occur the aerial singing, the color, and the sweep that mark Shelley's characteristic treatment of natural phenomena. The fourth and fifth stanzas make the personal appeal, as the poet prays to be one with the wind; and the whole closes with an irresistible poignancy unmatched even in the poems of Shelley. The diction represents the poet at his best; the Ode abounds in exquisite phrasing, and every line is wrought with the delicacy of the highest poetic art.

In the skillfulness of its structure, in its splendor of imagery and felicity of phrase, in the intensity as well as the universal significance of the poet's aspiration, in its power to inspire the reader with the poet's own emotion and to sweep him along in a rushing tide of melody in which the music of nature and the human heart are identified and blended, the 'Ode to the West Wind' takes its place among the few perfect masterpieces of all modern lyric poetry.

MARION TUCKER.

ODELL, ô-děł', Benjamin Barker, Jr., American political leader: b. Newburgh, N. Y., 14 Jan. 1854. He was educated at Bethany College, W. Va., and at Columbia, leaving the latter after three years to enter the ice business with his father in Newburgh. He proved successful in business, acquired an interest in his father's establishment, and became president of the Consolidated Gas, Electric Light, Heat and Power Company of Newburgh and treasurer of the Central Hudson Steamboat Company. He early took an interest in politics and soon became a prominent local leader of the Republican party. In 1880 he was a candidate for State senator, but was defeated. In 1894 he was elected to Congress; re-elected in 1896, and declined the nomination in 1898. During his last term in Congress he was chairman of the committee on accounts and a member of the committee on the District of Columbia. Before his first election to Congress he had been chosen chairman of the executive committee of the Republican State Committee, and in 1898 was made chairman of the State committee. The election of Roosevelt as governor was, in large measure, due to the energy and skill with which he conducted the campaign. In 1900 he was elected governor of the State of New York. Under his leadership, laws were passed which increased indirect taxes and reduced the direct tax to .13 of a mill, and at the same time appropriations for roads and schools were increased. The administration of State insane asylums was also simplified by abolishing the board of managers and centralizing control under the commission on lunacy. In 1902 he was re-elected. In the first year of his second administration a referendum vote of the people authorized the enlargement of the Erie Canal which Odell had consistently urged. He opposed special legislation and vetoed a large number of special and personal bills; favored home rule for cities, and gave valuable aid to tenement house reform. In 1903 Columbia University conferred upon him the honorary degree of LL.D. in recognition of his public services. In 1905 he was defeated by Timothy L. Woodruff for the office of the State chairmanship, a position he had held previous to his election as governor for the first time.

ODELL, Jonathan, American clergyman and Tory satirist: b. Newark, 26 Sept. 1737; d. Fredericton, New Brunswick, 25 Nov. 1818. A grandson of Jonathan Dickinson (q.v.), he was educated at what is now Princeton University, studied medicine and was surgeon in the British army. After several years spent in England, where he was ordained a deacon of the Church of England, he became a priest in 1767 and was made rector of Saint Ann's, Burlington, N. J. He assured the colonial authorities that he would keep his loyalist sentiments to himself in the exciting times before the Revolution, but on 4 June 1776 he wrote his famous birthday ode for the king, which may have suggested, in part, the phraseology of 'Hail, Columbia,' as it begins 'O'er Britannia's happy land.' The New Jersey Convention, holding him an enemy to the American cause, exacted from him a parole to keep on the east side of the Delaware and within eight miles of Burlington. He was driven from home by the patriot forces and took refuge in the home of Margaret Morris,

who hid him in a secret chamber. He escaped to New York, where he took a prominent part with the Loyalists, notably by his acrid and satiric attacks on Congress and its individual members, as in 'The Word of Congress' (1779), 'The Congratulation,' 'The Feu de Joie' and 'The American Times' (1780). Upon the evacuation of New York he lived in England for a time and then removed to New Brunswick, where he, his son and his grandson after him held high office and took much interest in politics. He had a decided literary gift and was the most effective satirist on the Tory side. Consult the chapter on Odell in Tyler, 'Literary History of the American Revolution' and the collection of Odell's poems with those of Joseph Stansbury made by Winthrop Sargent in 1860.

ODENBURG, ô-dën-boorg (Hungarian *Sopron*), Hungary, a free city and the capital of a county of the same name, near the southwest shore of the Neusiedler See, 36 miles southeast of Vienna. It dates from the Roman *Scarabantia* and has several interesting ecclesiastical and other edifices. It is one of the finest cities of its size in Hungary. Among its excellent public buildings are several monasteries and churches, the Palace of Justice, the Gymnasium, the Realschule, the normal school, the Protestant Lyceum and other educational establishments. Its industries comprise woolen, linen and cotton cloth, sugar refining, cutlery, glass, agricultural implements, soap, starch, rubber goods, fire engines, bricks, vehicles of various kinds and earthenware; and it has a trade in these, and in corn, cattle, wool, wine and generally in agricultural products. Odenburg is one of the strongest Catholic centres in Hungary. Pop. mostly German, about 35,000.

ODENHEIMER, ô-dën-hî-mër, William Henry, American Protestant Episcopal bishop: b. Philadelphia, 11 Aug. 1817; d. Burlington, N. J., 14 Aug. 1879. He was graduated from the University of Pennsylvania in 1835 and after taking orders in the Episcopal Church in 1841 was rector of Saint Peter's Church, Philadelphia, till 1859. In the year last named he was consecrated third bishop of New Jersey. On the division of the diocese in 1874 he chose the diocese of Northern New Jersey (now Newark). He was prominent as a hymnologist, and among his published works are 'Origin and Compilation of the Prayer Book'; 'The Devout Churchman's Companion'; 'Private Prayer Book.'

ODENKIRCHEN, ô-dën-kêrk'ën, Prussia, city in the Rhine province, on the river Niers, 21 miles by rail southwest of Düsseldorf and at a junction of railway lines to Munich, Gladbach and Stolberg. It has Roman Catholic and Evangelical churches, a Jewish synagogue, a teacher's seminary and an agricultural school. There are textile, leather and dyeing industries. Pop. 20,060.

ODENSE, ô-dën-så, the third largest and one of the most important cities of Denmark. The capital of Odense Amt and the largest town on the island of Fünen, it is a busy seaport at the mouth of the Odense River near the fiord of the same name. It is one of the best built cities in Denmark. The streets are well paved and many of the houses are large

and handsome; and quite a number of them are modern. It is the foremost advocate of modern progress in the kingdom and was the first city in Denmark to have water distributed to public buildings and commercial and private houses. Among the notable public edifices of Odense are the cathedral of Saint Canute, built in the 13th century and the best example of Gothic architecture in the country, the church of Our Lady (12th century), Odense Castle (built by Frederick IV), a large and imposing City Hall, a very modern post office, the Agricultural College, the Technical School, a Seminary and the Archæological Museum. The harbor, which consists of two basins formed by the elongated basins of the Odense Ship Canal where it opens into the fiord is one of the most important shipping centres in the kingdom. This, added to the fact that Odense is the chief railway centre of the island of Fünen, gives it a very prominent place in the economy and trade of the nation. Among its chief commercial establishments are machine shops, breweries, textile mills, tobacco factories, distilleries, chemical works, glass factories and sugar refineries. From Odense are exported extensively, bacon, hides, butter and cheese. Pop. about 45,000.

ODENWALD, *ō'dēn-vālt*, Germany, a forest and chain of mountains and a mountainous region between the Neckar and the Main, in the territories of Hesse-Darmstadt, Baden and Bavaria. The Neckar divides the Odenwald from the Black Forest. The Odenwald is about 50 miles in length, contains 1,740 square miles and in Katzenbuckel attains a maximum altitude of 2,057 feet. Several other peaks reach in the neighborhood of 2,000 feet. It presents charming scenery and in literature is associated with much interesting tradition.

ODEON, *ō'dā-ōn*, among the Greeks and Romans, the name applied to a public building devoted to poetical and musical contests. The first odeon was built at Athens by Pericles and was afterward used for popular meetings and the holding of courts. At a later period two others were erected in Athens, beside those in other Greek cities. The first odeon at Rome was built in the time of the emperors. The odeons resembled the theatres, except that they were inferior in extent and were covered with a roof. The name is occasionally given in the United States to a music hall or theatre. Odeon is also the name of a theatre in Paris opposite the gardens of the Luxembourg Palace. It is devoted principally to the classical drama and is next in importance to the Théâtre Français. The Odeon was originally built in 1728. It has been destroyed by fire several times and during its existence has gone under various names.

ODER, *ō'dēr*, a river of Central Europe, which rises in Moravia, in the southern branch of the Sudetic Mountains, flows through Silesia, becomes navigable for small boats at Ratibor, passes by Breslau, where it is navigable for barges of 40 to 50 tons, enters Brandenburg and Pomerania and empties into the Baltic. Its whole course is above 562 miles. It receives numerous navigable streams, communicates with the Elbe by several canals and is of great commercial importance. The principal towns on its banks are Breslau, Frankfort and Stettin. Be-

fore reaching the sea it forms the large maritime lake called the Stettin Haff and divides into three branches—the Peene, Swine and Divenow. The Oder is generally shallow and though only in its upper courses does it flow through a hilly country, yet the current is generally swift and varies much in volume. Vast sums of money have been spent to confine it to its course with only partial success. Consult Brämer, 'Die Oder und ihr Gebiet' (Berlin 1899); Tietze, W., 'Die Oderschiffahrt' (Breslau 1906).

ODERBERG, Germany, town situated on the Alte Oder in the Prussian province of Brandenburg and about two miles from Bralitz and 47 miles from Frankfort-on-Oder. Oderberg has a splendid Gothic church, dedicated to Saint Nicholas. Another object of great interest to visitors is the Bärenkasten, an ancient castle now in a ruined state. Oderberg has extensive lumber interests and has a large trade with Russia in this commodity. Pop. 4,000.

ODES. Under the heading "Canti," or odes, are grouped 41 poems of Giacomo Leopardi of which five are fragments, and three in very brief form. The keynote is love of country. The best known of them is the first, 'All'Italia' ('To Italy') which appeared in 1818 together with the one upon the projected monument to Dante, 'Sopra il Monumento di Dante.' In the former, Leopardi recalls the glorious past of his native land as he looks upon the ancient ruins. He bemoans the sufferings of Italy, her weakness, her low estate, and the fact that the Italian youth must fight not for her, but for others. In the second ode is found the same despairing patriotism, but here the poet sounds a surer and more defiant note. In this he refers to the Italians who died in the service of Napoleon. 'Ad Angelo Mai' ('To Angelo Mai') appeared in 1820. The sub-title indicates that it was written upon the occasion of the discovery of the manuscripts of Cicero's 'De Republica' by Cardinal Angelo Mai, who was at this time the keeper of the Vatican Library. In this ode the poet wishes to put his countrymen to shame and to rouse them from their listlessness. He condemns them and the times in the strongest possible language, and evokes one after another the great masters of Italian culture, Dante, Petrarch, Columbus, Ariosto, Tasso and Alfieri. Of the other odes may be mentioned that on the wedding of his sister Paolina, in which he reviews examples of feminine courage, and the one entitled 'Bruto Minore' which is Leopardi's political testament.

AMERICO ULYSSES N. CAMERA.

ODESCALCHI-ERBA, *o-des'kal-ki'-er-ba*, the name of an ancient Roman house of princely lineage. The family takes its name from Enrico Erba, who was Imperial vicar of Milan in 1165. In 1709 Lucrezia Odescalchi, a sister of the Roman Pontiff, Innocent IX, was married to Alessandro Erba. She traced her descent from Giorgio Odescalchi, who lived at Como in the closing years of the 13th century. In 1714 Alessandro received the title of prince of the Holy Roman Empire and in the same year he was made His Serene Highness the Duke of Symium in Hungary. The family is to-day one of the most powerful in Italy. Its head is now styled Fürst Odescalchi, Duke of Symium in Hungary, prince of Bassano, and

a dozen lesser titles. Until the war he was also an hereditary magnate of Hungary. He is also a grandee of Spain and the holder of numerous foreign titles, orders and decorations. The Roman seat of the family is the Palazzo Odescalchi. Another seat is the beautiful castle of Bracciano. Several estates in Italy and Hungary also belong to this ancient house. Consult the 'Almanach de Gotha' and Reumont, A. von, 'Geschichte der Stadt Rom' (Berlin 1868).

ODES OF HORACE. Horace's Odes are in four books. Books I-III were published together in the year 23 B.C., when the poet was 41 years of age. Book IV appeared several years later, probably in 13 B.C. The four books embrace 103 poems. Horace's tastes had made him an earnest student of Greek literature, particularly of Greek poetry, and we thus find Greek models exercising the most potent influence over the form and content of his verse. So far as form is concerned, the Odes are founded mainly on the measures employed by the Lesbian poets Alcæus and Sappho (about 600 B.C.). In their contents and motives also, as well as in many bits of phrase and epithet, Horace is profoundly indebted to the same writers.

The Odes are brief lyric poems and cover a wide range of themes. Thus we have (1) Patriotic Odes. Horace's earnest patriotism and keen solicitude for the weal of the state, combined with his personal devotion to Augustus and his firm faith in Augustus's wisdom as a ruler, led him to devote his gifts to stimulating the national sense and quickening the national conscience. Some of the loftiest and most successful of his poems are the outcome of this purpose. Foremost in this class are the six odes at the beginning of Book III, in which the poet emphasizes the cardinal virtues that had made Rome great and to which he urges the rising generation to cling, if they would ensure the perpetuation of that greatness for the future. The horrors of civil war are touched upon in the fine ode to "the ship of state" (I, 14). In I, 37, a lofty note is sounded in the exultant ode of triumph at the defeat and death of Antony and Cleopatra. (2) Odes in Praise of Augustus. Book IV abounds in odes of this class, though they are not lacking in the earlier books. Among the most successful are the odes addressed to Augustus as the one hope of the state at the time when he was said to contemplate laying down his power. In IV, 5; IV, 15 and others Horace recounts the blessings of Augustus's sway, in which fertility, peace, honor, uprightness, chastity reign everywhere. (3) Poems on Life and Conduct. These form a large and characteristic class. Favorite motives are the uncertainty of life, the wisdom of a rational enjoyment of its pleasures, the cultivation of a spirit of tranquillity and contentment, the observance of "the golden mean," along with protests against the growing taste for luxurious living. The finest of all these is III, 29, on the superiority of the righteous man to the buffetings of fortune. (4) Love Poems. Love had been one of the most conspicuous themes in the Æolic lyric poetry of Sappho and Alcæus, on which the Odes are chiefly modeled. But Horace's passion lacks every token of sincerity.

His love poems represent no genuine experience or sentiment. Yet III, 9, is a successful little three-act drama in which estrangement passes to a happy reconciliation. (5) Praises of Wine. This favorite theme of the Æolic poets is only sparingly treated by Horace. In III, 21, we have an enumeration of the beneficent effects of wine. But in I, 18, we are cautioned that Bacchus's gift is not to be profaned, but should be enjoyed in moderation. (6) The other poems are miscellaneous in character. Some are affectionate tributes to friends; others are in honor of places, or elaborate some mythological theme. The concluding ode of Book III is a proud prophecy of the poet's immortal fame, "I shall not altogether die."

The 'Odes' have commanded the admiration, and have touched the hearts, of men of all nations through all the ages. As a master of lyric form Horace is unsurpassed. The happy phrases in which his works abound and for the coinage of which he possessed real genius have become current throughout the world. Many of his odes represent a very high order of poetry. His patriotism was genuine; his devotion to his sovereign was profound; his faith in the moral law was deep and clear. Wherever he touches on these themes, he speaks with conviction and sincerity and rises often to the loftiest level. But the very qualities of reason and reflection which made him successful here, naturally limited his success in treating of love and sentiment, the themes most frequently chosen for lyric purposes by other poets. On this account he has not infrequently been challenged as lacking title to high poetic rank. Fortunately the question of his eminence is not an academic one. Generation after generation continues to own the spell of the poet's verse. So long as this is true, we may fittingly ignore any theoretical discussions as to the merits of his lyric work. The most recent translation is by Charles E. Bennett in the Loeb Library.

CHARLES E. BENNETT,

Late Professor of Latin, Cornell University.

ODESSA, ô-dès'a, the most important town and seaport of southern Russia, in the government of Kherson, on the Black Sea, between the mouths of the Dniester and Dnieper, about 950 miles south of Petrograd. It is the fourth city of the country and is the intellectual and commercial capital of New Russia (Novorossiya). It is built principally of stone and is thoroughly modern in appearance. Among the promenades and squares of the city are the Nikolaï boulevard, beside the harbor, with a bronze statue of the Duc de Richelieu; the Cathedral square, with the monument of Prince Voronzoff; the Catharine square, with a monument of the Empress Catharine II; the Alexander Park, with a pillar in honor of the Emperor Alexander II. Among the Greek churches are the Cathedral or Sobornaja church, built in 1794-1848. The other buildings and institutions of the city comprise the town-hall, Voronzoff palace, archiepiscopal palace, public library, chief passenger railway station, university, town theatre, post office, custom-house, institution for noble ladies and barracks. The university, founded in 1864, as a development of the Richelieu gymnasium, has a large library, containing nearly 200,000 volumes, museums and an observatory. It has

faculties of medicine, law, philosophy, history and philology, mathematics and physics. There are numerous other educational institutions of different kinds and grades, including several technical schools. There are also hospitals, an orphanage, a founding institution and a bacteriological institute. Tramways and omnibuses facilitate internal communication; the town is well supplied with water from the Dniester and is electrically lighted. The harbor, which is protected on the southeast by a long mole with a lighthouse at the end, and by a breakwater, consists of several sections separated by shorter moles, and has a floating dock. The harbor, like the city itself, is quite modern and is deep enough to accommodate deep-draft vessels. The business of the port was, in 1912, over 1,450,000 tons from over 700 steamers. The port is usually icebound for a few days in winter, but an ice-breaker is now in use to keep it open. Strong batteries protect the harbor basins from seaward attacks. Odessa is the chief grain exporting seaport of Russia. Other articles of export are sugar, timber, flour, oil-seeds and oil-cake, beans, peas and fish. The principal imports are coal, tea, fruits, agricultural implements and machinery, iron and steel and raw cotton. The chief industrial establishments are the sugar refineries, flour-mills, oil-mills, engineering works, tanneries and tobacco factories, soap works, jute works, breweries. The city had, in 1912, nearly 500 large industrial establishments, employing over 22,000 skilled workmen and many unskilled laborers. Of the Russian ports only Reval and Petrograd receive more imports than Odessa. The imports of Odessa, for the most part, go to Petrograd, Kharkov and Batum. Odessa, named after Odessus, an ancient Greek settlement on this site, dates practically from the Turkish castle of Khadji-Bey, built in the 15th century and captured by the Russians in 1789. Odessa was bombarded during the Crimean War. Odessa is a very cosmopolitan city and is growing rapidly. In 1901 nearly one-third of the inhabitants of the city were Jews; and in its population of over 620,000 in 1911 were many Greeks, Italians and Albanians. Odessa was the scene of very serious anti-Semitic riots in 1905-06, in which many Jews and other foreigners lost their lives. At the same time the mutinous Black Sea fleet terrorized the city. The port was closed during the Balkan War (1912-13) and bombarded by the Turkish fleet at the beginning of the European War in 1914. See WAR, EUROPEAN.

ODEUM, a name sometimes used in the United States for a specific kind of theatre, generally known as "Odeon." See ODEON.

ODGERS, William Blake, English writer on law: b. Plymouth, Devonshire, 15 May 1849. He was educated at the University of London and Cambridge University, and became a barrister of the Inner Temple in 1873. He was recorder of Winchester 1897-1900, and of Plymouth 1900-12, after which he was recorder of Bristol. He became Director of Legal Studies at the Inns of Court (1905); and Professor of Law at Gresham College (1907). He has published 'King Arthur and the Arthurian Romances' (1872); and such well-known legal works as 'Odgers on Libel and Slander' (1881); 'Odgers on Pleading, Practice and Pro-

cedure' (1891); 'An Outline of the Law of Libel' (1897); 'Odgers on Local Government' (1899); 'Powell on Evidence' (1910); 'Odgers on the Common Law of England' (1911), and 'Bullen and Leake's Precedents of Pleadings' (1915).

ODIN, Teutonic god, called WODAN by the Saxons and Wuotan by the High German. He held a high place among the "ases" or secondary gods of the Scandinavian mythology at first, and later came to be held the centre of the system, the ruler of the world, the patron and source of all sciences, inventor of runic writing, of poetry, and of magic (hence identified with Mercury Hermes by the Roman writers on Germanic customs and religions), and, Minerva-like, a protector and companion of all brave heroes. Probably in origin he was a storm-god; his name seems to mean "the mad, or raging one" and as such he is portrayed as riding the eight-footed horse Sleipner. As a wind-god his functions were various: he presided over the harvest and over the sailing of ships, and was god of battles and of the dead. In battle he was accompanied by the Valkyries, who brought to Odin's banqueting hall, Valhalla, the slain heroes. Sometimes, Apollo-like, he is the sun-god, the sun is his eye, the heaven his canopy, and the mountain of Hlidskjalk his throne, at the sides of which are his raven messengers, Huginn ("Thought" or "Reflection") and Muninn ("Memory"), who bring him news of all that happens in the world; and the two wolves, Gere and Freke. He had a wonderful eight-footed steed named Sleipner, a magic spear called Gungner and a talismanic ring, Draupner. In drinking at the fountain of Mimir he lost an eye but became the wisest and greatest of the gods. Odin's wives were three: Iord (the inhabited earth), Frigg (the cultivated earth), and Ring (the winter-flocked earth). Snorre Sturleson and Saxo Grammaticus make Odin a chief, who in alliance with Mithridates fought the Romans unsuccessfully. To the Roman identification of Odin with Mercury is due the use of his name for the fourth day of the week (French "Mercredi," German "Dienstag," English "Wednesday," that is, Odin's or Wodan's day). Consult Anderson, R. B., 'Norse Mythology' (Chicago 1875). See ÆSIR; SCANDINAVIAN MYTHOLOGY.

ODO, or EUDES, *ēd*, of Bayeux, Norman bishop, English earl and viceroy, half-brother of William I, of England: b. about 1036; d. Palermo, Italy, Feb. 1097. He became bishop of Bayeux in 1049, and participated in the Norman Conquest in 1066, gathering the ships for the expedition and taking part in the action at Senlac. He was made Earl of Kent in 1067, was a royal minister and, in the absence of William I, was frequently called upon to serve as viceroy. In 1083 he was accused of planning a military expedition to Italy for the purpose of making himself pope and was summarily disgraced and cast into prison, where he remained until just before the death of William I. He led a rebellion against William's Rufus for the purpose of gaining the throne for his nephew, Duke Robert, but was unsuccessful. He was permitted to leave the country and joined Robert in Normandy where he enjoyed considerable influence. He died while on the way to Palestine in the First Crusade. He rebuilt

the Cathedral of Bayeux, and it is supposed that he ordered the Bayeux tapestry. Consult Freeman, E. A., 'History of the Norman Conquest' (1870-76); Round, J. H., 'Feudal England' (1895).

ODO, or **EUDES**, *éd*, of Paris, king of France: b. about 857; d. 1 Jan. 898. His father was Robert the Strong, the first of the Capet line. As Count of Paris, Odo successfully defended Paris from the Norse in 886. Two years later he was made king of the West Franks in succession to Charles the Fat, who had been deposed. Charles the Simple made several unsuccessful attempts to regain the throne, but Odo held on and at his death recommended Charles as his successor. Consult Favre, Edouard, 'Eudes, comte de Paris et roi de France' (Paris 1893), and Lavissee, Ernest, 'Histoire de France' (Vol. II, ib. 1903).

ODOACER, *ō-dō-ă'sēr*, or **ODOVACER**, king of Italy: b. about 435; d. 5 March 493. The son of Edecon or Edicon who may be identical with one of Attila's lieutenants, and a Scyrian or Rugian of noble birth, he became a leader of a band of Rugians, Herulians, Scyrians and Turlilingians. He entered the Roman army about 470, and in 476 was a member of the Imperial bodyguard. When Orestes deposed Nepos and made his own son, Romulus Augustulus I, emperor, Odoacer headed the rising of the dissatisfied German soldiers, killed Orestes, forced Romulus to retire, received the title of Patricius from the Eastern emperor Zeno, but no recognition as king of Italy; yet in spite of this he played the part of king ably for a time. This was formerly looked upon as the date of the fall of the Western Empire. He took up his official residence at Ravenna which he made his capital. He conquered Dalmatia in 482 and defeated the Rugians in 487 and 488, but in 489 Theodoric, king of the Ostrogoths (q.v.), was sent against him by Zeno, who had become alarmed at the conquest made by Odoacer. He hoped by this move to get rid of not only Odoacer but of the Goths who had been threatening Constantinople for some time. Odoacer, defeated at the battle of Isontius (Isonzo) in 489, retired; but making a second stand at Verona, was again defeated. Hastening to Rome he found the city in insurrection; so he went to Ravenna, where he reassembled his army, marched against the Goths in 490, defeated and pursued them to Pavia. But later he was defeated for the third time on the banks of the Adda. He retreated to Ravenna where he was besieged by Theodoric for three years and forced to surrender, Theodoric promising him a share in the rule of Italy. The defeated king was assassinated at a banquet a week after his surrender. Consult Gibbon, Edward, 'Decline and Fall of the Roman Empire' (Vol. IV, London 1912); Hodgkin, T., 'Italy and her Invaders' (Vol. III, 1885).

ODOMETER, a small clock-like mechanism employed for registering the number of revolutions of a carriage, automobile, bicycle, or other wheel, to which it is attached. The workings of the odometer are very simple: Two wheels of the same diameter, and turning freely on the same axis, are placed face to face; the edge of one is cut into 100 teeth, and that of the other into 99 teeth, and an endless screw works into the notches in each wheel.

When the screw has turned 100 times around, the wheel having 99 teeth will have gained one notch on the other, which gain is shown by an index attached to one wheel, which passes over a graduated arc on the other. Every 100 turns are thus registered on the second wheel, and all turns less than 100 are shown by a separate index. Now, instead of the screw turning on its axis, it is found more convenient to have the screw fast, and to allow the weight of the machine to be suspended freely, so that as the carriage wheel turns, the effect is the same as turning the screw on its axis. Other forms of the odometer are now in use on bicycles, and motor vehicles of all kinds. It is also called "cyclometer" and "speedometer," and is made to indicate the distance traversed and the rate of travel.

ODONATA, an order of insects comprising the dragon flies. See DRAGON FLY.

O'DONNELL, Frank Hugh, member of the Irish parliamentary party: b. 1848; d. Nov. 1916. In 1888 he brought a libel action against the London *Times* claiming £50,000 (\$250,000) damages in respect of certain statements in the famous "Parnellism and Crime" articles published in that paper. Though he lost the action, it was mainly as a result of the case that the Parnell Commission was set up two months later.

O'DONNELL, *ō-don'ēl*, Leopold, DUKE OF TETUAN, Spanish marshal: b. Santa Cruz, Teneriffe, Spain, 12 Jan. 1809; d. Bayonne, France, 5 Nov. 1867. He entered the Spanish army and supported Maria Christina, the queen-mother, in her struggles against the Carlists, and by intrigue he secured the appointment of governor-general of Cuba in 1843, where he made use of his office to enrich himself. On his return to Cuba in 1848 he carried on his political intrigues against the ministers successively in power; and in 1854 he finally headed a military insurrection; but he was soon defeated and driven into Andalusia. There he made a deal with Espartero; declared himself a liberal; and became War Minister under Espartero in 1856 and 1858 was Prime Minister. In 1859 he led a successful expedition against the Moors, and as a result, was made Duke of Tetuan. He was recalled in 1863 and again in 1865-66, but never held the confidence of the country. Consult Alfaro-Manuel Ibo, 'La Corona de laurel' (Madrid 1860).

O'DONOGHUE, *ō-dōn'ō-hū*, David J., British biographer and editor: b. London, England, 22 July 1866. He was educated in Roman Catholic schools and entered journalism in which field he has written principally on Irish art, music and literature for leading Dublin newspapers. He founded the Irish Literary Society in London and is vice-president of the National Literary Society in Dublin. In 1909 he became librarian of University College, Dublin. He has published 'Ireland in London' (with F. A. Fahy, 1887); 'The Poets of Ireland' (1891-93); 'Traits and Stories of the Irish Peasantry' (4 vols., 1896-97); 'Irish Humourists' (1892); 'Minor Irish Poets' (1893); 'Humor of Ireland' (1894); 'Introduction to Reliques of Barney Maglane' (1894); 'Irish Poetry of the 19th Century'

(1894); 'List of 1,300 Irish Artists' (1894); 'James Fintan Lalor' (1895); 'Life of William Carleton' (2 vols. 1898); 'Life and Writings of James Clarence Mangan' (1898); 'Works of Samuel Lover' (1899); 'Richard Pockrich' (1899); 'Life of Robert Emmet' (1902), etc.; 'Poems and Prose Writings of James Clarence Mangan' (1903-04); 'Sir Walter Scott's Tour in Ireland' (1905); 'Essays of Thomas Davis' (1915).

O'DONOJU, Juan, hoo-än ò-dõn-ò-hoo', Spanish soldier: b. Spain, about 1755; d. Mexico, 8 Oct. 1821. He entered the Spanish army where he attained the rank of lieutenant-general and in 1821 appointed captain-general and acting viceroy of New Spain. Upon his arrival at Vera Cruz he found the country in the hands of the revolutionists and his authority only nominal. He accordingly resolved to treat with the insurgents and on 23 Aug. 1821 he signed with Iturbide at Córdoba a treaty which recognized Mexico as an independent state over which a Bourbon prince was to reign. The country remained in the hands of the revolutionists and O'Donoju died before the nullification of his treaty by the Spanish Cortes.

O'DONOVAN, ò-dõn-ò-van, John, Irish scholar: b. Attateemore, County Kilkenny, Ireland, 9 July 1809; d. Dublin, 9 Dec. 1861. He was educated in Dublin, entered the Irish Record office in 1826 and was appointed in 1829 to the historical department of the Irish survey. He was connected with the Irish Archæological Society from its foundation in 1840. In 1847 he was called to the Irish bar, and from 1852 was in the employment of the commission for the publication of the ancient laws of Ireland. He wrote very extensively on Irish history and antiquities and he was the editor of the publications of the Irish Archæological Society, and later became professor of the Irish language in Queen's College, Belfast. Of the many editions of Irish works issued by him, the greatest is that of 'The Annals of the Four Masters' (1848-51). He also wrote an authoritative 'Grammar of the Irish Language' (1845). Consult Carrigan, 'History and Antiquities of the Diocese of Ossory' (Dublin 1905); Gilbert, 'Memoirs' (London 1862); Hyde, D., 'Literary History of Ireland' (London 1906).

O'DONOVAN, William Rudolf, American sculptor and painter: b. Preston County, Va., 28 March 1844; d. 20 April 1920. He served in the Confederate army during the Civil War and at its close opened a studio in New York. His work, though his art is self-taught, soon gained a reputation and in 1878 he became an associate of the National Academy. He executed the statue of Paulding at Tarrytown, the statues of Washington for Caracas, Venezuela, Newburgh, N. Y., and for the Trenton battle monument. The equestrian statues of Lincoln and Grant for the Soldiers and Sailors' arch in Prospect Park, Brooklyn, are his work, also the memorial tablet to Bayard Taylor at Cornell University, a statue of Archbishop Hughes at Fordham University and many other public memorials. It is, however, in portraiture that he has gained more distinction. Of his many portraits may be noted that of William Page, N.A. for the National Academy of Design;

of Winslow Homer, N.A.; Thomas Eakins, N.A.; Swain Lyford, N.A.; Arthur Quartley, N.A.; General Joe Wheeler for the National Gallery at Washington, Walt Whitman and E. A. Steadman. Since the beginning of this century Mr. O'Donovan devoted most of his time in painting directly from nature in tempera — the oldest of mediums used by the Egyptians, the Greeks and early Italians. During that time, however, he made busts of Gen James Grant Wilson, of the distinguished art expert, A. W. Drake, and of Dr. Talcott Williams, sometime head of the school of journalism at Columbia University.

ODONTOGLOSSUM, an extensive genus of orchids of the tribe Vandeeæ and the sub-tribe Oncidicæ, natives of Central America, much prized by cultivators for their magnificent flowers, which are remarkable both for their size and the beauty of their colors. A considerable number of species have been introduced into Europe, and grow well in a moderate temperature. *O. crispum* or *O. Alexandra* is a superb flower, and was named after Queen Alexandra when Princess of Wales. There are over 100 species of this tribe, native of the Andes, from Bolivia to Mexico. They are all extremely handsome and so are much prized by collectors. They produce a pseudo-bulb, and spare, stiff, fleshy leaves and the plants are all epiphytes. Flowers in ample panicle and white, yellow or reddish. See ORCHID.

ODONTOLCÆ, a subdivision of the primitive subclass toothed birds, *Neornithes*, which has been variously limited. It is now held to comprise those (*Hesperornis*, *Enaliornis* and *Baptornis*) that have their teeth set in a groove in the mandibles; while the other genera, as *Icthyornis*, form the subdivision *Odontotormæ*.

ODONTORNITHES. A name proposed by the late Professor Marsh in 1885 for the extinct birds with teeth, *aves dentatae*. Because of the possession of teeth he considered them a subclass equivalent in rank to that of all other known birds combined dividing them into three chief groups or orders, the Saururæ, *Odontolcæ* and *Odontotormæ*. The first of these groups is known only from two very complete specimens of *Archæopteryx* from the Upper Jurassic deposits of Solenhofen preserved in the British and Berlin museums. *Archæopteryx* was a bird about the size of a common crow unique among birds in the possession of a long, vertebrated tail, each joint of which bore a pair of long quill feathers, impressions of which were perfectly preserved in the rocks. The wings of all other flying birds have the bones of the forearm, wrist and the united three middle fingers adapted for the support of the long quill feathers. The fingers of *Archæopteryx*, however, were free and movable, each, like the fingers of reptiles, ending in a sharp claw. The sternum or breastbone was absent or very small, and the vertebræ were more like those of reptiles than those of other birds, with the exception of the *Odontotormæ*.

The *Odontolcæ*, like the *Odontotormæ*, are known almost exclusively from the Cretaceous chalk rocks of western Kansas. They were swimming birds, standing about three feet high, with only vestiges of wings, but with powerful, webbed swimming feet. Their bones, unlike those of most other birds, are solid, and their

vertebræ are of the ordinary bird kind. The sternum, like that of the ostriches, has no keel on its under side. Impressions of their feathers preserved in the rocks prove that they too were like those of the ostrich, or *Apteryx*, that is plumulaceous. They swam, not like a duck or goose upon the surface, but in the water, coming to the surface to breathe. The teeth of the upper jaws are confined to the back part, and were inserted in a common deep groove, not in separate sockets. *Hesperornis* is the best known genus.

The Odontotormæ, on the other hand, were small birds about the size of a dove, or better of a tern which they resembled in habits. The wings were large and strong, in structure quite like the wings of modern birds, and the large sternum had a deep keel for the attachment of the muscles of flight. The teeth were inserted in separate sockets. The vertebræ, however, unlike those of all other known birds except *Archæopteryx*, are concave at each end like those of a fish, whereas the ordinary bird vertebra has its articulation at the ends saddle-shaped, that is convex in one direction, concave in the other. About a half dozen kinds of Odontotormæ are known from Kansas, the most famous of which is the one first discovered by Marsh in 1872 which he called *Ichthyornis*, because of its fish-like vertebræ. Other forms from the Cretaceous of New Jersey and England may belong with them, but their teeth and vertebræ if so, are unknown. The teeth of all Odontornithes are conical and slightly recurved like those of a snake or lizard though less slender, but unlike them they were not co-ossified with the jaws.

The classification of the Odontornithes proposed by Marsh has not been generally approved by ornithologists. The Saururæ, because of the more primitive structure of the tail and wings, are given a subclass rank by themselves while the Odontolcæ and Odontotormæ are considered to be two of the four chief groups of the other subclass, the Ornithuræ, of which the Ratitæ and Carinatæ, or as they are more properly known, the Dromæognathæ and Euornithes, are the two others, the last including more than 10,000 known species, the three others, recent and extinct, less than 100.

SAMUEL W. WILLISTON,

Walker Museum, The University of Chicago.

ODONTOTORMÆ. See ODONTOLCÆ.

O'DOWD, Bernard Patrick, Australian poet: b. Beaufort, Victoria, 11 April 1866. He was graduated from Melbourne University in arts and law and entered journalism in the interest of the labor party. Since 1887 he has been assistant librarian of the library of the Supreme Court of Melbourne. Among his published works are 'Dawnward' (1903); 'A Southern Garland' (1904); 'The Silent Land and Other Verses' (1905); 'Dominions of the Boundary' (1907).

ODDWYER, Joseph, American physician: b. Summit County, Ohio, 1841; d. New York, 7 Jan. 1898. He was educated at McGill University, Montreal, and at the New York College of Physicians and Surgeons, taking his M.D. in 1866. He became resident physician at the City Hospital of New York on Blackwell's Island in 1866 and later established himself in

practice in New York. He was appointed to the staff of the New York Foundling Hospital in 1872 and labored there for nearly 35 years, becoming a foremost specialist in the diseases of children. He perfected a system of intubation of the larynx, laboring 12 years to bring the idea to a stage of practical utility, and conferring a great service in the treatment of diphtheria and stenotic diseases of the larynx. He was among the first to adopt the use of the anti-toxin serum in diphtheria and threw himself whole-heartedly into the struggle with the early difficulties encountered in its use. He contributed extensively to medical periodicals and was author of 'Analysis of Fifty-six cases of Croup Treated by Intubation of the Larynx' (1888); 'Intubation in Chronic Stenosis of the Larynx' (1888).

ODYSSEUS, ò-dis'ús. See ULYSSES.

ODYSSEY, The. There is still no more plausible conjecture than the opinion that Homer composed the 'Odyssey' in his old age. In the phrase of a late Greek epigram it is "the setting sun, but still the sun." (Consult Stawell, F. M., 'Homer and the Iliad,' London 1909, ch. 10; and the analyses of Andrew Lang in his 'Homer and the Epic,' London 1893, p. 223ff). It is unnecessary, then, to repeat what was said in the articles HOMER and ILIAD on the unity of the two Homeric epics and their relation to one another. The literature of the higher Homeric criticism has been convicted of so many blunders and so much false reasoning that the burden of presumption now weighs heavily against the promulgator of any negative, separating or disintegrating hypothesis. An eminent scholar (Blass) said that even the 'Iliad' is as well composed as Plato's 'Republic.' A number of the greatest literary critics of the 19th century concur in the opinion that the 'Odyssey' is either the best or one of the best plots in existence and that it is certainly the world's most readable long poem. An abreviator of the familiar story, then, need not delay to reply to every foolish cavil that has been suggested by over-ingenious scholarship. It is enough to tell the tale in such a way as to bring out some of the excellencies of the plot and suggest some of the imaginative and poetic qualities that have held the attention of so many generations of readers.

Another order of inquiry, though hardly less conjectural than the divagations of the higher criticism, has more justification and more interest. What materials, what traditional motives of mythology, folklore and folktales, and early maritime adventure in the Mediterranean did Homer use and incorporate in the finished structure? Was Odysseus in some remote and mythological sense a solar divinity and have we a survival of this conception in the 350 cattle of the sun devoured by his men? What analogies may comparative literature or comparative folklore discover between the return of Odysseus or the journey of Telemachus and other legends of the "Return of the Husband or the Hero," and "The Quest of the Son for the Father," (Lang, p. 227). In what proportion do the adventures of Odysseus in western seas combine poetic invention, folklore, the sailor's gossip in the ports of Asia Minor and Western Greece, authentic traditions of early Greek commercial enterprise or the "sail-

ing directions of Phœnician mariners"? Can we localize on the map Scylla and Charybdis and that Ægean isle of Circe, and the Lotus Eaters and the land of the Phæacians? Is the big round eye of the Cyclops a symbol of the craters of the extinct volcanoes of the Solfatara region? Is Southern Provence as a reader of Anatole France suggests the true Phæacia, or is it Scheria or Ischia or Trepani in Sicily the home of Nausicaa, "authoress of the *Odyssey*?" Is Calypso's isle at the heel of Italy or at the foot of Monkey Mountain outside the straits of Gibraltar? Is Ithaca itself the little island that has traditionally borne the name or is it as Dörpfeld and an immense literature of his controversial adherents maintain Leukas? (Consult the exhaustive chapter on "Homeric Cosmography and Geography," in 'Seymour's Life in the Homeric Age,' New York 1907). What proportion of conscious allegory blends with the romance and the wonder and the folktales of the 'Odyssey'? (Consult Stawell, p. 149). Those who like to let the winged fancies loose in the haze of conjectural conceivabilities will enjoy the monstrous literature that has gathered about these questions. (Consult for example Harrison, J. E., 'Myths of the Odyssey'; and Thompson, J. A. K., 'Studies in the Odyssey,' Oxford 1914). It would be idle to discuss them in the space of this article.

In the sober history of Greek literature the 'Odyssey' like the 'Iliad' is merely the supreme example of a recognized type. The 'Iliad' was the best epic on an episode of the Trojan War, the 'Odyssey' the best story of the return of the heroes from Troy, their adventures by land and sea and the state of affairs they found at home after their long absence. The bards of the 'Odyssey' are represented as singing lays of both types. In the 'Odyssey' the central theme and the subordinate motives of folktale and mythology not only combine into an artistic plot, but yield larger dramatic and spiritual unities. It is not necessary to pronounce which of the three or four chief moral suggestions absolutely dominates the whole. The 'Odyssey' has been plausibly described as the poem of homesickness. The 58th line of the first book and the 28th line of the ninth book with Ovid's imitation almost anticipate "Home, Sweet Home." And a famous sentence of Cicero repeated by Bacon celebrates the loyalty of Odysseus who "preferred his old woman to immortality." Other critics have described the 'Odyssey' as the poem of wisdom corresponding to the 'Iliad,' the poem of bravery. For Horace its main lesson is the character of the sagacious, faithful, much-enduring Odysseus, equal to every emergency and patient of every stroke of fortune. Horace had not read Professor Wilamowitz' pronouncement that to speak of the character of Odysseus at all is sheer nonsense. (On Odysseus consult Jebb, 'Classical Greek Poetry,' New York 1893, pp. 48-53). In the present time readers who go as far as line 351 in book 24 where

"Justice through the world's first mouth of song
Proclaims the gods still live for these have paid."

will take it, as the Greeks did, as the poem of righteous judgment long deferred but at last fulfilled. The plot, though better composed, resembles that of the 'Iliad' in that it plunges in *medias res* and postpones the dramatic climax

by digressions and artful delay. (Consult Stawell, pp. 119-121ff.). What distinguishes the 'Odyssey' is the skilful interweaving throughout the first 12 books of the adventures of Odysseus and the situation in his Ithacan home with the voyage of his now grown-up son, Telemachus, in quest of his father. The poem opens with a council of the gods: Athene, the protectress of Odysseus, complains to Zeus that the hero because of the anger of Poseidon whose son the Cyclops, Polyphemus, he has blinded is still after 10 years of wandering from Troy detained by the nymph Calypso in a far off isle, while the suitors in Ithaca woo his wife and devour his substance. Zeus gives Athene a free hand. She descends to Ithaca disguised as Mentes and presents herself as a guest to Telemachus who sits glowering at the riotous suitors in his father's halls. She counsels him to call an assembly of the people and formally forbid his home to the suitors, and himself to go on a voyage to enquire about his father. Other episodes in this book portray the entire situation, introduce us to the leaders of the suitors, to the bard Phemius who sings episodes from the tale of Troy to them, to the tearful but slightly coquettish Penelope who presents herself in the men's hall and is rebuked by her son who now feels himself a man, to the old nurse Eurycleia. Odysseus, though absent, is throughout present to imagination as the centre of interest and the destined hero of the poem. (Stawell, p. 132). The story of Telemachus continues through the next three books. He summons an assembly, denounces the suitors, procures a ship with the aid of Athene disguised as Mentor, provisions it with the assistance of Eurycleia and without the knowledge of his mother. Accompanied by Mentor he visits old Nestor at Pylos, and learns much of the Trojan War and the return of the heroes. He then visits the splendid palace of Menelaus at Lacedæmon, hears of Menelaus' adventures in Egypt, sees the fatal beauty of Helen of Troy face to face and is recognized by her womanly instinct. When they weep at old memories their tears are stayed by the mingling in the wine of a portion of

"that Nepenthe which the wife of Thone
In Egypt gave to Jove-born Helena."

Then, as he is preparing to depart laden with gifts, the scene suddenly changes to the palace of Odysseus, where we learn of the distress of Penelope at her son's absence and the beautiful dream which Athene sends to console her, of the angry suspicions of the suitors and the ship which they station in ambush to intercept Telemachus on his return—thus preparing us to acquiesce in the awful retribution that overtakes them in the end. In this interesting suspense we are left until the resumption of the story of Telemachus in the fifteenth book. The fifth book takes up the story of Odysseus with a repeated council of the gods. Athene again complains of his hard fate and Hermes is dispatched to Calypso's isle to bid the nymph release him. She yields unwillingly, assists him to build a raft, which is minutely described and on which he embarks only to be wrecked by the wrath of Poseidon. Rescued by the wimple of the sea-goddess Leucothea he is finally cast ashore at a river's mouth on the coast of the Phæacians where he sleeps naked under a bed of leaves as a spark of fire is hidden in the

ashes. "The sea had soaked his heart out." (Chapman).

In the sixth book next morning by a dramatic coincidence the princess Nausicaa, daughter of Alcinoos, king of the Phæacians at the instigation of Athene drives with her mule car and attendant maidens to do her laundering at the river's mouth. The girls play ball and their cries when the ball falls into the river awaken Odysseus whose aspect terrifies all but the demure and dignified princess. She bids them clothe him and invites him to accompany her to the hospitality of her father's palace or rather as she naively explains her mother's, since queen Arete really rules the house. But to forefend gossip she bids him linger behind and enter after her. The city of the Phæacians, Odysseus' approach to the palace, and the gardens of Alcinoos are minutely described. When Alcinoos rebukes his daughter for her inhospitality in bidding the, stranger lag behind, Odysseus "lies like a gentleman" and avers that it was by his suggestion.

"If there be trouble to herward and a lie of the blackest can clear,
Lie while thy lips can move and a man is alive to hear."
—(Kipling).

The eighth book in a series of vivid scenes describes the entertainment of Oysseus by the Phæacians with song and dance and sports. The day closes with a banquet, and Odysseus about to enter the banquet hall meets Nausicaa and bids her goodbye in a scene of exquisite delicacy and reserve lightly touched with the faint sweet, unreal attraction of the maiden toward the interesting middleaged stranger. At the banquet the bard's songs of the Trojan War move Odysseus to tears. The king tactfully stops the singing and asks the stranger's name and story. Perhaps he had lost a friend or a brother at Troy. Thus we are introduced to the motive of a story within the story adopted by Virgil in Æneas's narrative to Dido and copied in all later classical epics. In artful dramatic climax the long withheld name is at last pronounced. "I am Odysseus, son of Laertes" (Stawell, p. 143), and for three books the auditors hearken enthralled to the tale of his 10 years' wanderings after the fall of Troy as he unfolds what Horace called his *speciosa miracula*. We are in fairy land where anything may happen, where magic casements open upon the foam of perilous seas whose entrance is guarded by clashing rocks, where Scylla and Charybdis lurk for the unwary mariner, where the song of the Sirens lures him to coasts strewn with the bleaching bones of old time heroes, where the witch Circe amid her fawning leopards and tigers brews her potent draughts and burns the odorless cedar by midnight as the shuttle flies through her magic loom, where Calypso the veiler proffers immortal youth to Odysseus if he will forget the discreet Penelope awaiting his return to rocky Ithaca, where dwell these kindly Phæacians whose self-steering ships will bring the weary mariner to his haven at the last.

Amid all these marvels stands out the journey to the Cimmerians' land where at the entrance to the pit of hell Odysseus consults the ghost of the seer Teiresias and sees the shades of those who have "gone west." For comparative literature it is the motive of Æneas' descent to the shades and of so many earlier myths and later epics. For comparative religion it is an

inextricable jumble of "survivals" and anticipations. For the lover of poetry it contains the ineffable pathos and tenderness of Odysseus' meeting with his mother's spirit and a hint of the mediæval motive, the ballad of dead ladies:

"They that in days long past were fair-tressed maids of Achaia." (2, 119; consult Lang, p. 312).

We share the breathless interest of the audience

"Hushed by the spell of his words as they sit in the shadowy dim hall" (Consult Stawell, p. 163).

and repeat with King Alcinoos (11, 276ff.,) "These nights are everlasting and I could listen to thy tale even to the coming of the dawn."

The next morning dawns with the bustle of preparation for Odysseus' return. The magic ships of the Phæacians bear him in oblivion of all he had suffered in

"Rest undisquieted, likest to death, unawakening sweet sleep."

to his island home where the swifter, closer-knit dramatic action of the last 12 books begins. Athene in the guise of a shepherd appears to him, reassures him in his first confused doubts, transforms him into the likeness of a beggar and directs him to the hut of his faithful swineherd Eumæus while she speeds to Sparta to hasten the homecoming of Telemachus. The fourteenth book describes with touches of humorous realism the conversation of Odysseus and the swineherd. The fifteenth brings Telemachus safely home, evading the ambush of the suitors. The sixteenth opens with Telemachus' visit to the swineherd's hut and the dramatic "recognition" of son and father who plot vengeance on the suitors. The latter baffled in their designs form new schemes. The seventeenth and eighteenth books recount Telemachus' return to the palace, Odysseus later arrival there in the disguise of a beggar, the pathetic recognition of him by his old dog Argos who dies on seeing his master after 20 years, and various scenes which bring out the insolence of the suitors and justify the appalling vengeance of Odysseus. The nineteenth book contains the first direct conversation between Odysseus and Penelope and his recognition by the old nurse Eurycleia who in washing his feet perceives the scar of a wound he had received when hunting in his youth. In the twentieth book Odysseus tosses throughout a sleepless night and broods on his wrath and gladly hears at early dawn the omen of an old woman's curse on the suitors for whom she must grind corn. During the banquet of this day the suitors warned of their impending doom by a seer "stare with great eyes and laugh with alien lips," in Tennyson's imitation of the Homeric phrase.

The crisis is brought about by Penelope's challenge to the suitors to shoot with the bow of Odysseus which she brings forth. All fail and the supposed beggar is allowed to try despite the angry protests of the suitors. Meanwhile by a prearranged plot Eurycleia, Eumæus and the faithful goatherd Philoetius who had been taken into their counsels shut up the women and close the doors of the great hall. Odysseus draws the bow and sends the arrow home through the apertures in the axe-heads to the consternation of the suitors, while a thunder clap from Zeus gives augury of his success in the greater contest that impends. Then at the opening of the twenty-second book comes what

the ancients felt as the supreme climax of the poem.

- "Stripped from the rags of the beggar he stood forth,
lordly Odysseus,
"Sprang to the great stone threshold upholding the
bow and the quiver,
"Showered the shafts at his feet and spake to the
wondering suitors:
"Lo one test is accomplished, too hard ye deemed for
fulfilment;
"Now at a strange new target I'll aim my arrows to
know if
"Mine be the fortune to hit it and glory by grace of
Apollo."

Then begins a murder grim and great to which only the accumulation of outrage from the beginning of the poem can reconcile the reader. Homer feels this and represents Odysseus as checking Eurycleia's exultant cries and chiding her with the words

- "Piety suffereth not that we make vain boast over
slain men;
"Pate slew these and the judgment of God, and their
deeds that were evil."

Like the 'Iliad,' the 'Odyssey' continues after what the modern reader feels to be the culmination. But we could ill spare the twenty-third book in which the hard-hearted Penelope as her reproachful son calls her at last recognizes Odysseus, and which contains one of the sweetest, truest most intimate portrayals in all literature of that friendship of happy marriage of which Homer elsewhere says "they themselves know it best." The last book, which many critics reject as a later addition, recounts the descent of the suitors' souls to Hades, the visit of Odysseus to his old father Laertes at an outlying farm, the beginnings of a conflict with the kinsmen of the suitors and the final arrangement of a peace by the intervention of Athene in the form of Mentor.

PAUL SHOREY.

ÆCOLAMPADIUS, ĕk"ō-lām-pā'dī-ūs (‘Light-of-the-House’), Græcized name of Johannes Hüssgen, German religious reformer: b. Weinsberg, Württemberg, 1482; d. Basel, 24 Nov. 1531. He began by studying law in Bologna, and after a further course in philosophy, history and the classical tongues in Heidelberg, Tübingen and Stuttgart, he returned to Weinsberg. He was appointed preacher at Basel in 1515 and assisted Erasmus in producing his edition of the New Testament. After two years' residence at Augsburg (1518-20) he entered the monastery of Saint Bridget at Altenmünster, near Augsburg. Coming upon Luther's writings he left the monastery and, joining the reform movement, eventually went to Basel (1522), where he was appointed professor of theology and occasional preacher in Saint Martin's Church. He vigorously pushed forward the Reformation by his disputations, addresses and writings; especially by his controversial activity at Baden in 1526 and at Bern in 1528; he did the same service at Basel, where as rector of the cathedral he occupied the leading ecclesiastical position. He was in 1531 called to Ulm and worked there with Bucer and Blarer in the cause of ecclesiastical reformation. He entered upon a stubborn controversy with Luther on the subject of the Lord's Supper and espoused the view of Zwingli in his 'De Genuina Verborum Domini, Hoc est Corpus Meum, Interpretatione.' In 1529 he held a public disputation with Luther on the same subject at Marburg. He was one of the kindest-

hearted and most liberal-minded of the reformers. Weak in health from his early days, he overtasked his strength, and by his premature death was in some degree a martyr to his own zealous activity. He was buried in the cloister of the cathedral at Basel. Consult Herzog, J. J., 'Leben von Johannes Hüssgen' (1843); Hagenbach, K. R., 'Leben von Johannes Hüssgen, mit ausgewählten Schriften' (1859); Walker, Williston, 'The Reformation' (New York 1900); 'Cambridge Modern History' (Vol. 2, New York 1904).

ŒCUMENICAL, ĕk-ū-mĕn'ī-kal (Greek, *oikoumenikos*, of, or pertaining to, the whole inhabited or civilized world, generally the Mediterranean Basin, universal). This epithet is generally applied to the general councils of the Church, or councils to which all the bishops throughout the world were invited. According to the theologians of the English Church there have been only six Œcumenical councils, namely, that of Nicæa, 325 A.D.; Constantinople, 381 A.D.; Ephesus, 431 A.D.; Chalcedon, 451 A.D.; Second of Constantinople, 553 A.D.; and Third of Constantinople, 680 A.D. In the Roman Catholic Church it is applied to those councils whose members are convoked from the whole world under the presidency of the Pope or his legates, and whose decrees, confirmed by the Pope, bind all Christians. In the case of the first Œcumenical council, that of Nicæa or Nice, the Emperor Constantine summoned the bishops and Hosius presided as Pope Sylvester's legate. Toward the end of the 6th century the patriarchs of Constantinople assumed the title 'Œcumenical' in the same sense as the epithet Catholic in the Western Church but the Roman See always refused to sanction it. See COUNCIL; NICÆA, COUNCIL OF.

ŒDEMA. See DROPSY; PATHOLOGY.

OEDENBURG, ē'dĕn-boorg, a royal free city and capital of the district of the same name in Hungary. See ÖDENBURG.

ŒDIPUS, ēd'ī-pūs, the principal character in three tragedies of the Greek dramatist Sophocles. He was the son of Laius, king of Thebes, and his wife, Jocasta. As Laius had been warned before the child's birth that he was to die by the hands of his son, he ordered the infant to be exposed on Mount Cithæron, his feet having first been attached together by a transfixing pin. The effect of this cruelty was that he was afterward known as "the man with swollen feet" (Œdipus). The herdsman to whom the task of exposing the child was committed compassionately gave him to the shepherd of Polybus, king of Corinth, who was childless, and Œdipus became that monarch's adopted son. The young man, who considered himself a prince of the Corinthian royal house, was once taunted with his origin by a drunken companion; his suspicions were roused and he fled from Corinth. The oracle at Delphi in answer to his inquiries as to his birth would only tell him that he was fated to slay his father and marry his mother. Leaving the oracle he pursued his journey and met Laius and his servants. The king of Thebes in his chariot tried to force Œdipus from the road and was slain by the young man, who slew all the attendants also, as he supposed. In course of time he reached Thebes, where

Creon, brother of Laius, had succeeded to the throne, and was offering the hand of the widowed Jocasta as well as the kingdom to the man who should release the city from the sphinx, a monster which devoured every one failing to find an answer to her as yet insoluble riddle. Œdipus answered the riddle and slew the sphinx. He had many years of prosperity as king of Thebes and husband of Jocasta, but eventually a pestilence visited the land which, according to the Delphic oracle, could only be checked by expelling from the country the assassin of Laius. When at last it was brought home to Œdipus that he was the man he put out his eyes and Jocasta hanged herself. Then Œdipus went forth a wanderer led by the hand of his daughter Antigone, the Cordelia of the Greek stage, until he reached Athens, entered the grove of the Eumenides and there was called without death or pain into the other world. The legend of Œdipus is, however, much older than the drama of Sophocles. It seems to have been one of the primitive folktales; and it eventually, in the hands of the storytellers, became one of the earlier epics of the Greek people. It is briefly but clearly indicated in the *Odyssey*. It seems, as a folktale, to have varied very much according to the district and the storyteller. Consult Jebb, Sir R. C., 'Œdipus Tyrannus,' 'Œdipus Coloneus' and 'Antigone' (Introductions, Cambridge 1891-1900); Seneca, 'Œdipus' and 'Phœnissæ.'

ŒDIPUS COLONEUS, *kō-lō-nē'ūs*, ('Œdipus at Colonus,' Greek tragedy by Sophocles, first presented at Athens after his death by his grandson, Sophocles, in the archonship of Nicon, 402 B.C. (See ŒDIPUS). The play, replete with pathos and beauty, is staged in the Eumenidian grove, to which the faithful Antigone has led her father, the blind Œdipus, and where he dies. Legend says that Sophocles by reading aloud the finest passages in it proved his sanity when brought before judges by his children who were eager to administer his property.

ŒDIPUS COMPLEX, a concept used in psychoanalytic procedures meaning that every individual has deeply buried within his unconscious certain tendencies which were once conscious in the human race but have by cultural repression become unconscious and unthinkable. It derives its name from the Greek theme of the story of Œdipus, written by many dramatists in the Grecian period, chiefly Euripides and Sophocles, and, expressed very tersely, portrays the tragedy and catastrophe which result from incest with the mother — or father. Traces of this old racial taboo and the efforts made by the individual in controlling it are made the special concern of the psychoanalytic technic, since the hypothesis assumed is, that the individual's unconscious motives are best appraised, as to their social ethical values, in terms of the individual's greater or lesser conquest of this old racial struggle. The Christian terminology, "unless ye leave father and mother, ye shall not enter the kingdom of heaven," is a non-psychological rendering of the same problem. The Œdipus Complex has to do only with unconscious thinking. To state it, as some silly critics of psychoanalysis have

done, as the "son's love for the mother" as a conscious process is nonsense. The hypothesis is one of the broadest generalizations of the psychoanalytic technic and its discovery by Freud, in its various disguised and complicated distortions, one of the great psychological generalizations of modern science. Consult Jelliffe, 'Technic of Psychoanalysis'; Jones, 'Papers on Psychoanalysis'; Lay, 'Man's Unconscious Conflict.' See PSYCHOANALYSIS.

ŒDIPUS REX is the masterpiece of Greek drama. Sophoclean art is here at its highest. In subtlety of structure the play remains to this day unequalled. Among all the choral compositions of Sophocles the odes are distinguished for their variety. To sentiments most diverse the poet gives admirable lyric expression. The 'Œdipus Rex' is a magnificent psychological study of a great character suddenly meeting with an overwhelming reverse of fortune. From the first utterance of Œdipus to the very end of the play the action moves straight on to the goal. The past deed of Œdipus reveals to us the cause of his horror without putting him beyond the pale of our sympathy. The fact that the play received only the second prize furnishes food for thought. What must some of the thousand lost plays have been? No other drama shows mastery to an equal degree in the development of plot. Modern plays can more easily separate plot and character, since new scenes can be introduced and minor parts multiplied. Some of Voltaire's plays are models of ingenious construction; but they are uninteresting, whereas in the 'Œdipus Rex' the highest constructive skill is closely associated with a wonderful delineation of a few characters. The style is rich and flexible, the power of language marvelous. The whole fabric of the drama rests on an improbability, but, as Aristotle says, this falls outside the action of the play.

The scene is before the palace at Thebes. Œdipus comes forth and asks the suppliants the meaning of their frequent cries of dole. The priest replies: "a curse is on our land — Thebes is harried by a pestilence." But the king already knows their ailment. His soul groans for state, for self, for all. He has sent Creon, his wife's brother, to Delphi to learn how he may deliver the state. The messenger arrives and reports that the oracle commands him to drive out the man that slew the former king, Laius. Œdipus promises to search out the criminal. Fifteen Theban elders enter and sing an ode of supplication. Œdipus asks their assistance that he may obtain some clue to track the guilty man: no one is to speak to the murderer, share house, sacrifice or prayer with him. Even if he should prove to be a member of his own household, may the same curse rest on Œdipus himself, if he does not thrust the murderer forth. He avers that he will prosecute the case as for his own father. The chorus protest their innocence, but suggest that Œdipus would not go amiss if he sent for Teiresias. But Creon had already advised this course, and he wonders why the blind seer tarries. At this moment the soothsayer appears. The king entreats him to name the murderer, but Teiresias, loth to speak, turns to go: "I will not proclaim my secret grief — that I say not thine." "Sdeath! you know and will

not tell?" "Your questioning will be vain." "Arch villain! why you would turn a very stone to rage." "What is to come will come e'en if I refuse to unseal my lips." "Were you not blind, I'd say that you did the deed." "You are the man that defiles this land accursed." "Insolence surpassing insolence! How do you expect to escape?" "The truth is my strength. You slew the man whose slayer you seek." "Measureless liar! Not with impunity will you repeat that infamous charge." "You have been living with your dearest kin most foully and knew it not." "Presumptuous priest! Do you think you will say on and on and not smart for this?" Œdipus now inveighs against wealth and sovereignty for the envy that goes with them; his old friend Creon is seeking to overthrow him and grip the general sway by the merit of vile gold, hiring a scheming charlatan, blind in his art, but open-eyed for gain. The seer replies: "In all the world there is none that will be more miserably crushed than you." "Vengeance! Death! Confusion! Damnation seize you! Out of my sight! Ayaunt! Back whence you came and rid me of your presence!" The chorus waver. No prophet can be trusted if he prove false; but Œdipus was shown to be wise when the Sphinx came against him of old. Highly indignant, Creon enters as the king comes forth. After a warm altercation Creon declares that he never had a thought of aspiring to the throne. Jocasta comes out and urges her husband and brother to check their hideous rashness. Turning to Œdipus she bids him allay his fire of passion with the sap of reason: once an oracle came to her from Delphi declaring that the child born to her and Laius was destined to slay his father, but when only three days old the babe was exposed—so the oracle was not fulfilled, for the king was slain by robbers at three crossways. Mention of this spot startles Œdipus. "Who brought the report?" "A slave, the sole survivor. When he saw you crowned King he begged me to send him to the pastures far from town." The queen sends for the herdsman. Œdipus confides to her the story of his past life: "My father was Polybus of Corinth. One day a fellow drunk with wine declared I was not my father's son. I questioned my parents and they were angry at the man and answered me evasively. But the reproach haunted me, and I went to Delphi to ask Apollo, but he dismissed me with words of woe and terror that it was my fate to mate with my mother and slay my sire. I turned, avoiding Corinth, and went where you say the king was slain. There I met a herald and a man in a carriage. They tried to force me from the road. Furious, I struck the driver; but the old man fetched me a blow with his goad. Then I slew all." Jocasta reassures Œdipus: the herdsman cannot retract his story; besides, Apollo predicted the death of Laius at her child's hands.

The chorus sing an ode on the sanctity of the eternal laws that wane not away. A messenger enters. He brings good news: Polybus is dead, and the people desire to crown Œdipus king of Corinth. But Œdipus refuses: while his mother, Merope, still lives, he cannot hope for peace. The Corinthian then informs the king that Polybus and Merope were not his parents, for he had received the babe Œdipus from

a herdsman, in the winding glens of Cithæron, his ankles transfixd with spikes—hence his name "Swellfoot" (Œdipus). The king gives peremptory orders for the herdsman to be brought. Jocasta rushes into the house, and Œdipus is obliged to resort to rigorous measures before the old man consents to tell the truth: the queen had given him, Œdipus, as a babe, to expose on a mountainside, because she was afraid of the prophecy that he would kill his father. "O light, never will I look on thee again. Born accursed, living sinfully with those I should not, and murderer of my sire!" With these words Œdipus rushes into the palace. Jocasta has already realized that she can live no longer. She alone had discerned the whole truth and recognized that the awful dénouement was coming. For dramatic skill and power hardly any other drama contains any thing so fine as her exit. After the choral song a messenger comes out: "Oh, what deeds, what grief! Jocasta's dead. She rushed to her bridal bed, clutching her hair and calling on Laius. Then in burst Œdipus. To and fro he rushed begging for a sword and calling on his wife who was no wife. With a dreadful cry he sprang to the door, forced the bolts and rushed into the room. There he beheld his wife hanging in a noose of twisted cords. With a cry of woe he loosed the knot. Then from her vesture he tore the brooches and drove them full into his eye-balls, shouting: "No more shall ye behold the wrongs I suffered and all I wrought." Many times he smote and at each blow a dark shower of blood drenched his beard. "Look! The gates are opening." As the musicians play an overture, Œdipus comes forth: "Oh, how my soul is pierced by the stings of the sorrows I never can forget! O take me away, the damned, disgraced, accursed. O Cithæron, why didst thou shelter me? O ye three roads and secluded glen that drank my blood shed by these hands from my father's veins! O nuptials, ye brought me into life and produced fruit from the same soil—fathers, brothers, sons, brides, mothers, incestuous acts and all the foulest sins that men can name!" Creon enters and tells the wretched king that he has not come to cast reproaches. Œdipus entreats him to bury Jocasta with due rite: "but my two hapless, helpless girls—do thou care for them. If I could but touch them—O ye gods, do I hear them weeping? Are my darlings here? Come to these brother arms. I can but weep for you. To what gatherings will you go and not come home in tears? Wickedness and crime of every sort are here—your father slew his father, wed his mother and got children of her from whom he sprang. O Creon, do not suffer your poor little nieces to wander about as helpless waifs. They are so young and tender, so delicate." Creon finally prevails upon the unhappy man to go within. As the chorus march off they bid all behold how the mighty have fallen and the play ends with the Greek truism: "Count no man happy until he has reached the goal of life."

Œdipus is the ideal hero of all tragedy. He accords with Aristotle's conception of such a character—one not without human weakness, yet by no means a thoroughly bad man. The play also meets Aristotle's requirement that the reversal of situation should accompany the

recognition of identity of persons. In no other drama is the tragic irony so manifest. Œdipus himself opens the investigation which is to bring about his own destruction. The first disclosure is made in his wife's reassurance, and the last link in the chain of evidence is his examination of the chief witness, the herdsman. Apollo's oracle came to fulfilment. Human wisdom was proved to be foolishness with God.

King Œdipus is of all Sophocles' tragedies the one in which the unexpected plays the most prominent part. As soon as the investigation begins, the revelations come in throngs. What produces the great dramatic beauty of the play is the effect made on the chief character by these successive accusing revelations. No other dramatist has succeeded in an equal degree with Sophocles in portraying a great soul, overwhelmed with grief and suffering, bitterly meditating on its destiny and manifesting in the midst of tears firmness of judgment, consciousness of rectitude and majesty in the most terrible moral distress.

JOSEPH E. HARRY,
Lecturer on the Greek Drama at the Sorbonne;
Author of 'The Greek Tragic Poets,' etc.

ŒDIPUS TYRANNUS, tî-rân'ûs, ("Œdipus the King," the greatest drama by Sophocles (q.v.), played first at Athens about 415 B.C. (See ŒDIPUS.) It is considered the most representative of the Greek tragedies; and as such had very considerable influence upon subsequent Greek literature and upon European literature during the long classical period. The same theme was treated in Latin by Seneca, in English by Dryden and in French by Corneille, Voltaire, Chénier and Lacroix. The scene of the story is laid in Thebes which is being scourged by a fearful pestilence, which can be driven forth only by the punishment of the murderer of Laius upon whom a curse has been invoked by Œdipus. The plot gradually leads Œdipus to a realization of the fact that he himself, though he did not know it, is the murderer of his father. In horror at the revelation Œdipus blinds himself and begs Creon to send him into banishment.

OEHLenschläGER, é'lën-shlâ-gër, or **OEHLenschläGER**, Adam Gottlob, Danish poet and dramatist: b. Vesterbro, near Copenhagen, 14 Nov. 1779; d. Copenhagen, 20 Jan. 1850. He was son of the organist of the Danish royal palace at Fredericksburg; began to write poetry at nine; attracted the attention of Storm, who assisted in the boy's education; made unsuccessful ventures in commercial life and as a comic actor; and under the patronage of the Oersted brothers (qq.v.) again devoted himself to study and to literature. Strongly imbued with the spirit of the Old Norse sagas and with modern German romanticism, his first published poems, 'Digte' (1803); 'Tors Reise til Jotunheim'; 'Vaulundurs Saga' and 'Aladdin, eller den forunderlige Lampe,' gained him a national reputation at 26 and won from the government a pension for foreign travel. In Halle, where he lived with Steffens, he wrote the great historical tragedy, 'Hakon Jarl'; and upon his return to Denmark was elected professor of æsthetics in the University of Copenhagen (1810). His best work was done by 1830, the later volumes being far below the average. Oehlenschläger is the great national poet of

Denmark, a leader of the romantic movement, who did much for renewed interest in early Teutonic and Norse literature and legend and who was spiritually akin with the English romanticists of the first half of the 19th century. It is perhaps as a dramatist that he is of most importance in Danish literature, though his dramas show more strongly epic and lyrical qualities than dramatic. This however is a general characteristic of the Romantic movement of this period. They are important on account of their really national spirit and the fact that most of them have for their themes the popular sagas and folktales of the Norse countries to which Oehlenschläger's work gave a new life and a peculiar interest which has continued to grow since his day. Oehlenschläger's 'Aladdin' is accessible to the English reader in the excellent version by Sir Theodore Martin (1863). His other important works include 'Correggio,' a tragedy written in German (1809)—it is to be noted that Oehlenschläger himself translated all his works into German—a Norse romantic cycle 'Helge' (1814); another Oriental theme, 'Ali og Gulhyndi'; the tragedy 'Stärkodder' (1812); the poetic cycle 'Frederiksberg' (1817); the tremendous epic 'Nordens Guder' (1819), to which 'Hakon,' 'Baldur' and 'Tors Reise' paved the way; 'Erik og Abel,' a tragedy (1820); and 'Dina' (1842), almost the only one of his late works with a gleam of the old fire. See AXEL and VALBORG; HAKON JARL.

Bibliography.—Arentzen, K. A. E., 'Baggesen og O.' (8 vols., Copenhagen 1870-78) and his 'Biography of Oehlenschläger' (Copenhagen 1879); Andersen, Wilhelm, 'Oehlenschläger, et Livs Poesi' (3 vols., Copenhagen 1899-1900); Brandes, George, 'Gesamelte Schriften' (Vol. II, Munich 1902); Nielsen, Rasmus, 'Biography of Oehlenschläger' (Copenhagen 1879); Oehlenschläger, A. G., 'Meine Lebenserinnerungen' (4 vols., Leipzig 1850); Sergel, Albert, 'Adam Oehlenschläger in seinen persönlichen Beziehungen zu Goethe, Tieck und Hebbel, nebst einer Oehlenschläger-bibliographie' (Rostock 1907). Several of these have been translated into English.

OEHLER, é'lër, Gustav Friedrich, German theologian; b. Ebingen, Württemberg, 10 June 1812; d. Tübingen, 19 Feb. 1872. He studied at Berlin and Tübingen and subsequently taught at Basel and Tübingen. In 1840 he became professor in the theological seminary in Schöndal, was appointed professor of theology at Breslau in 1845 and in 1852 he became head of the theological seminary at Tübingen. He opposed the union of the Lutheran and Reformed churches, and he held aloof from the old Lutheran party, while subscribing to confessional Lutheranism. He was one of the most prominent Old Testament scholars on the conservative side. Among his works are 'Introduction to Old Testament Theology' (1845); 'Outlines of Old Testament Knowledge' (1854); 'Relation Between Old Testament Prophecy and Heathen Soothsaying' (1861); 'Old Testament Theology' (1873-74), English translation (1874-75), and 'Manual of Symbolism' (1876). Consult Knapp, 'Ein Lebensbild von Oehler' (1876).

OEHME, é'më, Ernst Erwin, German painter: b. Dresden, 18 Sept. 1831; d. 1914;

son and pupil of Ernst Friedrich Oehme, the landscape painter. He attended the Dresden Academy of Art, and for a short time worked under Ludwig Richter; after which he made an artistic tour through Germany, Switzerland, England and France. He painted, in oils and water-colors, landscapes, architectural views, genre and portraits. The Court Theatre at Dresden was decorated by him; a series of tapestries was also painted by him in water-color, in imitation of Gobelin tapestry. His 'Stone Quarry in Saxony' (1860) is in the Dresden Gallery; and he executed for Queen Carola of Saxony a collection of views of Compiègne. The most important of his remaining pictures include 'Funeral in Spreewald'; 'Bear Hunt' (in water-colors); 'The Valley of Montafont.'

CEIL-DE-BŒUF, é'y'-dē-bél (ox's eye), a small round or oval window. Such a window in the palace of Versailles gave the name *Salle de l'Oeil de Bœuf* to the king's ante-chamber. Since the Renaissance the window has been used frequently with decorative intent as in friezes along the upper parts of buildings, and it is largely with such significance that the term is used in English.

OELAND, é'länd, Sweden. See ÖLAND.

OELWEIN, ôl'wîn, Iowa, city in Fayette County, Iowa, on the Rock Island and Pacific and on four lines of the Chicago Great Western railroads, about 65 miles in direct line west by north of Dubuque. It was settled in 1873 by August Oelwein; was incorporated January 1888, and chartered as a city March 1897. It is in an agricultural region but it has considerable manufacturing interests. The Chicago Great Western Railroad has repair shops there. The government is vested in a mayor and a council of eight members, who are elected biennially. The city owns and operates its waterworks. Pop. (1920) 7,455.

CENANTHOL, ē-năn'thōl, in chemistry, a product of the dry distillation of castor-oil preferably in a vacuum. The immediate product of the distillation is mixed by shaking with a solution of carbonate of potash and then heated, when cenanthol ($C_{18}H_{36}CHO$) separates as an oily colorless fluid with a strong aromatic odor, slight solubility in water, a boiling point of $155^{\circ}C.$, and at $17^{\circ}C.$ a density of 0.827. By oxidation of cenanthol, or by direct oxidation of castor-oil, cenanthylic acid ($C_{18}H_{36}COOH$) is prepared; this is a fatty volatile acid, the esters of which were formerly supposed to give wine its odor, although it is now known that this odor is due to a mixture of esters of capric and caprylic acids.

CENANTHYLIC ACID, one of the volatile fatty acids. See **CENANTHOL**.

CENEUS, ē'nūs, in Greek mythology, the king of Pleuron and Calydon in Ætolia. He was the husband of Althæa, and by order of Diana his country was ravaged by the Calydonian boar. He was dethroned and imprisoned by the sons of his brother Agrius, but was rescued by his grandson, Diomedes, who restored the kingdom to his son-in-law Andræmon, Ceneus being then too old to rule. He was afterward killed by the sons of Agrius. The city of Cenoë was built over his burial place. Legend says he received the grape vine from

Bacchus; hence the juice of the grape was called "oinos," the Greek form of his name. Consequently he is the reputed introducer of vine culture into his own land, from whence it spread first over all Greece and then over the civilized world.

CENONE, ē-nō'nē, a nymph, daughter of the river-god Cebren, or Kebren, and wife of Paris. She was gifted with powers of prophecy and warned Paris not to undertake the journey which resulted in the rape of Helen. Upon his refusal to heed her cautions she told him that she alone could heal him if he were wounded. Angered by the faithlessness of Paris, however, she refused to minister to him when he returned after the fall of Troy, although some accounts state that her father would not permit her to heal him. Paris returned to Troy, where he died. Cenone, repenting, or escaping from her father's authority, hastened after him with medicines, but arrived after his death. Frenzied with grief she is supposed to have cast herself upon his funeral pyre; while other accounts represent her as flinging herself from a tower, or as hanging herself. The story is told in Ovid's 'Heroides' (v) and in Tennyson's 'Enone' (1832).

CENOPIDES, ē-nōp'i-dēz, Greek astronomer: b. Chios, 5th century B.C. He is reputed to have studied under the Egyptian priests, and is said to have known of the obliquity of the ecliptic. Ælian credits him with inventing the cycle of 59 years in order to make the lunar year accord with the solar year.

CENOTHERA, a genus of plants of the family *Onagraceæ*, popularly known as the evening primrose (q.v.).

OERSTED, ér'stēd, Anders Sandøe, Danish statesman, brother of Hans Christian Oersted: b. Rudkjøbing, 21 Dec. 1778; d. Copenhagen, 1 May 1860. He studied philosophy and law at Copenhagen and was admitted to the bar in 1799. He became a famous jurist, was appointed Attorney-General in 1825 and drew up the Constitution granted in 1831. He was cabinet minister, 1842-48 and from October 1853 to December 1854 was Prime Minister, his speedy resignation being forced by his unpopular conservatism, a distinct departure from his earlier politics. He was impeached with his entire cabinet, but all were acquitted. Oersted wrote on Hegelian philosophy, on Danish and Norwegian law (1822-23), on Scandinavian politics (1857) and has left an interesting autobiography (1856).

OERSTED, Hans Christian, Danish physicist: b. Rudkjøbing, 14 Aug. 1777; d. Copenhagen, 9 March 1851. His father was an apothecary and the boy assisted him, studied at Copenhagen, where he became assistant in the medical faculty in 1800, traveled in Europe 1801-04 and again 1812-13 and in 1806 was appointed professor of physics at Copenhagen. In 1829 he became director of the new Polytechnic of the same city and in 1850 a privy councillor. His greatest work written in Berlin was the result of experiments on the magnetic needle with the electric current, which established the intimate interrelation of electricity, galvanism and magnetism and which were described in his 'Experimenta circa Effectum Conflictus Electrici in Acum Magneticam' (1820). In 1819

he discovered experimentally that a magnetic needle was deflected by a current in a wire passed over it or below it. This is the earliest recorded experiment in electric magnetism; and is of great importance because it opened the way to many brilliant experiments and finally led to the subjugation of electricity to industrial and other uses. As a reward for this and other experiments and discoveries in electricity Oersted was awarded the Copley medal by the Royal Society of England and the highest mathematical honors of the Institute of Paris. Oersted also wrote a valuable 'Manual of Mechanical Physics' (1844) and various studies in chemistry, physics, metaphysics, æsthetics and popular science, all pervaded with his predominating thought of the unity of sciences and their position as the servants of religion. His style is clear, picturesque and attractive and his works have been popular in the original and in German versions. Oersted endeavored to make scientific subjects popular, and with this end in view he wrote very many periodical articles and numerous books and his university lectures were thrown into popular form. Consult Alexander, C. A., 'Memoir of Oersted' (a translation of Beaumont's life of Oersted, published in the Annual Report of the Smithsonian Institution 1868 and in book form 1869); Hauch and Forchhammer, 'Biography of Oersted' (1853).

OERTEL, ɛr'tɛl, Johannes Adams, German-American Episcopal clergyman and artist: b. Fürth, Bavaria, 3 Nov. 1823; d. 1909. After studying art in Germany he practised engraving until 1848, in which year he set up as a painter in New York. He painted 'Rock of Ages,' which became vastly popular and was reproduced in millions of photographs and chromolithographs. He took holy orders in 1867, has had more than one pastoral charge and was appointed professor of Christian art in the University of the South. He painted a series of four large pictures entitled 'The Plan of Redemption' which he presented to the university. He is also a successful wood carver, confining himself to ecclesiastical and religious subjects in both departments of his activity.

OERTEL, Max Joseph, German laryngologist: b. Dillingen, 20 March 1835; d. 19 July 1897. He was educated at Munich, was docent in laryngology there in 1867-76 and thereafter was professor of that subject. He discovered the diphtheria bacillus in 1868, devised a famous system for the correction of respiratory troubles and invented the laryngoscope. Author of 'Respiratorische Therapie' and 'Therapie der Kreislaufstörungen' in 'Handbuch der allgemeinen Therapie' (1883); 'Ueber Terrainkurorte zur Behandlung von Kranken mit Kreislaufstörungen' (1886); 'Pathogenese der epidemischen Diphtherie' (1887), etc.

OESEL, ɛ'zel, a Russian island. See **ÖSEL**.

OESER, ɛ'zɛr, Adam Friedrich, German painter, etcher and sculptor: b. Pressburg, Saxony, 17 Feb. 1717; d. Leipzig, 18 March 1799. He was trained as a sculptor under Raphael Donner and as a painter, in the Vienna Academy, 1730-39. He afterward was a pupil of Mengs and Dietrich at Dresden where he designed the decorations of the court theatre and

mural paintings in Castle Hubertsburg (1749). In 1759 he went to Leipzig where, in 1764, he was appointed director of the newly-founded art school. Besides his professional activity as a teacher he did a great deal of decorative work and won a reputation as a painter of ceilings. Among other things he executed a picture for the church of Saint Nicholas and a number of minor decorative panels and drawings. As a sculptor he shows to advantage in the statue of Frederick Augustus the Just in Leipzig and of the Danish Queen Matilda in Celle (Aisne-et-Nord). His versatility is proved by his masterly etchings, 45 in number, some after the manner of Rembrandt, some in a highly original style of his own. He was a strong opponent of mannerisms in art and he shared in Winckelmann's efforts after a reform in art through a study of the antique; but his own canvases give little evidence of Greek influence. By his passion for allegorical compositions he is sometimes betrayed into the extravagances of the rococo school. He was one of the great art teachers of his day and among his pupils was Goethe, with whom he kept in touch after the latter had become the leading spirit at Weimar. Among his numerous paintings, which are mainly of religious and mythological subjects and portraits, are 'The Artist's Children' (1766, in the Dresden Gallery); 'Marriage at Cana' (1777); 'The Painter's Studio' (Weimar Museum) and several in the Leipzig Museum. Consult Dürr, 'Biography of Oeser' (Leipzig 1879).

ŒSOPHAGOTOMY, ɛ-sɔf-a-gɔt'a-mī, a surgical operation for the relief of stricture of the œsophagus and the removal of foreign bodies lodged in it, when dilation and other measures are of no avail. There are two forms of the operation, external and internal. External œsophagotomy consists in cutting into the œsophagus in front between the thyroid cartilage and the sternum, and extracting the foreign body with forceps, or dividing the stricture with a knife. Internal œsophagotomy is usually resorted to for the relief of stricture, especially when of cicatricial origin. The stricture is divided by a cutting instrument (the œsophagotome) passed through the mouth. After the operation bougies are used to prevent recontraction. When the œsophagotome cannot be used, or inanition is imminent, gastrotomy or opening the stomach so that food can be given is resorted to.

ŒSOPHAGUS. See **DIGESTION**.

OESTERLEY, ɛs'tɛr-li, Karl, son of Karl Wilhelm Oesterley (q.v.), German painter: b. Göttingen, 23 Jan. 1839. After studying in the Hanover Polytechnic under his father, he went to Düsseldorf (1857), and began under Deger his essays as a religious painter. On a visit in Lübeck (where he copied Hans Memling's 'Passion of Christ,' 1865) he was attracted to landscape and architectural pieces and was so successful in this domain that he thenceforth devoted himself to landscape. Since 1870 he has generally derived his *motif* from Norwegian scenery. His pictures are distinguished for their dazzling color, transparent atmosphere, distinctness in light and texture and grandeur of conception. Among them are 'Midnight near Lofoden'; 'Mountain Gorge in

Norway'; 'Romsdalsfiord'; 'Scene on the Coast of Northern Norway' (1879, in the Museum at Breslau); 'Raft Sound' (1879, Breslau Museum); 'Fishing on the Norwegian Coast,' 'View on Salten Fiord' (1882, Hamburg Gallery); 'Lodenwand on North Fiord' (1885, National Gallery, Berlin); 'Romsdal Fiord' (1891, Leipzig Museum).

OESTERLEY, ẽ'stẽr-lĩ, **Karl Wilhelm**, German painter: b. Göttingen, 20 June 1805; d. Hanover, 28 March 1891. He was a pupil of Matthæus in Dresden, studied in Rome 1824-29, in 1831 was appointed professor of the history of art in the university of his native town and in collaboration with Ottfried Müller published 'Monuments of Art.' Meanwhile he was extending his artistic studies in Düsseldorf, Munich and Paris. On the completion of his picture, 'Christ and Ahasuerus' (1844), he was appointed court painter of Hanover. The chief of his remaining works are 'Jephtha's Daughter' (1836); 'Christ Blessing Little Children' (1841); 'The Ascension' (in the chapel royal at Hanover, completed 1838; 'Scene from Bürger's "Lenore."') He produced also altar-pieces and portraits and designed stained-glass windows.

OETINGER, ẽ'ting-ẽr, **Friedrich Christoph**, German theologian: b. Göppingen, Württemberg, Germany, 1702; d. Murrhardt, Germany, 10 Feb. 1782. He was educated at the University of Tübingen and became reader of theology at the University of Halle. In 1738 he took charge of the parish of Hirschau and gained the leadership of the Pietists in that section. His translation of several of the works of Swedenborg brought upon him ecclesiastical censure, but he was protected by the Duke of Württemberg and latter was appointed superintendent of the churches in the district of Weinsberg. He subsequently held the same position in Herrenberg and afterward became prelate in Murrhardt. He wrote many theological treatises which have been edited by Ehmann, over 70 in all (1858-63). Among these is 'Earthly and Heavenly Philosophy,' which on account of its religious views raised a storm in Germany. Consult monographs by Auberlin (1847), Ehmann (1859) and Wächter (1885).

O'FARRELL, Michael Joseph, American Roman Catholic bishop: b. Limerick, Ireland, 2 Dec. 1832; d. Trenton, N. J., 2 April 1894. He was educated at the Seminary of Saint Sulpice, Paris, and ordained to the priesthood in 1855. He went to Montreal where he was pastor of Saint Patrick's and Saint Bridget's churches and in 1869 accepted a call to New York as assistant in Saint Peter's Church. In 1881 he became the first bishop of the then newly-formed diocese of Trenton, N. J.

OFFA, a king of Mercians in Anglo-Saxon England: d. 796. He succeeded to the throne after Ethelbald, on defeating the usurper Beornræd, 757 A.D. Kent and the East Saxons were brought under his rule, and the power of Wessex was crushed by a defeat in 779. He likewise defeated the Welsh, wrested from them part of their border lands and to retain them within their own limits erected here the rampart known as Offa's Dyke (q.v.). With the consent of Pope Adrian I he raised the see

of Lichfield to the position of an archbishopric; and he had diplomatic intercourse with Charlemagne. Ethelbert, king of East Anglia, was murdered by his instigation and Offa then seized his kingdom. He founded the abbey of Saint Albans, and a grant by him to the see of Rome is supposed to have been the origin of Peter's Pence (q.v.). He promoted trade between England and the Continent. Consult Hodgkin, Thomas, 'Political History of England' (Vol. I London 1906); Oman, C. W. C., 'England before the Norman Conquest' (New York 1910).

OFFA'S DYKE, an ancient earthwork extending along the whole border between England and Wales, said to have been built by King Offa of Mercia in the 8th century, as a boundary between his dominions and those of the Welsh. It extends from the vicinity of Newmarket, in Flintshire, and traverses the counties of Flint, Denbigh, Salop, Radnor, Hereford and Monmouth to Beachey, at the mouth of the Wye. Another dyke of a similar kind called Watts' Dyke runs at distances of from one-fourth mile to three miles apart from Offa's Dyke, in the same direction, through the counties of Flint and Denbigh. These dykes are supposed to mark the neutral ground on which the Welsh and Britons were at liberty to meet for transacting business.

OFFENBACH, Jacques, zhāk õf-ẽn-bāk, French Hebrew composer: b. Cologne, 21 June 1819; d. Paris, 5 Oct. 1880. He entered the Paris Conservatoire in 1833, became proficient on the violoncello and for some time played this instrument in the orchestra of the Opera Comique. Later he was conductor of the orchestra at the Théâtre Français, and in 1855 opened the Bouffes Parisiens, where he enjoyed immense popularity. There were presented many of his most popular works, 'Orphee aux Enfers' (1858); 'Geneviève de Brabant' (1860); 'La Belle Hélène' (1865); 'La Barbe Bleue' (1866); 'La Grande Duchesse' (1867); 'La Princesse de Trebizonde' (1870); 'Madame Favart' (1878). From 1866 he devoted himself entirely to composition. His last opera and the one that he considered his best was 'Les Contes d'Hoffman' (1881), successfully produced at the Opéra Comique after his death. Offenbach was a clever musician; his music is natural and has a verve and swing which made it immensely popular. This, combined with the excellent librettos of all the Offenbach operas and operettas, easily makes their author the master spirit in his own field. He was the originator of the opera-bouffe, and was imitated by many who never attained his melody or comic force. Consult Bekker, Paul, 'Jacques Offenbach' (Berlin 1909); Martinet, 'Offenbach, sa Vie, et son Œuvre' (1892).

OFFENBACH, õf'fẽn-bāk, Germany, town in the state of Hesse, five miles southeast of Frankfurt, on the left bank of the Main. It is well and regularly built, and has an old castle, formerly the residence of the princes of Isenburg, the modern palace of the prince of Isenburg-Birstein, a townhouse, several churches, a synagogue and theatre. Offenbach is the most active manufacturing town in the state. Its industries include fancy leather goods, such as pocket-books, portfolios and traveling bags;

and there are manufactures of aniline, celluloid, perfumery, stearin, vaseline, lacquer and other chemical products, sewing and other machines, and machine tools; paper of various kinds, boots and shoes, type-founding and printing. Offenbach was founded in the 10th century and in 1685 the Isenburg-Birstein family took up its official residence there. Pop. about 80,000.

OFFENBURG, öf'ën-bürk, Germany, city in the state of Baden, on the river Kinzig, 27 miles by rail southwest of Baden and 12 miles southeast of Strassburg. It is mentioned as early as 1100 and became a town in 1223 and a part of Baden in 1802. There are remains of old fortifications and many fine works of sculpture. There are manufactures of textiles, agricultural machinery, leather goods, dyes and cement and the town has some importance as a trade centre. Pop. 16,848.

OFFERINGS AND SACRIFICES, gifts offered to the Deity. Sacrifice differs from almsgiving as a religious service, or from contributions made merely for the purpose of supporting a system of external religion, in being offerings made directly from the worshipper to the Supreme Being. They may, however, under proper authority, be applied to charitable or religious uses; to the maintenance of the priesthood, or to the celebration of solemn feasts.

The origin of sacrifice is a point much disputed; the two opposed views being that of a primæval appointment by the Deity, and that of a spontaneous origination in the instinctive desire of man to draw near to God. The universality of sacrifice has been urged in favor of the hypothesis of a primitive institution by Divine command, but the more legitimate inference from this circumstance appears to be in favor of the opposite view. Of the symbolic character of sacrifice there are various kinds or degrees, all having in common the acknowledgment of dependence on the one hand and of protective power on the other. These may be represented under three heads — (1) propitiatory, or designed to conciliate generally the favor of the Deity; (2) eucharistic, or symbolical of gratitude for favors received; (3) expiatory, or offered in atonement for particular offenses. To a different class may be assigned deprecatory sacrifices designed to avert the arbitrary wrath or appease the wicked disposition of deities.

The origin of the Jewish sacrifices is traced to the earliest times. We are told in the book of Genesis (ch. iv), that "in process of time" Cain and Abel brought each an offering to the Lord, and the different characters and results of these offerings are recorded. After the flood Noah offered a sacrifice "of every clean beast and of every clean fowl," an apparent intimation that the distinction between clean and unclean animals had already been made, and consequently of a prior Divine appointment of sacrifice. Abraham, Isaac and Jacob offered sacrifices in which appeared a circumstance peculiar to the Jewish economy, that of a covenant between the offerer and the Divine being, of which the sacrifice was accepted as a sign. When Moses demanded the manumission of the Israelites from their bondage in Egypt, the plea which he presented to Pharaoh was that they might go three days' journey into the wil-

derness to sacrifice to the Lord. It was when the deliverance had actually taken place, and during their sojourn in the wilderness, that the Jewish ceremonial law with its elaborate ritual of sacrifice was given (accepting the ordinary traditional view regarding the so-called Mosaic legislation). The details of this ritual, with its surrounding observances, are amply set forth in the book of Leviticus. The burning upon the altar of animals is among the commonest of the forms of sacrificial rites both among the Jews and Gentiles. The Jewish sacrifices consisted mainly of burnt-offerings (of clean animals) daily, with double offerings on Sabbaths, and special offerings at festivals, unlimited in extent, and which, being partaken of by the people, were called peace-offerings. Such sacrifices, called hecatombs, were also common among the Greeks and Romans. Meat-offerings (of flour, oil and wine) accompanied the burnt-offerings. Sin-offerings (various) at special feasts and at each new moon were general expiatory offerings, besides which trespass-offerings were made privately on certain specified occasions, as well as in expiation of particular offenses. The most remarkable sin-offering was that of the two goats on the great day of atonement. Incense was offered every morning and evening. Offerings were made separately, first for the priests and afterward for the whole people. What is most noteworthy about the Jewish sacrifices was their restriction to one particular place, the tabernacle, and later the temple (but consult Ex. xx 24). Offerings on high-places were forbidden, and are always noticed with reprobation as the indication of a rebellious spirit. The view of Maimonides among the Jews, and of Warburton and others among Christian divines, was that sacrifices were not so much divinely appointed, as divinely permitted under restraints among the Jews, "lest," as it is expressed by Ephraim Syrus, "they should despise a naked religion and attach themselves to false gods." It is added, in support of this view, that when religion was more fully established the prophets constantly deprecated sacrifice, but this is hardly a fair account of what the prophets did. The prophets, indeed, with one voice unite in affirming the views of sacrifice represented by Samuel in his exhortation to Saul, that "to obey is better than sacrifice," and of our Lord, who, according to Saint Matthew, repeatedly cited the authority of the prophets for the saying that God will have mercy and not sacrifice, but it is clear that these statements were not directed against the established usage of sacrifice, but against an unreasonable reliance on it as a substitute for moral virtues.

The sacrifices of the Gentile nations were the result of natural impulses developed by tradition, or cultivated by priestly care into a system. The powers of nature, or the most prominent objects, celestial or terrestrial, in which those powers resided, were commonly their exciting causes; while the terror of natural convulsions, and still more the disorders and miseries of human life, conjured up malevolent beings, whose wrath was only to be deprecated by blood, and sometimes by the blood of those dearest to the offerer. Not animals alone, but slaves and captives, were sacrificed freely. Among many of the Eastern nations surrounding the Jews human sacrifices were common.

particularly among the Phœnicians. Some traces of this custom may be found in legendary times even among the Greeks and Romans. Numerous legends hang upon the circumstance that the wrath of some divinity is only to be appeased by the sacrifice of a human victim to be recognized in some special way, or sometimes of a continued series of such victims. In one other respect only do the heathen sacrifices, including those of the Greeks and Romans, demand special notice, as differing materially from those of the Jews in the frequent inclusion among them as a sacrifice acceptable to the Deity of the chastity of women. This is always denounced in the strongest terms by the Hebrew prophets. The sacrifices of the Greeks and Romans, like those of the Jews, were either bloody or bloodless, the former usually accompanied by libations of wine and by incense. They were frequently used as a means of consulting the gods, procuring omens, etc., and for political purposes.

Of the universality of sacrifice the annals of almost every people bear record. The ancestors of nearly all the existing races in Europe practised human sacrifices, and similar usages widely prevailed in Africa and America, as well as in Asia. Few religions, whether ancient or modern, have omitted sacrifices from among their rites. The Buddhists offer only first-fruits and flowers; the Mohammedans give alms, but offer no direct sacrifices. The Roman Catholic, Greek and Anglican churches make the service of the Eucharist a service of sacrifice each in a somewhat different sense or degree. The introduction of Christianity had the effect of indirectly putting an end to Jewish sacrifices, and of directly abolishing heathen sacrifices in the Roman Empire. These latter were prohibited by the Emperor Theodosius in 381. It was this final destruction of the temple by the Romans that abolished the Jewish sacrificial system which had been limited to its precincts.

OFFERTORY, in the Roman Catholic Church, is that portion of the service of the Mass in which the priest offers to God upon the altar the bread and wine which are to be consecrated. In the music of the mass the term offertory is used to designate the antiphon or music appropriated to that part of the service above designated. In the Anglican Book of Common Prayer the term offertory is applied to that portion of the service during which the alms are collected among the people, whether during the service of the Holy Communion or not, while certain prescribed sentences from Scripture are being said or sung. The alms are then offered by the officiating clergyman, being laid on the altar usually with an ascriptive address to God. When the Lord's Supper is celebrated the unconsecrated bread and wine are offered at the same time. In general the term offertory has the modern sense, in Protestant churches, of the collection of money made at a religious service; and it is also used to designate the music rendered at the same time.

OFFICE, Divine (Lat. *Officium divinum*) in the Roman Catholic Church, a general designation since the 9th century for the services of the canonical hours (q.v.). These services or offices are prescribed to be said each day by bishops, priests, deacons and subdeacons in the

Roman Catholic Church. See **BREVIARY**; **LITURGY**; **MISSAL**.

OFFICE, Qualifications for. See **ELECTORAL QUALIFICATIONS**; **TERMS OF AND QUALIFICATIONS FOR OFFICE**.

OFFICE LABOR-SAVERS. Man goes from barbarism to civilization by learning to do things better, quicker, easier or cheaper. Some labor-savers combine two or more of these improvements. America leads the world in prosperity because it led in adopting standard sizes for machine parts and in other labor-saving methods and devices. Obviously by as much as services of high salaried desk workers are more valuable than those of mechanics, by so much are literary labor-savers worth more than highly prized machines of manufacture and commerce. Yet it was not till the Library Bureau was founded in Boston as part of the national library movement started in 1876 that this was practically recognized. Since then there has been marvelous development, till now a device for saving time, labor or money in office, library or study is valued as highly as one for factory, shop or farm.

Hundreds of ingenious, practical labor-savers for technical uses will be urged by their promoters. Electric tabulating, computing, bookkeeping, addressing and other machines illustrate immense savings possible by devices, as important to desk workers as sewing-machines to seamstresses or modern tools to mechanics. If we admit that time and labor should be saved for brain work as for hand work, then the minutest saving is worth attention. Many factories make their entire profit by using an improved method or machine, or by utilizing waste in some by-product. In large offices, a method by which 4 motions do what formerly took 5 saves a large yearly aggregate in salaries.

Writing and Printing.—Writing is easily greatest of human inventions. All nations in traditions attribute to it divine origin. Some 5000 years ago Egyptian priests evolved pictures of things into ideograms or pictures of abstract qualities and ideas, then pictures for sounds of words or syllables (where some Eastern languages still stop); and finally pictures for sounds of final elements or single letters. These were written on stone, horn, clay, metal, wood, wax, bamboo, birch-bark, skins and papyrus, till we reached that wonderful product, paper. The first writing implement, of flint, was followed by stylus, fine brush of hair, split reed, quill, steel and gold dip pens, now in turn superseded by fountain pens and typers. After writing, the ancients invented abbreviation systems as labor-savers. Then came for cursive writing faster small or lower case forms of letters. Taking less space and being both written and read quicker, they will in time displace capitals entirely and avoid the foolish waste of having to learn two alphabets.

Avoid capitals. They take more time and space, are less legible. All recognized experts advise against them, and the best printers are cutting them out more and more. In signs, labels, bulletins, etc., lower case can be read easier and farther; for the small forms with their ascenders and descenders have been

proved by the marvelous instruments in psychologic laboratories to be much more legible. The uneducated tend to sprinkle their writing full of capitals. The next step was greater abbreviation and greater simplifying of forms by stenography, revolutionized and systemized by Isaac Pitman. (See SHORTHAND). The greatest invention after writing was printing, followed by telegraph, cable, telephone and wireless, which show what the human mind has already done and suggest future possibilities.

Model Office or Study.—A southeast corner room is best; north light is most uniform; west least desirable. Hygiene forbids carpets in public rooms. Use hardwood floors, or corticine, which is cheap, durable, easily washed, deadens noise and is warm. Atmospheric steam is best for heat. It is regulated as easily as hot water, heats or cools much quicker and is free from danger of freezing. For ventilation, have both inlet and outlet flues, with open fire if practicable. If not, insure circulation through flues by gas jets, steam pipes or motor fans. Desks should have window at left so the hand will not shadow the writing. Left-hand writers would reverse this rule. Roll-tops darken the desk, tempt to disorder and are forbidden in some offices. The roll, if used, is better over pigeonholes, which are best in front of the chair if one has many papers, as this allows most boxes to be reached quickest. Open pigeonholes allow quickest work, but catch more dust than drawers and take more space than vertical files, which hold on edge papers, pamphlets and clippings, and are cleanest, cheapest and best for most storage. Space not needed for pigeonholes in front and all under the desk is best used for vertical files or drawers. Telephone and desk lights (with metal shade to protect eyes), on arms, swing aside when not in use, and save desk space. Standard size pigeonholes, drawers, trays and shelves fill all blank wall space at left and behind, within reach from the swivel-and-spring desk chair.

Chairs with curved spring back give a grateful support to tired backs. Upholstered chairs are heating and sometimes dangerous.

A model desk is 78 cm high, not 75 as usual. Short men can use higher chairs but tall men cannot cut off their legs. The higher desk is better for eyes. Many stoop over desks because they are too low for natural eye focus.

Drawers run to floor without baseboard and clear through to back have side runs with no cross pieces and at no extra cost, give easier action and maximum storage. All drawers are at least 9 cm deep inside to hold standard card trays. A desk 78 cm high with no cross bars gives 1 drawer for V size, 4 for P and 1 for Q (see p. 601).

The middle opening for the feet is at least 60 cm wide with a centre drawer over it holding 50 by 60 cm sheets for large charts and tables. Above drawers each side are slides as long as width of top allows. On small desks may be added to either end extension leaves supported by folding brackets. Tops are 60 to 100 cm wide; 150 cm (60 in.) is the longest top whose ends can be easily reached from the chair.

Office bells are buzzers, not single stroke,

to allow simpler codes of time-saving signals. Buzzers allow short and long signals like telegraph dot and dash. Barometer or fountain sponge cup and mucilage stands save labor. Use only inkstands like Perfect or Capitol that prevent evaporation and so require no refilling till ink is all used. Self-inking rubber stamps for any words or dates often written save much time and give more distinct entries. If several are used keep in racks plainly labeled, or it takes as long to find the right one as to write the words. A metal straight edge exactly P size is much quicker than shears and ruler in fitting clippings and parts of sheets for trays.

Blanks.—Have printed blanks for everything much used, with alternatives both printed so that instead of filling in words, a single stroke crosses out those not wanted. Printing is cheap, clerical labor costly. A letter sheet with months at the head of 12 columns, ruled with 31 numbered lines, gives a square for each day in the year and is invaluable for statistics or records. Each sheet is thus a diary for 2 years. As they cost perhaps 1c, they may be used almost as freely as blank paper. For longer, or 2 or more column, entries use 6, 3, 2 or 1 month to the page, thus giving needed room for tables. Where summaries and charts are needed for shorter periods than a month use decimal blanks, i.e., decades instead of weeks. Leave a blank line for footing after each 10 days. This total is also day average by moving decimal point. In 31 day months it gives 3 decades and 1 single day, so every sheet shows, without figuring, totals and averages for each 10 days and also for the month. If working by week much duplicate figuring is necessary because except in February month and week have no common divisor.

Writing.—Vertical writing disjoined is more like print and some can write it as fast as sloping hand, which is so much less legible that libraries prohibit it on catalog cards.

Ink should dry naturally, blotting blurs sharp lines of writing and takes away some color.

Envelopes.—Odd size envelopes are a nuisance and go less safely in mails than standard sizes, as they project and are torn or crumpled by post office when tied in bundles. For notes and post cards use No. 5; for Q or 4P sheet (15 x 25 cm) No. 6¾; for letter-sheet No. 8½; if enclosing these, use No. 9. Never use for manuscript a sheet wider than 20 cm. Science proves this line much too long for easiest reading. The best width of paper is about 15 cm.

Typers.—As typing is more legible, easier, faster and cheaper, thus combining all 4 labor-saving elements, it is foolish and costly to allow clerks to write by hand. Many high salaried men have learned that ease and speed make it wise to type such writing as they do with their own hands. If one writes at all, by as much as his time is more valuable than a \$10 clerk is the typer worth more for his personal use. Visible typers have driven out the blind and remove a serious objection, as each letter is in sight as written. By touch system in growing use, operators never look at keys but strike right ones by touch, like a skilled pianist. See TYPEWRITER.

Fountain Pens.—Dip pens are as absurd for a constant tool as a muzzle-loading rifle for a modern soldier. Thousands have tried fountain pens and discarded them as failures, when they would have found them invaluable by observing these rules: (1) Select from a full line a pen exactly suiting your hand. More than 100 varieties of each first-class pen are regularly made. (2) Keep gold pen bright by cleaning it often on a wet sponge. (3) Use free-flowing standard ink, preferably filtered. Never mix inks or fill from a bottle open to air and dust. If clogged by poor or mixed inks or dirt, soak barrel and feeder thoroughly in water or wash out with alcohol. If you wish different colors for checking, black, red and blue are best. (See *Colors* below). (4) To avoid top-heavy effect for sensitive hands, do not put cap on top of holder when writing. (5) Buy a make of pen of established reputation. \$1 watches occasionally keep good time but no one expects it. \$1 pens will usually disappoint. Large holders are easier to sensitive hands. Prove this by holding a knitting needle or very small pencil. Instead of the common clip, it is much quicker and as safe to sew the deep watch pocket into 3 or 4 narrow pockets. If you carry pens not clearly distinguished at a touch by size, buy different shaped caps or have lines cut on the cap so touch tells you instantly which pen it is without looking at it. Use your fountain pen constantly. If kept for traveling or use away from the desk, it will not work as well. To use a dip pen for any purpose is as silly as to refuse to use a telephone or other modern labor saver.

Duplication.—Copying by hand was costly and untrustworthy. The copypress banished it and in turn this was largely superseded by rubber roller copiers, worked as easily as a clothes wringer and giving, without copying ink, 5 or more good copies if needed. This has given way to the carbon sheet, usable with pencil or stiff, smooth-pointed pen, but best with typer which makes with one writing 10 good copies on thin paper, or on cobweb paper 15 to 20. The best duplicator is the stencil typed on wax paper or a substitute and printed on a simple press giving 1,000 copies, if needed, as permanent as other printing. A tiny motor attached to any electric light furnishes power. As wax is costly, many use pans of composition on which anilin ink from pen or typer ribbon offsets. These use only common paper, are cheapest and quickest for temporary use if more copies are wanted than can be carboned, but anilin ink soon fades. A practical duplicator is a great labor-saver to desk workers, most of whom often greatly need extra copies that time and cost forbid printing.

Card System.—This is easily chief of literary and business labor-savers. With the modern library movement dating from 1876, its growth has been phenomenal and the saving effected is more than money can measure. Instead of bound books, separate cards or sheets are used, on edge with frequently projecting guides, which enable one to find any item almost instantly in its exact alphabetic or classified place.

Matter may be added or removed at any point without recopying or disarrangement, so

that material is always up to date. The plan is invaluable for every growing record, and has been adopted successfully for thousands of uses. Its usefulness is diminished or destroyed unless cards are cut to more exact height than common machines allow. A minute variation results in "bridging," that is, a low card between two higher ones is missed by the finger in turning. The best patterns of trays, supporting blocks, and locking rods are necessary to give greatest speed in reference. Most patent devices for these purposes are useless. Library experience has shown what gives best results.

Sizes.—The international standard P or postal size card is 7.5 cm. high, 12.5 wide. The U. S. government prints its postcard, size K, and all its catalog cards on this size, and the National and International Library and Bibliographic societies use this standard, which has in 43 years established itself beyond possibility of change. It is enough smaller than 3 x 5 inches, for which the inexpert often mistake it, to make inch cards worthless in a standard index. They must be recopied or cut down to standard size at large expense, or serious trouble results. However glibly recommended by salesmen who know little beyond their desire to sell, never use 3 x 5 inch cards which grew out of ignorance of international standards, for it is impossible to mix these 2 sizes.

This P size is very often found better to use in place of larger sheets for short bills, receipts, bank checks, etc., as they can be handled much quicker. The saving of space occupied seems trifling, but grows serious. Originally cards were over 3 times as large and were kept in a single row of covered boxes. Gain in number of cards stored on a given floor space was 3-fold when 3 rows of drawers replaced these boxes and 15-fold for standard cases 15 rows high; 2-fold more when cards were made half thickness, 2-fold more with trays twice as long. Thus 180 times as many cards are stored on given floor space. Single column trays with sides cut down to give more light and with label-holders in the pull are better than the heavier 2-column drawers. In a standard unit case of 2 to 3 pigeonholes wide, 15 high, each hole 9 x 29 cm and 50 cm deep, just holds 2 standard trays. Between rows 6 and 7 are slides on which to rest drawers from pigeonholes too high or low to allow convenient reading. Short desk trays 25 cm long with sides and partitions, if any, only 5 cm high, give better light and easier handling than if full height of cards. All desk drawers should be full 9 cm deep to hold these trays. All cards have an 8 mm hole near the lower edge, in the middle. For private use locking rods needed in public indexes may be omitted, but the hole is often needed to tie cards together or for special uses. Rods are to prevent removal and loss, so a notch in place of a hole is bad, as cards can be bent a little and readily removed without tearing.

A pocket binder with eyelets opposite the card holes and a tie cord and bar is handy to carry cards. The best card stock, weighing 200 grams to a square meter, is as good as the older 300 or 400 gram stock which took twice the space. Heavier cards are needed

only for guides. These with projecting tabs double usefulness. Cards as well as guides can be had with these tabs, affording immense possibilities of double, triple and quadruple classing by tab, card color, ink color, and number or heading. For lighter cards 133 gram or 28 lb demy stock, $\frac{2}{3}$ the weight of the light standard, is best. With it 300 times as many cards can be put in a floor space as with old outfits. 100 gram stock, 5 lb commercial note-paper, is used where space saving and cheapness are more important than ease of handling.

The largest standard card index is L size, for cards 25 cm high by 20 cm wide. The drawers are 21.5 wide and 28 cm high inside, and outside are 27.5 x 30 cm by 60 cm long. They have rods and blocks with sides cut away like P size, but drawers are on extension slides so they can be opened full length. The unit is 4 drawers high from the floor, the highest that can be readily consulted standing. The best low unit is two L drawers high with a P drawer and an extension slide and table top above, making a case 78 cm high, 32 cm wide and 50 cm long. This stands at the end of a desk as an extension, or better at right angles, so all cards may be read without rising from the chair. Heavy manila guides 27 cm high have tabs 4 cm wide projecting 1 cm higher. Another projection from middle of bottom runs in a groove in drawer bottom and has a stout eyelet thru which locking rod runs, a necessity for so large guides. For these large sheets 2 folios not used in P size are needed. A manila envelop 20.5 x 25.5 cm, open at the top and right side, holds together stiffly enough to hold thin papers on edge. The long folder is of manila 20 cm wide, 51 cm long, folded with front 27 cm, back 24 cm high. In the top, smaller subdivisions than indicated in projecting tabs of guides are written and closer classing of papers is maintained. Manila, white, blue, buff and other colors are used for these folios when more than one classing is wanted in the same series, e.g., personal papers mingled with office or firm papers on the same subject. Thus papers belonging to several different parties can be closely clast together by subjects without confusing ownership which is instantly recognized by folio color. This L size index fits most magazines, pamphlets, letters and typed documents and is the best working unit for all papers too large for P trays. It is better than filing on long edge because papers may be read in the drawer with letter-heads, titles of articles, etc., at the top in the best light, exactly like library catalogs. The more widely used commercial vertical files, 12 in. wide, 10 in. high are slower in use because papers are kept on sides instead of ends and folios must be lifted out and opened before consultation. So many use objectionably large sheets with a line too long for easy reading that the larger file will be used commercially till we learn the advantages of never using a sheet larger than 20 x 25 cm. For all other uses L size drawers and files are better. When letters or papers on larger size come in, they are quickly folded once or margins cut down with photo cutter and dropt into regular place.

For one seeking maximum efficiency for great quantities of notes, pamphlets, clippings and papers of the most convenient working

size, to use commercial letter files, 12 x 10 inches, is like using a card catalog tray big enough to hold business envelopes on end. It wastes space, works badly because of loose fitting and chiefly has lines running perpendicularly instead of horizontally as they must be read.

Intermediate sizes are seldom needed. B or billet (10 x 15 cm), N or note (12.5 x 20 cm) are largely used, but a single size, D or double P (15 cm high by 12.5 cm wide), is best and has the great advantage that a single fold makes it exactly fit standard P trays now universally used. Large sheets for card index stock 50 x 60 cm save waste so aliquot parts of this are best. 99 times out of 100 P, D, Q or L size will be best. Odd sizes cost more and waste badly when indexes are combined or re-arranged. If other sizes must be had for special use, choose from this full series:

Symbol	Name	Size in cm.
V	Visiting card	5 x 7.5
H	Half P	6.25 x 7.5
I	Index	5 x 12.5
P	Postal	7.5 x 12.5
B	Billet	10 x 15
D	Double P	12.5 x 15
N	Note	12.5 x 20
Q or 4P		15 x 25
L	Letter	15 x 20
2L	Double letter	25 x 40
4L		40 x 50
S	Standard	50 x 60

Recent experiments confirm the theory that the most pleasing proportion in a sheet or pamphlet is in the ratio of 1 to $\sqrt{2}$; i.e., 1 to 1.414 or nearly 5 to 7. This has the advantage of always keeping the same ratio with successive bisection, so paper can be cut to any size in the series without waste. This would change the standard large sheet from 50 x 60 to 50 x 70.7 cm and standard letter size to 17.7 x 25 cm, a better length of line, while height still fits standard library shelves. The P card is so firmly established thruout the world that it could not be changed.

Arrangement in any card system is either A to Z, like a dictionary, or 1, 2, 3, or clast, both numeric and clast plans having alphabetic indexes on P cards. The numeric system is best for correspondents writing many letters or for special contracts or other business distinct but not obviously clast under any subject or name. Use short numbers 1 to 9 or 99 for heaviest correspondence. Assign and index the rest as subjects arise, the folios being kept in 1, 2, 3 order. They can be filed or found much quicker than by any other than arabic notation, which is the simplest known to the human mind. The numeric file scatters by accidental order matter on allied subjects which ought to stand side by side. Every system needs an alphabetic supplement for miscellaneous correspondents who write few letters, since it is self-indexed and its few papers are put away and found again quicker than if clast or numbered and indexed.

Classification.—A great file of papers is like a library in miniature. Experience the world over has proved that while alphabetic and numeric systems are invaluable for many purposes, usefulness demands close classing as material grows. The best plan is to combine simplicity of numeric and utility of clast as in the 'Decimal Classification and Relativ

Index' used by most libraries. The simplest possible printed index of 35,000 heads tells instantly by what number to mark or to find any paper. Bees are marked 638. This means class 6, Useful Arts, division 3, Agriculture, section 8, Bees. Every paper about bees is marked 638 and goes in the drawer in numeric order where it can instantly be found by the printed index. 43 years' use in 30 countries has proved this numeric system, with its relative index, a marvelous labor-saver. Classing is a necessity if all material on any given subject is to be readily found. The labor of making one's own classification is usually prohibitive if well done. By adopting the scheme in general use by libraries this labor is saved and subject numbers are in harmony with thousands of other catalogs and indexes in which each number has the same meaning; for as pointed out at a recent international congress, these numbers are an international language of perfectly definite meaning among all civilized nations, and also cheapest and quickest in application. Copies of this great labor saver can be found in any library.

Dead Matter.—Individuals like libraries may often wisely separate "dead" from "live" material. Correspondence and topics no longer often consulted are transferred to duplicate drawers of cheaper construction for storage. Working drawers and trays near the desk will thus be filled with matter oftenest used, while that removed is not tied in bundles or packed in boxes, but is kept best and cheapest in P and L drawers, in a single series, so that matter removed at different times is all found in its exact class, numeric or alphabetic order regardless of date of removal. The index entry shows by an underscore, topic removed to storage, so no time is lost in double reference.

This system has grown marvelously as people learned its economy of time and space. Formerly papers were folded, endorsed and tied in bundles. Flat filing in cabinets, minutely self-indexed without labeling, drove out that costly system. Vertical filing, like a library catalog, has now driven out most flat filing cabinets.

Loose Leaf System.—This started in Amherst College library in 1872 as a shelf list and is only a variation of the card index of which the essential is unlimited intercalation. Instead of standing on edge in drawers, loose leaves are put in a binder which holds them like a book, opening flat but allowing leaves to be added or removed at any point almost instantly. For certain desk uses this is preferable to trays, but most records go best in regular trays. Fear of losing detached pieces proves practically groundless and saving over books is very large. 9/10 of matter usually kept flat in drawers is better kept on edge in vertical files, handier and cheaper except for papers in constant use in open pigeonholes, cards in P trays and books and pamphlets on shelves.

Shelves.—The best library shelf is 75 cm long, 20 cm deep and 25.5 cm high, thus taking all books up to octavo, 25 cm. Book cases are 7 or 8 shelves high with 15 or 20 cm ledge, if wisht, above the 3 lower shelves. The best pamphlet case is a plain wood box covered with marble paper, open only on the back. This is handier and more durable than costly patent boxes. Read shelves, pigeonholes and

blanks all from top to bottom and from left to right like columns of a newspaper, never jumping the upright.

Colors.—These may have mnemonic values in binding, paper or ink. Languages, not subjects, should guide in bindings if books are arranged, as almost universally, by subjects, for variety of color on each shelf is important in finding and replacing books quickly. The library language scheme used for 40 years is:

- | | |
|-------------------------------|----------------------------------|
| 1. American, light brown | 6. Spanish, olive |
| 2. English, dark brown | 7. Latin, light green |
| 3. German, black | 8. Greek, dark green |
| 39. Minor Teutonic, dark blue | 91. Minor Aryan, light blue |
| 4. French, red | 92. Semitic, yellow |
| 5. Italian, maroon | 93-99. Hamitic, etc., light drab |

Colors beginning with the same letter as the subject are easier remembered, but should not be chosen if a distinctly better color is available. Libraries use blue for bibliography, canary for criticism, green (life color) for biography.

DAY COLORS.

Sunday	sage green	Thursday	turquoise
Monday	melon		or manila
Tuesday	terra-cotta	Friday	fawn
Wednesday	white	Saturday	straw

MONTH COLORS.

January	white	July	blue
February	fawn	August	apple green
March	melon	September	straw
April	azure	October	orange
May	manila	November	nile green
June	jonquil	December	dove or drab

PAPER COLORS FOR 26 LETTERS.

Omit most of those often confused or too dark to be written on. Avoid second colors named as they may confuse with others first in the list elsewhere. Letters with no available color are assigned the best unused, so to give colors for all 26 letters if needed.

A	azure, apple green, amber
B	blue, buff, brown
C	canary, cherry, carmin, cream, café-au-lait
D	dove, drab
E	ecru
F	fawn
G	green, gold, gray, granit
H	heliotrope, hazel
I	ivory, indigo
J	jacqueminot, jonquil
K	corn
L	lilac, lavender, lemon
M	melon, mauve, marigold, manila
N	nile green
O	orange, old gold, olive
P	pink, primrose, pearl gray, purple
Q	Quaker drab
R	red, rose, robin egg
S	sage, straw, salmon, sky blue, steel
T	terra-cotta, turquoise, tea, tan
U	ultramarine, buff
V	violet, mauve
W	white
X	granit
Y	yellow
Z	zenith (pale greenish blue), manila

The favorite distinct colors to write on are white, buff, blue, canary, green, cream, manila. Melon or salmon soils worst from handling. As cards must be of uniform size to fit trays and drawers, distinction of various circulars and blanks often made by shape is best made by color tho it may also be made by projecting tags, clipped corners or color of ink.

Ink Colors.—The best colors in order are: Black, red, blue, green; and less permanent, violet or lilac. Colors are used chiefly for figures or other short entries or for checking lists. 2, 3 or 4 pens or pencils can be carried between the fingers so that a check mark may be

made instantly in either of 4 colors. Red is used for receipts, returns, income, renewals; blue for the reverse, payments, outgo, issues; green for gain; lilac for loss. Special meanings are assigned to check marks for each case and are always written as a key at the beginning of the list for future reference. Inks or pencils of different colors assigned to different people working over the same lists show who made each mark. Where classification may change, color is better in ink than in paper as recopying can be saved by underscoring the first words in the new color.

Exact Reference.—In indexes and other exact work indicate by superior figures the particular ninth of page or column in which the passage referred to begins; 5:34⁹ means vol. 5, p. 34, beginning in third ninth of the page (about $\frac{1}{3}$ the way down). Of superior figures, odd numbers 1, 5 and 9 denote top, middle and bottom of pages; 3 and 7, points half way between top and middle or middle and bottom, while even numbers are mere modifiers of these positions, 2 denoting a point a little below the top, 8 a point a little above the bottom; 4 and 6, points just above and below middle. If there are several columns on a page, use 2 superior figures, the first denoting column and the second position in column; e.g., 7:89¹³⁻²⁸ means vol. 7, p. 89, beginning in the third ninth of column 1 and ending near the bottom (in the eighth ninth) of column 2.

L. B. Dates.—In condensed matter use the library date system (1) Day of week, (2) day of month, (3) month, (4) year:

Months				Days	
Ja	Ap	Jul	O	Su	Th
F	My	Ag	N	M	F
Mr	Je	S	D	Tu	St
				W	

For Wed. 9 Sept. 1885, write W9S85.

Numbers for months are dangerous. As usage is about equally divided, no one can tell whether 6-7 means July 6 or June 7. The L. B. dates above are exact, average fewer marks and are used for compactness and accuracy.

Colon Forenames.—Where space is important, indicate most common full names by initials followed by a colon or double period, thus C:H:Smith is Charles Henry Smith, while C. H. Smith may have any names beginning with C or H. With no extra space or cost full names are accurately given by this library list:

A: Augustus.	A. Anna.
B: Benjamin.	B. Beatrice.
C: Charles.	C. Charlotte.
D: David.	D. Delia.
E: Edward.	E. Elizabeth.
F: Frederick.	F. Fanny.
G: George.	G. Grace.
H: Henry.	H. Helen.
I: Isaac.	I. Isabella.
J: John.	J. Jane.
K: Karl.	K. Kate.
L: Lewis.	L. Louisa.
M: Mark.	M. Mary.
N: Nicholas.	N. Nancy.
O: Otto.	O. Olivia.
P: Peter.	P. Pauline.
R: Richard.	R. Rebecca.
S: Samuel.	S. Sarah.
T: Thomas.	T. Theresa.
U: Ulrich.	U. Ursula.
V: Victor.	V. Victoria.
W: William.	W. Wilhelmina.
	Z. Zenobia.

Roman numerals; write v. 88, not Vol. LXXXVIII. Never spell out numbers even at beginning of sentences. 88 is quicker written, quicker read, takes less space and is vastly better than "Eighty eight" with 11 letters to do badly what is done perfectly by only 2 figures.

Newspaper Clippings.—These are almost useless unless closely clast. Plain manila sheets 20 x 25 cm are better than patent scrapbooks. Clast like other papers with subject number on left upper corner and keep laced in binders or much better in L drawers like thin pamphlets, thus bringing clippings, circulars, letters and notes on each topic all together in one folio.

Metric System.—John Quincy Adams reported to Congress that metric weights and measures generally used would be a greater labor-saver to the human race than steam. Since then nearly all civilized nations have adopted them, and America and England are both nearing such adoption. The international decimal system, agreeing perfectly with our arithmetic, stands near the head as a labor-saver. Computation showed that a single railroad could save \$50,000 a year in clerical labor by its use. A committee of 20 normal school experts report that it would save a year in the school life of each child if we had only metric system (q.v.) instead of compound numbers.

Language.—The most practical, cheapest and oftenest needed labor-saver is to use the fewest words and marks that will convey meaning readily and accurately. See SIMPLIFIED SPELLING; SHORTHAND.

MELVIL DEWEY,
President National Efficiency Society; formerly
Director New York State Libraries.

OFFICIAL GROUP BALLOT. See
BALLOT.

OFFICIAL PLANTS (Lat. *officinalis*, of the shop, from Lat. *officina*, shop), plants which are used in medicine, and therefore sold in the druggists' and apothecaries' shops. The term "official" was formerly—though erroneously—used as a synonym of "official," meaning preparations recognized by the officials in charge of the compilation of pharmacopoeias. Many drugs and plants which are not official are sold in the shops, and are therefore official. (See PLANTS and related subjects). Consult 'United States Dispensatory' (19th ed., Philadelphia 1907).

OG, according to the Hebrew Scriptures, the king of Bashan, defeated by the children of Israel at Edrei (Num. xxi, 33). He is said by rabbinical writers to have been one of the giants who lived before the flood, and escaped the deluge by climbing to the roof of Noah's ark. Noah, according to tradition, fed the giants that they might be to men of after times a proof of the power of God, who had created and destroyed such monsters. In the war of Og against the Israelites he took up a mountain four miles in circumference to throw down upon Israel, when it was honeycombed by ants sent by Jehovah, fell and overwhelmed him. His teeth grew so quickly that they entered the mountain and held him fast, so that Moses could kill him. To give an idea of his gigantic size, the rabbins say that Moses, who according to their account was six ells high, and had a battle-ax of the same length, was obliged to make a leap of six ells in order to strike his ankle-bone. He bled to death of the wound.

Numbers.—Use only arabic numerals and letters and avoid the clumsy and easily misread

OGAM, ōg'ām, or **OGHAM**, an ancient alphabet or system of lettering, formerly in use among the Celtic peoples of Ireland, Scotland and Wales, chiefly found in inscriptions on stone, but also, though more rarely, in books.

• Ogam Inscription, From a Stone Found Near Ennis.

The ogams were supposed by the Irish to be the invention of the god Ogam. Ogams consist chiefly of straight lines, mostly vertical and oblique, horizontal lines and curves being sparingly used. They derive their significance partly from their position on a continuous horizontal stem-line along which they are written, some of the characters being drawn resting on the horizontal line as a base, others depending from it and others intersecting it. This horizontal line, however, really represents a perpendicular line, namely, that formed by the angle of the upright stone on which ogams were originally cut. The total number of letters represented in the alphabet is 21. According to some scholars a single vertical stroke resting on the line represents *h*; two contiguous strokes *d*; three *t*; four *c*; five *qu*. A single horizontal stroke depending from the line stands for *b*; two for *l*; three for *w* or *f*; four for *s*; five for *n*. The letters *m*, *g*, *ng*, *z* are represented by one to five oblique strokes right to left crossing the line; the vowels *a*, *o*, *u*, *e*, *i*, by one to five vertical strokes crossing the line. A cross on the line stands for *p* or *e*.

Diphthongs are represented by curves or compound letters.

The age of this alphabet has been the subject of considerable discussion. The best authorities seem now to be agreed that it cannot be traced beyond the introduction of Christianity.

Recent investigation tends to link the ogams with similar characters found in the Orient, and of relatively late date. The object of its construction seems not to be explained, but the most ancient ogams are all inscribed on stone. Ogams are found chiefly in Ireland, but some have been found also in Scotland, Wales, the Shetland Islands, and even in England, the total number known only amounting to about 300. The Celtic names which constitute the greater part of the inscriptions are frequently Latinized. There are numerous papers and discussions regarding them in the publications of archaeological societies.

Consult Abercromby, 'The Ogham Alphabet,' in the *Academy* (London 1880); 'd'Arbois de Jubainville, L'alphabet irlandais primitif et le dieu Ogmios,' in *Académie des inscriptions et des belles-lettres* (Paris 1881); Brash, R. R., 'The Ogam Inscribed Monuments of the Gael-hil in the British Islands' (London 1879); Loth, 'Le sort et l'écriture chez les anciens Celtes,' in the *Journal des savants* (Paris 1911); History, Grammar and Import of the Irish Epigraphy' (London 1897-1907); Mac Neill, 'Oghmoracht,' in the *Gaelic Journal* (Dublin 1908-09); id., 'Notes on the Distribution, History, Grammar and Import of the Irish

Ogham Inscriptions,' in the *Proceedings of the Royal Irish Academy* (Dublin 1909); Nicholson, W. B., 'Celtic Researches' (London 1904); Rhys, Sir John, 'Lectures on Welsh Philology' (2d ed., ib. 1879); id., 'The Inscriptions and Language of the Northern Picts,' in *Proceedings of the Society of Antiquarians of Scotland* (Edinburgh 1892); id., 'Celtic Britain' (3d ed., London 1904).

OGDEN, Aaron, American soldier: b. Elizabethtown, N. J., 3 Dec. 1756; d. Jersey City, 19 April 1839. He was graduated at Princeton College in 1773 and in 1777 he joined the army and served with distinction during the whole Revolutionary War, at one time under Lafayette, and obtaining the personal commendation of Washington. At the close of the war he was discharged with the rank of major. He afterward practised law, and was a Presidential elector in 1800. He was one of the commissioners for adjusting the disputed boundary between the States of New York and New Jersey; from 1801 to 1803 was United States senator, and in 1812 governor of New Jersey. He was president of the Society of the Cincinnati during the last decade of his career. Consult Dayton, A. O., 'Addresses before the Whig and Closophic Societies of the College of New Jersey' (Princeton 1839); 'Collections of the New Jersey Historical Society' (Vol. VII, Newark 1872).

OGDEN, Francis Barber, American inventor: b. Boonton, N. J., 3 March 1783; d. Bristol, England, 4 July 1857. He was aide-de-camp to General Jackson in the battle of New Orleans; is said to have been the first to apply the principles of the expansive power of steam and the use of right angular cranks in marine engines. In 1813 he obtained a patent for condensing engines of low pressure and with two cylinders, in which the above principles were utilized. In 1817 the first engine ever built on these lines was constructed by him in Leeds, England. The first screw propeller successfully introduced into practical use was launched by John Ericsson on the Thames, May 1837, and was called the *Francis B. Ogden*. The building of the first screw propeller for American waters, the iron vessel *Robert F. Stockton*, was superintended by Mr. Ogden in Liverpool, where he was United States consul (1829-40). From 1840-1857 he was consul at Bristol.

OGDEN, Frederick Nash, American military officer: b. Baton Rouge, La., 25 Jan. 1837; d. New Orleans, La., 25 May 1886. After engaging in mercantile life from boyhood he entered the Confederate army at the outbreak of the Civil War, and subsequently became major of heavy artillery and lieutenant-colonel of cavalry. At the close of the war he resumed commercial life, and in 1868 founded the Crescent City Democratic Club, a powerful political organization. He was made major-general of State militia; and was president of the Red Cross Association of Louisiana during the yellow fever epidemic of 1878.

OGDEN, Herbert Gouverneur, American cartographer: b. New York, 4 April 1846; d. 1907. He was educated in private schools; in 1863 was appointed an aid in the United States Coast and Geodetic Survey and an assistant in 1869. He served with the army on the defenses of Washington in 1864, accom-

panied the Nicaragua expedition in 1865, and the earliest naval exploring expedition to the Isthmus of Darien in 1870 as topographer, and had charge of the party sent to locate the international boundary between British Columbia and Alaska, in 1893. He was a recognized expert in topography and cartography.

OGDEN, Peter Skene, British-American fur-trader: b. Quebec, 1794; d. Oregon City, Ore., 27 Sept. 1854. His people had resided in New Jersey until the Revolution, when they removed to Canada, his father becoming a judge in the Admiralty Court at Quebec. He entered the service of the Hudson Bay Company in 1821 after several years' connection with the Northwest Company. His travels for the company extended through many practically unexplored portions of northwestern United States and southwestern Canada, particularly along the great rivers. He named Mount Shasta, and his explorations extended east into Nevada and Utah. The present Humboldt River, Nevada, was originally named for him, and in Utah there are Ogden City, Ogden Canyon, Ogden Hole, Ogden River and Ogden Valley. From 1845 until his death his headquarters were at Fort Vancouver, and after the retirement of Dr. John McLoughlin (q.v.) he became the ranking chief factor of the Columbia. He was said to be the best-known white man west of the Rocky Mountains among the Indians. He was a man of high courage and resourcefulness and was warmly regarded by both his men and the Indians. His rescue of the women and children captured by the Indians after the massacre at Whitman Mission in 1847, was among his last achievements, and the Indians themselves declared that they would not have surrendered the captives to another. He remained a British subject until his death. Author of 'Traits of American Indian Life' (London 1853), a rare and quaint little volume dedicated to Lady Simpson, wife of Sir George Simpson of the Hudson Bay Company. Consult Elliott, T. C., 'Peter Skene Ogden, Fur Trader' (1910); Laut, A. C., 'Conquest of the Great North-West' (1911).

OGDEN, Robert Curtis, American merchant and philanthropist: b. Philadelphia, Pa., 20 June 1836; d. 1913. From 1885 he was a retail merchant, a member of the John Wanamaker firm. He is best known by his work in behalf of the cause of education in the South. He was president of the board of trustees of Hampton Institute, a trustee of Tuskegee Institute and president of the Southern Educational Board and the Conference for Education in the South. His efforts were directed chiefly toward providing education for both negroes and illiterate whites through Southern agencies and in friendly co-operation between Northerners and Southerners. In 1903 Tulane University gave him the degree of LL.D. in recognition of his services, and Union College and Yale University accorded him like recognition. He published 'Samuel Chapman Armstrong,' the Founder's Day address at Hampton Institute (1894); 'Pew Rents and the New Testament' (1892); 'Sunday School Teaching' (1894).

OGDEN, Rollo, American clergyman and newspaper editor: b. Sand Lake, N. Y., 19 Jan. 1856. He was educated at Williams College,

Andover Theological Seminary and the Union Theological Seminary and was ordained in the Presbyterian ministry in 1881. He was associate pastor at First Church, Cleveland, Ohio, in 1880-81; was a missionary in the City of Mexico in 1881-83 and in 1883-87 he was pastor of Case Avenue Church, Cleveland. In 1887 he engaged in literary work in New York. He joined the staff of the New York *Evening Post* in 1891, and since 1 Feb. 1903 he has been editor of that publication.

OGDEN, Ruth, the pen name of Fannie Ogden Ide, an American writer of juvenile stories: See IDE, FANNIE OGDEN.

OGDEN, William Butler, American railroad president: b. Walton, N. Y., 15 June 1805; d. New York, 3 Aug. 1877. He entered upon a business career at an early age, was a member of the New York State legislature in 1834, and in 1835 he removed to Chicago where he established a real estate business. Upon Chicago's incorporation as a city in 1837 he became its first mayor, and he was closely identified with the early development of the city. He was an active promoter of the Chicago and Galena Railroad, of which he became president in 1847. He was deeply interested in canal improvements and advocated the construction of a ship canal across the Michigan Peninsula. He became president of the Chicago, Saint Paul and Fond du Lac Railroad in 1855, and was instrumental in merging it in 1864 with the Chicago and Galena and other smaller railroads into the Chicago and Northwestern Railroad, of which also he was president. He was the first president of the Union Pacific Railroad and a believer in the expansion of railroad service to the Pacific. He was largely interested in the lumber trade and connected with many hospitals, educational and charitable institutions as an officer and benefactor.

OGDEN, Utah, city, county-seat of Weber County, at the junction of the Ogden and Weber rivers, and on the Southern Pacific, Union Pacific, Rio Grande Western, Oregon Short Line and Salt Lake and Ogden railroads, about 35 miles north of Salt Lake City and 10 miles from Salt Lake. It was founded in 1848, and in 1850, under the direction of Brigham Young (q.v.), it was laid out as a city. In 1851 it received its charter. Ogden is in a fertile agricultural region, and in the vicinity of valuable mines. The opening of the Ogden Cañon is at the city limits, and its grand and picturesque scenery brings many tourists to the place. The water power of the falls is used for the electrical works which supply power, light and heat for Ogden and Salt Lake City. The chief industrial establishments are canneries, pickle factories, beet-sugar factory, woolen mills, cement mills, can factories, cereal establishments, broom factory and brick and tile yards. It has an extensive trade in manufactures and farm products, and is the distributing centre of quite a region with which it is connected by railroads. The educational institutions are the State Industrial School, State Institutions for the Deaf, Dumb and Blind, the Weber State Academy (Mormon), the Sacred Heart Academy (Roman Catholic) and public and parish schools. The government which is vested in a mayor, who

holds office two years, and a council is of the commission form, which replaced that of 1898. The mayor appoints, subject to approval by the council, the administrative officials except the treasurer, clerk, auditor, police justice and attorney, who are elected by the people. Pop. (1920) 32,804.

OGDENSBURG, N. Y., city, port of entry, in Saint Lawrence County, at the confluence of the Saint Lawrence and Oswegatchie rivers, and on the New York Central and Hudson River and the Rutland railroads, about 170 miles, in direct line, northwest of Albany, the State capital. It is connected by ferry with Prescott, Ontario. It is at the foot of the deep-water navigation of the Great Lakes, has unusual facilities for transportation, has direct connection by rail with New York City and Boston, and steamer connection with all the lake and river ports. Shipping and wholesale dealing in lumber, grain and coal are its most prominent industries. Several fleets of vessels are owned here. Other important industries are the manufacturing of silk, flour, gloves, dress skirts, leather and brass goods, lumber and lumber products. The importations at the port of entry amount to about \$22,000,000; exportations, about \$7,000,000. The prominent public buildings are the custom-house, a fine town-hall, an opera-house, two handsome club-houses, a state armory and seven large churches, including the Roman Catholic cathedral. Among the charitable institutions the most prominent is the Saint Lawrence State Hospital for the Insane, established and equipped at a cost of several millions, and supervised and superintended by specialists. Other institutions are the City Hospital, United Helpers' Home, Saint John de Deo's Hospital (quarantine hospital), an orphanage and a home for the aged. The educational institutions are Saint Mary's Academy (free), public school free academy, public and parish schools and a public library. The library is built on a site of great beauty on the river front and surrounded by several acres of green lawn and trees. The building cost \$50,000 and was paid for by the citizens of the city. By an act of the legislature in 1901 the corporate limits of the city were extended. Pop. (1920) 14,609.

OGÉ, Jacques Vincent, zhăk vãn-sôn ô-zhă, Haitian revolutionist: b. Donon, Haiti, about 1755; d. Haiti 1791. He was a mulatto, but was born free and as a young man served in a German army there. In 1789 he represented Haiti in the Constitutional Assembly and when he returned to Haiti he took up the cause of the slaves. Unsuccessful in his petitions to the assembly, he formed a company in the United States in 1790 and led a revolt in 1791. He was victorious in several battles, but was ultimately defeated; the plea that his life should not be forfeited if he surrendered was disregarded and he was tried and sentenced to death and executed.

OGEE, ô-jē', in architecture, a molding consisting of two members, one concave and the other convex. An ogee arch is a pointed arch, the sides of which are each formed with a double curve. It is generally introduced over doors, niches, tombs and windows, its inflected curves weakening it too much to permit of its application for the support of a great weight.

OGEECHEE, ô-g'é-chē, a river in Georgia, has its headwaters in Greene County, flows southeast into Ossabaw Sound, a course of about 200 miles. Savannah is 17 miles north of the mouth of the river. Where the waters enter the sound a number of islands have been formed, largest of which is Ossabaw. The river is navigable for small steamers for some distance from the ocean.

OGGIONE, öd-jō'nē, or **OGGIONO**, Marco da, Italian painter: b. Oggiono, Lombardy, about 1470; d. between 1530 and 1540. He studied religious painting under Leonardo da Vinci as early as 1490 and was the oldest of that master's scholars. One of the finest of his pictures is 'The Three Archangels' in the Brera at Milan. He is, however, best known for his copies of 'The Last Supper' of Leonardo, one of which is in Burlington House, London; another in Santa Maria della Grazie, Milan, and a third at Louvre. The pretty picture at Hampton Court of 'The Infant Christ and Saint John Kissing,' generally attributed to Leonardo, is undoubtedly the work of Oggione whose creations are not unfrequently credited to his greater teacher. A 'Salvator Mundi,' in the Detroit Museum, is said to be the work of Oggione.

OGILBY, ô'g'l-bī, John, British writer: b. in or near Edinburgh, November 1600; d. London, 4 Sept. 1676. His father was of a good family but lost his fortune and became a prisoner in the King's Bench; but young Ogilby hoarded small savings, adventured in the Virginia lottery and won sufficient money to free his father and start himself in life. He was tutor to the children of the Earl of Stafford, lord deputy of Ireland, and afterward he owned a prosperous little theatre in Saint Werburgh street, Dublin. The misfortunes of the Civil War ruined him and he made his way to Cambridge, where he gained the interest of scholars there and taught Latin. He translated Virgil and received a considerable sum for it, and later realized a further sum by a translation of Æsop. He then learned Greek and made translations of the 'Iliad' and 'Odyssey' of Homer, in which he is supposed to have been assisted by Shirley. After the Restoration he gained the favor of Charles II, established another theatre in Dublin and later removed to London where he set up a publishing business. His plant was destroyed in the great fire of 1666, but he was enabled to rebuild his establishment and was known for the fine work produced. Many of the books were in folio form with engravings by Hollar and others of note. He produced sumptuous editions of his own translations from the classics, and later issued many profusely illustrated volumes on geography and typography. His translations and his verse were ridiculed by Dryden and Pope, but Pope is credited with borrowing from the despised translations of Virgil.

OGILVIE, ô'g'l-vī, Clinton, American painter: b. New York, 28 Dec. 1838; d. 1900. After studying under James McDougal Hart (q.v.), he started on his student-travels in Europe and spent much time in the art galleries and studios of Paris (1866-67, 1872-73). In 1864 he was elected an associate of the National Academy. He has been successful as a landscape painter and has generally gone to

Switzerland or France for his subjects. His best-known pictures includes 'The Valley of Schwytz, Switzerland'; 'Lake Como near Bellagio'; 'Among the Adirondacks'; 'At Eaux Bonnes, France'; 'Argelès'; and 'Saint Barthelemy, near Nice.'

OGILVIE, William Henry, Australian poet and journalist: b. Holefield, Scotland, 21 Aug. 1869. He went to Australia at the age of 20, where he was soon in the bush, breaking horses and driving, at which he spent 11 years, also sampling sheep and experiencing station life in all its phases. He finally became overseer of the station. While there he wrote verses for the *Sidney Bulletin*. In 1905-07 he was professor of agricultural journalism in Iowa State College in the United States. Among his published works are 'Fair Girls and Gray Horses' (1891); 'Hearts of Gold' (1901); 'My Life in the Open' (1908); 'Whaup o' the Rede' (1909); 'The Land we Love' (1910); 'The Overland and Other Verses' (1913); 'The Honor of the Station' (1914).

OGILVIE-GORDON, Mrs. Maria M., Scottish geologist: b. Aberdeen, 19th century. She was educated at Ladies' College, Edinburgh, University College, London, London University and at the University of Munich. She was the first woman to be awarded a Ph.D. at the University of Munich. She has specialized in observations of the volcanic and dynamic phenomena of the dolomites, South Tyrol, and disproved the applicability of Darwin's coral-reef theory to the dolomite reefs in this area. She has also made investigations of the microscopical structure of the skeletons of both fossil and recent corals. Author of 'The Wengen and Cassian Strata in South Tyrol' (1893); 'Coral in the Dolomites' (1894); 'Microscopic and Systematic Study of the Madreporian Types of Corals' (1895-96); 'The Torsion Structure of the Dolomites' (1898-99); 'The Geological Structure of Monzom and Fassa' (1902-03); 'Overthrust Structure in the Langkofl' (1907); 'The Thrust-masses in the Western Districts of the Dolomites' (1910).

OGLESBY, ō'glz-bī, Richard James, American soldier and lawyer: b. Oldham County, Ky., 25 July 1824; d. Elkhart, Ill., 24 April 1899. He removed with an uncle to Decatur, Ill., in 1836, studied law there while engaged in the carpenter's trade and gained admission to the bar in 1845. He served in the Mexican War with the rank of lieutenant and later entered the Louisville Law School, where he was graduated in 1848. In 1851 he resumed his law practice in Decatur, Ill., and in 1860 was elected to the State senate from which he resigned to enter the Union army. At Forts Donelson and Henry he performed distinguished service and in 1862 was promoted brigadier and later major-general of volunteers. He was at the battles of Pittsburgh Landing and Corinth and was compelled to resign in 1864 because of his wounds. In 1865-69 he was governor of Illinois and in 1872 was re-elected but declined the office to become United States senator in 1873-79. He was again governor in 1885-89.

OGLETHORPE, ō'gl-thôrpe, James Edward, English soldier and colonist: b. London, 21 Dec. 1696; d. Cranham Hall, Essex, 1 July

1785. In 1714 he joined the army of Prince Eugène as aide-de-camp, whom he served with distinction in the campaign against the Turks, 1716-17, especially at the siege and capture of Belgrade (q.v.). In 1722 he was sent to Parliament as member for Haslemere. Becoming acquainted with the abuses of the debtor's prison in London, he made them known to Parliament and was appointed chairman of a committee for their investigation. His work in behalf of insolvent debtors, thus begun, was continued in his project for their colonization in North America, in connection with which he also aimed at an asylum for oppressed Protestants of the European continent. With others in 1732, he obtained a charter for a tract of land between the Altamaha and Savannah rivers and in January 1732 Oglethorpe with a party of 120 colonists arrived at Charleston. Soon afterward he founded Savannah (q.v.) and for 10 years he served as governor of the colony of Georgia, named in honor of George II. By his defense of the colony and neighboring territory of the South against encroachments of the Spaniards and Indians from Florida and his efforts to secure the trade of the Cherokees, he rendered services to England quite beyond the ordinary work of colonial administration and laid for Georgia the foundation of a stable commonwealth. Besides the defenses which he gathered in the colony, in 1738 he brought a regiment of volunteers from England, and in the war of Jenkins' Ear (see COLONIAL WARS IN AMERICA), he vigorously laid siege to Saint Augustine, with 2,000 men, but the inadequacy of his force prevented him from capturing the place. He achieved an important success in holding Amelia Island against the Spanish attack, and another by his victory at Frederica, in 1742. In 1743 Oglethorpe returned to England, and two years later was made major-general. He had brought himself into financial straits by advancing money for defensive needs in Georgia. In 1745 he served against the Stuart invaders, and pursued the Jacobite fugitives. He was court-martialed for failing to overtake them, but honorably acquitted. Oglethorpe and his fellow-trustees of Georgia surrendered their charter in 1752, and the colony became a royal province. In 1765 he was raised to the rank of general in command of all the king's forces. His interest in American affairs never abated, and he was one of the first to wait upon Mr. Adams, after his arrival in England as Ambassador, to whom he expressed his esteem and regard for America, and his satisfaction at the termination of the difficulties between Great Britain and her colonies. Consult Bruce, Henry, 'Life of General Oglethorpe' (New York 1890); Cooper, H. C., 'James Oglethorpe, the Founder of Georgia' (New York 1904); 'Journal of the Earl of Egmont' (Atlanta 1908); Sparks, 'American Biography,' 2d series, Vol. II, for a memoir of Oglethorpe by W. B. O. Peabody; Wright, 'Memoirs of James Oglethorpe' (1867); and Lecky, 'England in the 18th Century' (Vol. I, 1879).

OGLETHORPE UNIVERSITY, Atlanta, Ga., a coeducational institution established under the auspices of the Southern Presbyterian Church, with a Presbyterian directorate. It is a successor of the former Oglethorpe University which was established in 1835 and had a suc-

cessful existence until the disturbances of the Civil War interrupted its operation and resulted in its closing in 1872.

OGMORE AND GARW, ōg'mōr and gār'oo, Wales, town in Glamorganshire, near Bridgend. There are the Norman ruins of Ogmores Castle, and those of the fortified priory of Ewenny, dating from 1146. The town is situated in an important coal-mining district. Pop: 26,741.

O'GORMAN, James Aloysius, American jurist and politician: b. New York, 5 May 1860. He was educated at the College of the City of New York and at New York University, and was admitted to the bar in 1882. He was justice of the District Court of New York in 1893-1900, and of the Supreme Court of New York in 1900-11. He served in the United States Senate in 1911-17, and in 1912 was a member of the executive committee of the Democratic National Committee. He resumed his law practice in New York in 1917.

O'GORMAN, Thomas, American Roman Catholic prelate: b. Boston, Mass., 1 May 1843; d. Sioux Falls, S. Dak., 18 Sept. 1921. His early education was obtained in Chicago and Saint Paul, and from his 10th to his 22d year he studied in France. From 1867-78 he was pastor at Rochester, Minn., from 1878-82 a member of the Paulist community, New York City, and from 1882-85 pastor at Faribault, Minn. Chosen first president of Saint Thomas' College, Merriam Park, Saint Paul, he was for four years its professor of dogmatic theology, and in 1890 was called to the chair of Modern Church History in the Catholic University, Washington, D. C. On 19 April 1896 he was consecrated bishop of Sioux Falls by Cardinal Satolli in Washington. Bishop O'Gorman was an authority on mooted historical questions and the author of a 'History of the Roman Catholic Church in the United States.' When, in 1902, President Roosevelt sent a commission to Rome to treat with the Vatican on Philippine matters, Bishop O'Gorman was chosen a commissioner.

OGOWAI, ō-gō-wā', or **OGOVE**, ō-gō-vā', the principal river of the French Congo, equatorial West Africa. It has a densely forested and wide delta on the western coast near Cape Lopez. Its sources are in the Cristal Range, about 130 miles west of Stanley Pool, and it reaches the Atlantic after a northwesterly, circuitous course of about 700 miles, 200 miles of which from the mouth are navigable by small steamers. It has several tributaries, the chief of which are the Ivindo and the Lolo. The river was discovered by Du Chaillu in 1857 and explored by him (1857-59). It flows through a densely populated country; and along its banks are a number of European posts and trading stations.

O'GRADY, Standish, Irish author: b. Castletown Berehaven, County Cork, 18 Sept. 1846. He was educated at Trinity College, Dublin, was called to the bar and later abandoned law for literature. He has devoted himself chiefly to the romances and history of Ireland, and is generally credited with the initiation of the movement known as the Celtic Renaissance. He is editor of *Pacata Hibernia*, and author of 'History of Ireland, Heroic Period'; 'History of Ireland, Critical and Philosophical Period';

'The Flight of the Eagle'; 'The Bog of Stars'; 'Finn and His Companions'; 'Lost on Du-Corrig'; 'The Coming of Cuculain,' etc.

O'GROWNEY, Eugene, Irish Gaelic scholar: b. Ballyfallon, County Meath, 25 Aug. 1863; d. Los Angeles, Cal., 19 Oct. 1899. He was educated at the Diocesan Seminary at Navan, and at Maynooth College, and was ordained in the Roman Catholic Church, 24 June 1889. He was appointed curate at Ballynacargy, County Westmeath, immediately after his ordination and remained there until 1891, when he became editor of the *Gaelic Journal* and was appointed professor of Irish at Maynooth College. He had from his student days taken a keen interest in the Irish language and spent many of his holidays in the Isles of Aran and in the sections of Connemara and Cork where the language remains pure. Under the strain of his many duties at the college, together with the editing of the *Gaelic Journal* and attending to its wide correspondence, Fathér O'Growney's health began to fail. He nevertheless succeeded in preparing a summary of Irish grammar, two parts of a series of Irish readers, and one part of a manual on Irish composition. He is credited with being one of the leaders of the Irish language awakening; was actively connected with the establishment of the Gaelic League in 1893, and that year inaugurated the 'Easy Lesson in Irish,' which appeared in *Freemans' Journal* and in the *Gaelic Journal*; and afterwards were published in book form as 'Simple Lessons in Irish,' forming an important contribution to the Irish language movement. In 1894 he was granted leave of absence and went to Arizona for his health. He failed steadily, however, and died at Los Angeles in 1899. Four years later his body was taken to Ireland for interment. Consult O'Farrelly, Agnes, 'Leabhar an Athar Eoghan, the O'Growney Memorial Volume' (Dublin 1904).

OGSTON, ōg'stōn, Sir Alexander, British surgeon: b. Edinburgh, 1844. He was educated at Aberdeen University, was assistant professor in forensic medicine there in 1866-73, lecturer in surgery in 1874-82, professor of surgery in 1882-1910, and since then professor emeritus. He is famous for operations correcting knock-knee and flat foot and for frontal sinus disease. He was with the British army in the Sudan in 1885, and again in the South African War in 1899-1900, receiving rank as honorary colonel in the Royal Army Medical Corps. He was honorary surgeon in Scotland for Queen Victoria and King Edward VII, and is surgeon in ordinary for King George V in Scotland. He was knighted in 1912 and in 1914-15 he was president of the British Medical Association. In the European War he served in Serbia in 1915 and in Italy in 1916-17. Author of 'Contributions to Medical Science' (1869); 'Surgical Papers' (1871); 'The Peace Conference and the Dum Dum Bullet' (1899).

O'HARA, ō-hār'a, John Bernard, Australian poet: b. Bendigo, Victoria, 29 Oct. 1864. He was graduated from Melbourne University in 1885 and four years later he became principal of Melbourne College, a position he has retained ever since. He is the author of 'Songs of the South' (1891-95); 'Lyrics of Nature'

(1899); 'Sonnets' (1902); 'Odes and Lyrics' (1906).

O'HARA, Theodore, American soldier and poet: b. Danville, Ky., 11 Feb. 1820; d. near Guerryton, Barbour County, Ala., 6 June 1867. He studied law and was admitted to the bar; but quitted it to become an officer in the United States navy. He was connected with the Lopez and Walker movements, and served as captain and major in the Mexican War. In the Civil War he was a colonel in the Confederate service. His famous poem, 'The Bivouac of the Dead,' was written in commemoration of the Kentuckians killed in the battle of Buena Vista during the War with Mexico. Consult Rauck, G. W., 'O'Hara and his Elegies' (Baltimore 1875).

O'HIGGINS, ò hig'inz (Sp. ò-é'gēns), **Ambrosio**, South American administrator: b. County Meath, Ireland, about 1730; d. Lima, Peru, 18 March 1801. His real name was Ambrose Higgins. His uncle, who was a Spanish priest, had charge of his education and sent him to South America. He went to Buenos Ayres first and then to Chile, where he was a trader and peddler for several years. He entered the Spanish army, distinguished himself in the Araucanian wars, where he had command of the frontier against the Indians, with the title of intendant. He rapidly rose in rank until in 1788 he was made captain-general of Chile. His rule there proving very successful, he was given the title of Marquis of Orsino and appointed viceroy of Peru in 1796, where he also proved an excellent ruler and retained this latter office until his death. His son Bernardo O'Higgins (q.v.) also played an important rôle in Chilean history.

O'HIGGINS, Bernardo, Chilean soldier and dictator: b. Chillan, Chile, 20 Aug. 1776; d. Lima, 24 Oct. 1842. A natural son of Ambrosio O'Higgins (q.v.), he was educated in England, where he became a republican under the influence of Miranda and others. He returned to Chile in 1802, and in 1810 joined the Chilean revolutionists. In 1813, when Carrera was deposed from the supreme command of the army, O'Higgins was appointed to succeed him. He met with constant opposition from Carrera and his faction and civil war was imminent, when a Spanish army from Peru entered the country and the two factions combined to withstand the Spanish attack. The Chileans under the command of O'Higgins met the Spaniards at Rancagua, 2 Oct. 1814 and were defeated on account of Carrera's failure to bring the reinforcements expected. The leaders fled across the Andes, but O'Higgins, in 1817, joined the invasion under San Martín as one of the chief lieutenants. The charge under his leadership decided the Chilean victory at Chacabuco, 12 Feb. 1817. He was then made dictator of Chile, after San Martín had declined the office. Under his rule the independence of Chile was formally declared and the Spaniards driven out. His administration was efficient but his republican sentiments and his attempts to establish a representative constitutional government aroused the opposition of the aristocratic party, which, aided by the adherents of Carrera, rebelled and finally deposed him in 1823; he then went to Lima, Peru, where he spent the rest of his life. Consult Chisholm, A. S., 'The Inde-

pendence of Chile' (Boston 1911); Vicuña-Mackenna, 'Vida de Don Bernardo O'Higgins' (Santiago 1882).

O'HIGGINS, Chile, an inland province bounded north and west by Santiago, by Argentina on the east and by Colchagua on the south. Area, 2,342 square miles. Capital, Rancagua (q.v.). The surface in the west is level and is devoted to agriculture and pasturage; in the east the country is on the slope of the Andes and in this mountainous region gold and other metals are mined. The principal rivers are the Maipo and the Raipe. Pop. about 100,000.

OHIO (Iroquois, *Ohionhiio*, "beautiful river." Popular name, **BUCKEYE STATE**), a State in the north central part of the United States; bounded on the north by Michigan and Lake Erie, on the east by Pennsylvania and West Virginia, on the south by West Virginia and Kentucky, on the west by Indiana. The boundary lines dividing Michigan and Indiana from Ohio, and Pennsylvania from Ohio to the Ohio River, are straight lines, the southern and southeastern boundaries are formed by the Ohio River. The State is between lat. 38° 27' and 41° 57' N. and long. 80° 34' and 84° 49' W. The maximum length, north and south, is 210 miles and east and west 215 miles. The area is 41,060 square miles, of which 300 square miles are water surface. In size it ranks 32d among the States and was the fourth State admitted into the Union.

Topography.—That portion of the State bordered by the Ohio River and Lake Erie has an irregular boundary. The course of the Ohio along the border is 436 miles; the lake shore is 230 miles, giving the State a navigable water front of 666 miles. The largest inlets from Lake Erie are Sandusky and Maumee bays. In the portion of the lake between those bays are a number of islands, several of which belong to Ohio. The general surface of the State is a rolling plain, from 300 to 500 feet above Lake Erie, or from 900 to 1,200 feet above the sea. Some portions have an altitude of 1,500 feet; in Logan County, the western part of the State, is the highest point, 1,540 feet altitude, and the lowest is the shore of the Ohio near Cincinnati. The divide between the rivers of Lake Erie and those of the Ohio River is a low ridge which crosses the State from the middle of the western border, in Mercer and Darke counties, to near the northeastern boundary, in Trumbull County. The river channels are cut deep in many parts of the State and many of the banks are massive rugged rocks and huge boulders. The best harbors on the lake shore are Ash-tabula, Cleveland, Sandusky and Toledo.

Hydrography.—There are two drainage basins in the State; the one sloping north toward Lake Erie, and the other south toward the Ohio. The rivers flow through valleys, some of which were at one time flood plains, but many of the streams have cut channels from 100 to 200 feet in depth and flow through low valleys. The Ohio River is in some places from 500 to 600 feet below the hills on either side and a considerable distance below the tops of the banks. The streams which flow south are the longest and deepest. The largest are the Muskingum, Mahoning, Hocking, Scioto, Little Miami and Great Miami. The longest wholly within the State is the Muskingum.

This river has been made navigable by slack-water and other improvements for about 100 miles from its mouth. The chief rivers in the northern basin are the Maumee, Portage, Sandusky, Huron, Vermilion, Black, Rocky, Cuyahoga and Chagrin. Many of the rivers of the State furnish considerable water power and are a great aid in the development of manufacturing industries. There are no large lakes in the State, but in many parts there are groups of small lakes noted for their beauty. In Summit County there are several small lakes. The buried river channels which are found in many places in Ohio are of interest to the geologist. These channels have been filled in by sand, gravel, etc., and now the waters of rivers that once followed deeply excavated channels are flowing over beds far above their former bottoms.

Geology.—There are no great breaks of the strata, nor any great variations in the geological structure of the whole State; the underlying sedimentary rocks show only a slight inclination from the horizontal. There is a broad fold whose axis extends from the northeastern part of Indiana southeast to near Cincinnati, then crosses into Kentucky, extending to about the central part. This is called the Cincinnati Arch or anticlinal. From this arch the strata dip westward to the coal fields of Illinois and south and southeast under the Alleghany coal fields. The elevation of this arch must have occurred at the close of the Lower Silurian period and prior to the beginning of the Upper Silurian period. The geological formations which are exposed are the Lower and Upper Silurian, the Devonian, the Carboniferous and the drift. In the Lower Silurian near Cincinnati may be found the oldest rocks, called the Cincinnati Group. In but few localities is there found such a variety and richness of the fossil remains as in the beds of limestone and clay or marl in this vicinity. On the crown of the Cincinnati Arch, near the northern part, the formations of the Upper Silurian area may be seen. Near Sandusky is the Salina group, the formation containing salt as at Syracuse, N. Y. Here also are beds of gypsum. In the western part and on the islands of Lake Erie is the water lime which is found in the Helderberg region of New York State. It flanks the Cincinnati Arch on each side. The corniferous limestone, the chief element of the Devonian in the State, forms two outcropping belts on opposite sides of the Cincinnati Arch, one crossing the northwest corner of the State and the other extending from Sandusky to Columbus. Corniferous limestone forms the surface rock of Kelley's Island. This same rock is quarried at Kelley's Island, Sandusky, Columbus and other places in the State. The capitol at Columbus is built of this stone. In the corniferous rocks at Sandusky and Delaware are found the remains of fossil fish. The black shale, similar to that found in the Genesee Valley in New York State, is in the northwest corner of the State, and also a belt from 10 to 20 miles wide, extends from the mouth of the Huron River to the Ohio. It is a black bituminous shale containing from 10 to 20 per cent of carbonaceous matter. It is the source of a large part of the oil and gas of Ohio. In this shale are found the remains of large fossil fishes. Bordering on the lake shore from the Pennsylvania line is

a mass of shale, the upper member of the Devonian, and the continuation of the formations found in the Portage and the Chemung Valley of western New York. The eastern part of the State is underlain by the Carboniferous formation, an extension of the great Alleghany coal fields. The coal measures are composed of strata of shale, sandstone, coal, limestone and fire clay with iron ores are found in the eastern and southeastern part. These coal measures have an area of 10,000 square miles in Ohio. There are no formations later than the Carboniferous until the period of the Glacial drift. All the State except the southeastern portion was covered with ice. The drift deposit in many places is several hundred feet deep. The Great Lakes once overflowed much of the State, as may be traced by the existing raised beaches.

Minerals and Mining.—According to the Fourteenth Census of the United States, Ohio which ranks thirty-fifth among the States in size and fourth in population, ranked seventh in the value of mineral products in 1919. The State ranked fourth in the total number of persons engaged in the mining industries and in the average number of wage-earners employed. The gross value of the mineral products of the State that year was \$134,518,505. The net value, after deducting \$3,092,567 (the value of natural gas sold by some producers for use as materials and by others for resale) was \$131,425,938, an increase of 125.1 per cent as compared with the value of the mineral products reported at the census of 1909. The Fourteenth Census report states that whereas this increase was perhaps largely due to general price increases, it was also due in part to growth of the mining industries. The industries reported for 1919, ranked according to value of products, were coal mining, petroleum and natural-gas production, limestone quarrying, sandstone quarrying, clay mining and gypsum mining. The production of salt was an important mineral industry in Ohio in 1919 but, for reasons not stated, was not included in the census of mines and quarries. Four industries—coal, petroleum and natural gas, limestone and sandstone, together reported 98.9 per cent of the total value of products and 98.8 per cent of the total number of wage earners employed in mining and quarrying in Ohio in the year under review. The principal mining industry, coal, reported products valued at \$77,988,602, or 58 per cent of the total value of the products of all mining industries. Ohio ranked fourth among the coal-producing States. The coal producing area of this State is part of the Northern Appalachian Coal Province, which extends into adjoining States. In Ohio it covers approximately 12,500 square miles in eastern and southeastern counties, 28 of which reported production in the year referred to. The petroleum and natural gas industry ranked second with an output valued at \$42,390,958, net, Ohio being seventh among the States in the production of these commodities. The petroleum and natural gas operations were in two fields—the Appalachian field in the eastern half of the State, from which 36 counties reported production; and the Lima-Indiana field in Northwestern Ohio, wherein 14 counties reported production. In 1919 limestone held third rank among the mineral industries of the State and sandstone fourth. In both of these industries Ohio ranked

second among the States of the Union with products valued at \$6,742,496 and \$2,759,352 respectively. The limestone operations were well distributed over the State and were reported from 32 counties; sandstone quarrying was reported from only 12 counties in the eastern half of the State.

The number of mining enterprises in the State was 2,283, capitalized at \$256,057,996 and employing 49,298 wage-earners whose wages totaled \$58,109,904. These figures compare with 1,876 enterprises, capitalized at \$161,324,529, and employing 50,567 wage-earners whose wages totaled \$26,769,229 in 1909. Production of the principal minerals in 1921 was as follows: cement, 2,518,723 barrels; clay products (value \$67,396,680); coal, 31,942,776 short tons; pig iron, 3,649,835 long tons; natural gas, 47,412,000,000 cubic feet (value \$19,216,000); petroleum, 7,335,000 barrels; salt, 749,349 short tons; sand and gravel, 5,138,276 short tons; stone, 7,229,150 short tons. The total value of the 1921 output was \$223,533,658 as against \$355,844,499 in 1920. In 1922 Ohio produced 26,500,000 tons of coal and 6,762,000 barrels of petroleum.

Climate.—The climate while temperate is variable, and great extremes occur; but neither excessive heat nor cold is of long duration. The maximum temperature is 107.9° and the minimum 34° below zero. The northern part of the State has a longer and colder winter than the southern part; but the winters are not severe in any part of the State. In the northern part, near the lake, sudden changes of temperature occur, especially during the summer season. The mean temperature for July is 73°, for January 26°. The rainfall is evenly distributed and of an amount generally conducive to the growth of farm products. The annual rainfall averages 39.35 inches. The climate is healthful; the winds which are at times a disturbing element as regards temperature, serve to keep the climate of the State as a whole remarkably healthful.

Soil.—The soil of nearly two-thirds of the State is the deposit of the drift or quarternary, and nearly all of such soil is fertile. In the southeastern part the soil is composed of the decomposed sub-rock structure. In the northeast the clay soils are found in many counties and in the west there is a large percentage of limestone; along the rivers are alluvial soils.

Forests and Forest Products.—The western part of the State was once covered with forests, the hardwood variety of timber used in building, was abundant. The ash, elm, beech and varieties of cedar, pine, chestnut, maple, oak and in some parts walnut were found. In the western part the prairie zone begins. The total extent of forests is about 9,300 square miles, which is 23 per cent of the total area. The wood products of Ohio were noted for their good quality, when the raw material was obtained from the forests of the State. There are over 1,000 lumber and timber manufacturing, and the value of the product for a single year is over \$54,144,000. The value of the lumber and planing mill products, including sash, doors and blinds, in a recent year was \$32,428,000, the value of the furniture products is over \$35,224,000, and of paper and wood pulp, over \$55,000,000. The flora and fauna of Ohio belong to the temperate zone, but all large wild

animals have disappeared before the advance of civilization.

Agriculture.—The agricultural statistics of Ohio, taken from the 14th report of the United States Census Bureau, show that in 1920 there were 256,695 farms, totaling 23,515,888 acres, in the State. Improved land in farms totaled 18,542,353 acres; woodland, 3,198,929 acres; other unimproved land, 1,774,606 acres. The percentage of land area in farms was 90.2 and the percentage of farm land improved was 78.9. The value of all farm property was \$3,095,666,336, compared with \$1,902,694,589 in 1909. Land and buildings in 1920 were valued at \$2,661,435,949 (land alone at \$2,015,112,999); implements and machinery at \$146,575,269; live stock at \$287,655,118. The average value per farm, all farm property, was \$12,060; land and buildings, \$10,368; land alone, \$7,850. The average value per acre of land in farms was: All farm property, \$131.64; land alone, \$85.69. There were in the State 31,479 farms of less than 20 acres each; 44,535 of between 20 and 49 acres; 86,337 of between 50 and 99 acres; 69,738 of between 100 and 174 acres; 37,546 of between 175 and 499 acres; 728 of between 500 and 1,000 acres and 105 of 1,000 acres and over. Owners operated 177,986 farms; managers, 3,065 and tenants, 75,644. White farmers numbered, 255,079 of whom 241,075 were native born: colored farmers numbered 1,616. Farms mortgaged numbered 50,784 and the mortgage debt was \$121,120,774. Farm expenditures for labor were, \$46,427,807; for fertilizer \$13,206,018; for feed \$40,378,027. The chief crops, with their acreage, yield and value for the year 1922 were: corn, 3,823,000 acres, 149,097,000 bushels, \$98,404,000; spring wheat, 28,000 acres, 420,000 bushels, \$491,000; winter wheat, 2,516,000 acres, 35,224,000 bushels, \$41,212,000; barley, 73,000 acres, 1,424,000 bushels, \$926,000; clover seed, 206,000 acres, 227,000 bushels, \$2,429,000; oats, 1,472,000 acres, 39,744,000 bushels, \$17,885,000; buckwheat, 25,000 acres, 500,000 bushels, \$400,000; rye, 87,000 acres, 1,235,000 bushels, \$1,025,000; tame hay, 3,374,000 acres, 4,892,000 tons, \$52,834,000; sorghum syrup, 4,000 acres, 248,000 gallons, \$260,000; potatoes, 126,000 acres, 11,214,000 bushels, \$10,093,000; sweet potatoes, 3,000 acres, 360,000 bushels, \$486,000; tobacco, 52,000 acres, 46,800,000 pounds, \$8,892,000; apples, 7,298,000 bushels; peaches, 1,584,000 bushels; and pears, 450,000 bushels.

Stock-raising.—Statistics furnished by the Department of Agriculture of the United States show that on 1 Jan. 1923 there were on the farms in the State 771,000 horses, valued at \$71,703,000; 32,000 mules, valued at \$3,104,000; 1,069,000 milk cows, valued at \$59,864,000; 857,000 other cattle, valued at \$27,167,000; 2,094,000 sheep, valued at \$14,867,000, and 3,091,000 swine, valued at \$37,401,000. In 1922 the clip of wool was over 13,000,000 pounds, while in 1916 it was but 8,947,621 pounds. In 1919 there was produced in home dairies 30,264,265 pounds of butter and in factories and creameries 63,882,101 pounds. The cheese production was 434,042 pounds in the homes and 5,220,545 pound in factories and creameries. The production of eggs in 1919 amounted to 102,377,143 dozen.

Manufactures.—According to the latest reports available (Census of Manufactures, 1919

—Department of Commerce) the value of Ohio's manufactured products was \$5,100,308,728, the average number of wage-earners employed in its manufacturing industries was 730,733, and the value added by manufacture, which is the best measure of the importance of manufacturing industries, amounted to \$2,188,360,857. In 1919 Ohio ranked fourth among the States in value of products, third in the number of wage earners, and third in the value added by manufacture. The value of manufactured products in Ohio in 1919 represented 8.2 per cent of the total for the United States. The corresponding proportions for 1909 and 1904 were 7 per cent and 6.5 per cent respectively.

A summarization of the industries of Ohio shows a wide range of character and high valuations in capital and production. In the manufacture of rubber goods, Akron being the leading point of the industry, which includes rubber tires, clothing, mats, type, springs, tubing, brushes, bands, etc., Ohio held first rank both in 1919 and 1909, the value of products for the industry in the State representing 48.5 per cent of the total value of products for the industry for the United States in 1919 and 42 per cent in 1909. In the manufacture of automobiles, including bodies, parts and accessories, Ohio ranked second among the States in 1919 as in 1914. There was an increase of 37,130 or 144 per cent in the average number of wage-earners employed from 1914 to 1919 while the value of products increased \$293,725,893, or 342.7 per cent, and value added by manufacture \$862,772,000, or 312 per cent during the same period. In electrical machinery, apparatus and supplies, Ohio ranked second in 1919, having advanced from 20th place in 1909. In the manufacture of tin plate and terneplate Ohio ranked second, reporting 8.4 per cent of the total products of the United States in 1919. In the value of paper and wood pulp produced Ohio ranked seventh, having held sixth position in 1904 and 1909, the value of the products being in 1919 \$55,098,000. In the production of butter, cheese and condensed milk the State ranked fifth. The principal industries, ranked by value of products in 1919, were: iron and steel, steel works and rolling mills, \$626,370,000, in the production of which the State stood second; rubber tires, tubes, and rubber goods, \$551,118,000; foundry and machine shop products, \$347,635,000; automobiles, \$287,046,000; iron and steel blast furnaces, \$179,233,000; slaughtering and meat packing, \$170,338,000; electrical machinery, apparatus and supplies, \$156,924,000; cars and general shop construction and repairs by steam railroads, \$96,484,000; automobile bodies and parts, \$92,391,000; flour and grist mill products, \$89,397,000; bread and other bakery products, \$78,819,000; boots and shoes, not including rubber boots and shoes, \$71,355,000; machine tools, \$62,554,000; printing and publishing, newspapers and periodicals, \$58,567,000; men's clothing, \$58,169,000; steel shipbuilding and repair work, \$56,482,000; paper and wood pulp, \$55,098,000; women's clothing, \$48,704,000; coke, not including gas-house coke, \$46,514,000; food preparations, not otherwise specified, \$46,340,000; petroleum refining, \$43,283,000.

The manufacturing importance of the State is due to its ample natural resources as detailed under *Minerals and Mining*, and *Forests*, and

their accessibility by waterways and rail, which led to an early introduction of domestic manufactures along with the chartering of a trading and banking company in 1803. Cleveland and Cincinnati are the chief industrial centres. Cincinnati long held the lead, but has apparently attained its maximum, while Cleveland is still increasing. From 1800 to 1850 Cincinnati was the centre of an extensive hog raising region, and during that period was the most important meat-packing city in the United States; the manufacture of tobacco is also a leading industry of Cincinnati. The manufacture of foundry and machine shop products, including engines, boilers and machinery of many varieties, is carried on extensively in all the leading cities of the State, but chiefly at Cleveland and Cincinnati. Youngstown, in the Mahoning Valley, is the leading city in the State in the iron and steel industry. Mining machinery is made at Columbus and Akron, machine tools at Hamilton. Pottery is produced at Cincinnati, Akron, Zanesville, Roseville and East Liverpool, the last town manufacturing over 49 per cent of the white granite ware and semi-vitreous porcelain of the United States. Toledo is one of the granaries of the country with important flouring and grist mills, and Springfield and Canton lead in the manufacture of agricultural implements.

In 1919 the value of the manufactured products of some of the more important cities was as follows: Akron, \$558,962,067; Canton, \$124,292,924; Cincinnati, \$500,040,996; Cleveland, \$1,091,577,490; Columbus, \$184,021,849; Dayton, \$174,990,607; Springfield, \$67,759,001; Toledo, \$293,520,900; Youngstown, \$241,458,370.

Commerce and Transportation.—The foreign commerce of the State carried on through Cleveland, Cincinnati, Toledo and Sandusky, the four ports of entry of the United States customs districts of the region, is practically unimportant, compared with the enormous domestic commerce over the waterways and the railways of the State. The Ohio River, forming the southern boundary of the State for 436 miles, and its tributary, the Muskingum River, navigable for several miles above Zanesville, have formed for over a century one of the great highways of internal commerce, affording cheap communication with western Pennsylvania and the entire Mississippi valley; notwithstanding the advent and competition of railroads, their waters still bear the larger freight of coal, lumber and the heavier articles of transportation. Two canals originally connected Lake Erie with the Ohio River, one from Cleveland to Portsmouth, and the other from Toledo to Cincinnati; but at the present time there is no connection with the lake and river by either, owing to abandonment and decay. Lake Erie and the Erie Canal afford water communication with the Atlantic seaboard; and the northwest States are reached via the western Great Lakes and the Sault Sainte Marie Canal.

The construction of railroads dates from 1832 and the incorporation of the Mad River and Lake Erie Railroad, now absorbed in the Big Four system. The railway mileage of the State in 1919, including main line, second line, branches and side tracks, was over 9,000 miles. The great lines traversing the State are the Baltimore and Ohio, the Lake Shore and Michigan Southern, the Pennsylvania, the Erie, the

Cleveland, Cincinnati, Chicago and Saint Louis, and the New York, Chicago and Saint Louis. The consolidation of the railroads is proceeding gradually, and nearly all the local lines together with the Lake Shore and Michigan Southern and the Baltimore and Ohio are now controlled by larger corporations. The State is provided also with a network of interurban electric railroads connecting almost every populous centre, and ranking first among the United States in the extent of its mileage.

Banks.—The first bank of the State was a private institution, which was virtually a private company to which the privilege of doing a banking business had been granted. Five banks were established before 1813, all by special act of the legislature. The first government bank in the State was established in Cincinnati in 1817. This "innovation," as it was called; met with great opposition, and various methods were suggested whereby the United States bank might be suppressed or induced to leave the State. From 1817 to 1836 there were 25 banks established. In 1836 an effort was made to establish a second United States bank, but the legislature passed a special act preventing its establishment. A number of private and unauthorized banks were established between 1840 and 1850. The failure of several of those banks caused losses to many people, and led to the passage of prohibitory laws regarding the establishment of unauthorized banks by the legislature of 1845. The law proved ineffective, and a free banking law was passed in 1851. So much had public opinion changed, that in 1863 nearly all the State banks became national banks. In the panic years of 1873, 1884 and 1893 there were many bank failures in the State, nearly all of which were confined to private and State banks. In 1900 the high prices of United States bonds and other reasons caused a reaction in favor of State banks. From 16 Nov. 1900 to 15 Nov. 1902 inclusive, there were established in the State 42 banks, savings and loan associations. During the same period there were established 20 building and loan associations. In 1922 there were in the State 644 State banks (which includes all banking institutions other than private and national banks); 106 private banks and 372 national banks, making in all 1,122 authorized banking institutions. In 1922 there were 787 building and loan associations with assets of \$525,696,242, and 1,152,121 members. Since the year 1908 all the banking institutions of the State, except national banks, have been under the supervision of a State superintendent of banks, with an adequate force of examiners and other expert assistants. The powers vested in the banking department are very extensive and detailed and, so far as examinations are concerned, are regarded as even more effective than those which govern the national institutions. The authority of the department extends not only to all State incorporated banks and savings banks, but to trust and safe deposit companies, not including, however, building and loan associations, which are under the superintendence of another State department. Annual reports, published by the superintendent of banks, show the condition in detail of every concern within the scope of the department.

Finances.—Prior to 1825, Ohio had no debt. The first State debt was contracted that year.

for the construction of canals (see *History*). Later the debt was augmented for other canals, subscriptions toward railroads and roads, and in 1833 the State debt was \$16,880,000, in 6 and 7 per cent bonds. The incomes from canals and a special tax were devoted to the public debt. The State credit remained unimpaired, so that when necessary it was able to borrow further sums. The years 1838–40 brought financial ruin to many enterprises throughout the Union, and made the borrowing of large sums a matter of difficulty. To have discontinued the public works would have caused great loss, so in 1843 the State issued 7 per cent bonds. The canals absorbed the school fund, the sinking fund and the proceeds from sale of public lands, and by 1856 the debt had been reduced nearly \$3,000,000. A further debt of \$2,423,349 was incurred in 1856, after which the whole was gradually decreased.

In 1880 the State debt was \$6,476,805. In 1903 the remaining portion of the funded debt, \$200,000, matured and was paid, together with \$6,000 of interest money. A special university fund was created in 1892. The income of the State is derived from a general tax. The balance in treasury at the beginning of the fiscal year 1921–22 was \$14,326,673.95. Receipts during the year amounted to \$56,929,119.73. Disbursements for the same period to \$51,698,436.12, leaving a balance on hand at the beginning of the fiscal year 1922–23 of \$19,957,357.56. The estimated receipts for 1922–23 were \$43,373,950. The bonded debt of the State in 1922 was \$25,000,000 and the floating debt, \$1,665, making a total State debt of \$25,001,665. The assessed value of real property was \$6,386,334,425; of personal property, \$4,358,323,898.

Education.—The Territory of Ohio received its first grant of land for public education in 1785; the Continental Congress reserved for school purposes the 16th section in every township. Later grants were made by Virginia, the Western Reserve and certain Government Military reservations. No common school system was established until 1825; the law was passed the same day as the law providing for the construction of canals (see *Finances*). In 1827 provision was made for selling school lands. Further legislation was enacted from time to time, that of 1873 provided for the classification of school districts, and making obligatory the use of the English language in teaching all branches to be taught in the schools. The German language had been used in many schools. Prior to the establishment of the common school system, there had been founded a number of schools, some private and others by churches or communities. The Ohio University (q.v.) at Athens was founded in 1804 and the Miami University (q.v.) in Oxford in 1809. The legislature of 1901–02 passed a bill, which became a law 12 March 1902, establishing normal schools, for the training of teachers. This law provides for two schools in connection with the Ohio University at Athens and the Miami University at Oxford. These schools are known as State normal schools, they are to be supported by an income from the "Ohio and Miami University Fund," created with the bill. The income is derived from a direct tax. The legislature at the same session passed bills which classify the different grades of schools and provide for examinations for entrance to

high schools. The Child Labor Law and the Compulsory Education Laws were rewritten and made to harmonize. Children between the ages of 8 and 14 were compelled to attend school the full time and children between the ages of 14 and 16, not engaged in some regular employment, were also required to attend; and if the child over 14 and under 16 could not read and write the English language he had to attend the full time. Heavy penalties are provided for the violation of the compulsory education laws. The centralizing of township schools began in Ohio some years ago, when the matter was optional. The first legislation on the subject, in Ohio, was enacted in 1892. The teachers' institutes, teachers' pensions, the school curriculum, all receive wise and almost constant attention. The principal cities have city training classes for persons who intend to become teachers.

According to the 14th Census of the United States the number of children in Ohio of school age (5 to 20 years) in 1920 was 1,614,777 of whom 1,095,577 were reported as attending school. Corresponding figures for 1910 were 1,405,040 and 881,138 respectively. Illiterates in 1920 numbered 131,006 or 2.8 per cent of the entire population. In 1910 illiterates numbered 124,774 or 3.2 per cent of the entire population that year. School attendance is now compulsory during the full term for children from six to 18 years of age. In 1921 there were in the State 9,788 public elementary schools, employing 26,635 teachers (3,318 men and 23,317 women), and with 876,249 enrolled pupils (447,832 boys and 428,417 girls). In the same year public high schools numbered 639. These gave employment to 7,657 teachers (2,817 men and 4,840 women) while the pupils enrolled numbered 153,881 (71,151 boys and 82,730 girls). The expenditure for education in 1921 amounted to \$60,408,201. Many parish schools are maintained by the Roman Catholics and Lutherans. For higher learning there are a number of colleges and universities which are dealt with under their corporate names.

Religion.—The Roman Catholics have, according to the 'Catholic Directory 1921,' 889,423 members. The Methodists claim one-fourth of all the church members of the State. The other Protestant denominations rank as follows: Presbyterians Lutheran, Baptist, Disciples of Christ, Congregationalists and Protestant Episcopalians. The Protestants have large and well organized Sunday schools connected with all their churches. The Roman Catholics have Sunday schools also, but where the parish school has been established, the attendance at the Sunday school is usually limited to those not receiving religious instruction during the week.

Charitable and Penal Institutions.—The State board of charities consists of seven members; six of whom are appointed by the governor; the governor of the State is ex-officio a member and is president of the board. A secretary is appointed by the board. The board has the supervision of all State and municipal institutions, including infirmaries, jails and orphanages, or all institutions for furnishing relief or for correction. The State law further provides that this board shall examine, for criticism or approval, all plans for charitable

or penal institutional buildings, or changes in buildings. There are 17 State institutions, as follows: State hospitals at Athens, Cleveland, Columbus, Dayton, Longview, Toledo; the Ohio Hospital for Epileptics, Institution for Deaf and Dumb; State School for the Blind; Industrial Home for Girls; Industrial School for Boys; homes at Xenia and Sandusky; a State penitentiary and a State reformatory. The municipal institutions are workhouses at Canton, Cincinnati, Cleveland, Columbus, Dayton, Toledo, Xenia and Zanesville, and a House of Refuge at Cincinnati. The county institutions are infirmaries, homes and jails. Outdoor relief is given by infirmary doctors, township clerks and under the direct supervision of the Soldiers' Relief Commission. Changes have been made in the care of epileptics, who are housed in a hospital at Gallipolis. The Juvenile Court, at Cleveland, has shown there are great opportunities for the prevention of the crimes often committed by the young and how they may be reclaimed. The annual State Conference has been productive of much good. Each county has a board of county visitors.

The annual expenses of the State institutions are considerably over \$2,600,000; for the municipal institutions, \$150,000; for the county institutions, \$2,127,000, making for the whole a total considerably over \$5,000,000. A National Soldiers' Home is located at Dayton. It has accommodations for 6,000 persons. The Roman Catholic charitable institutions of the State are 14 orphan asylums, having nearly 2,000 inmates; three industrial schools, 450 inmates; 19 hospitals, over 12,000 patients each year; four homes for the aged, about 500 inmates each year; three homes for the friendless, about 200 inmates each year.

Government.—The State constitution now in force was adopted in 1851 and is the second one under which Ohio has been governed. (See *History*). Provisions for a constitutional convention are arranged for in two ways. "Shall there be a constitutional convention?" is a question submitted to the people at a popular election each 20th year and a majority vote in the affirmative is followed by the proposed convention. A constitutional convention may be called at any time if two-thirds of the members of each branch of the legislature demand it and if a majority of all the legal votes cast at a popular election favor it. Amendments may be added as follows: The amendment may originate in either branch of the legislature; it must be approved by three-fifths of the members of each house and by a majority of the electors voting at a popular election. If there are several amendments, each one must be voted upon separately. The right to vote implies citizenship, residence in the State for one year, in the county, township or voting district such a time as may be determined by the general law for the State. Further limitations take into consideration sex, age and sanity. The right of suffrage may be withdrawn from any person, by the legislature, for certain causes, as bribery, perjury and other crimes. Voters are obliged to register as required by law, in cities of 9,000 population or over. The State sends to Congress 22 members. The government of the State is administered by the legislature, the executive and the judicial departments.

Legislature.—The senate and the house of representatives constitute the legislature. The number of members is based upon the population and is determined by the legislature. Most of the counties have only one member in the lower house, but some of the smaller counties are united with other counties for representation. For senatorial representation many of the counties are united; but some of the large counties are separate senatorial districts. A county may be made a separate senatorial district if it has the population required for a full senatorial ratio and if a full senatorial ratio is left in the county or district from which it asks separation. The regular sessions of the legislature are biennial, beginning on the first Monday of January each odd-numbered year. The members are chosen by popular vote for two years, the day of election being the first Tuesday after the first Monday in November. The salaries of members are fixed by law. Bills may originate in either house; each bill can contain but one subject. The lower house impeaches and the senate tries all impeachment cases; the concurrence of two-thirds of the members of the senate is requisite for a conviction.

Executive.—The governor and his associate officers—lieutenant-governor, secretary of State, State treasurer and attorney-general are elected for two years, at the general State election. The auditor is elected for four years; the board of public works and the school commissioner for three years. The governor appoints the superintendent of insurance, commissioner of railroads and telegraphs, State and law librarians, gas commissioner and supervisor of public printing. He has the power to call extra sessions of the legislature and the usual veto and pardoning powers. In the absence of the governor, for any cause, the lieutenant-governor, president of the senate or speaker of the house are in the line of succession.

Judicial.—The judicial power is vested in the Supreme Court, Circuit Courts, Courts of Common Pleas, Courts of Probate and Justices of the peace. Other courts inferior to the Supreme Court may be established by the general assembly. The general assembly may establish courts of conciliation and limit their duties and powers, but the judgment of such courts is not final except the parties interested agree to abide by such decision. The judges and justices are chosen by popular vote. The judges of the Supreme Court are chosen for a term not less than five years, the judges of the Common Pleas for five years, the justices of the peace for three years.

Local Government.—The legislature provides by law for the organization and powers of cities and incorporated villages and for the election of county and township officials. The terms of office of county officers do not exceed three years.

Laws.—The legal rate of interest is 6 per cent, but 8 per cent may be obtained by contract. Pure-food laws have been passed and are rigidly enforced. Divorces may be obtained for several causes—wilful absence for three years, extreme cruelty, habitual drunkenness, imprisonment in the penitentiary, adultery, divorce procured by either party in another State,

are the chief causes. Restrictions as to time of residence in the State are enforced.

Militia.—The number of men of militia age is about 2,499,963. On 31 May 1923 the State militia had an authorized strength of 11,430 men and an enlisted strength of 7,923 men. These figures include 7,241 division troops and a State staff of 12. During the Civil War, Ohio furnished one-eighth of the Federal troops.

Political Divisions.—There are 88 counties in the State. The Federal census of 1910 gave the population of the nine largest cities as follows: Cleveland, 560,663; Cincinnati, 364,463; Toledo, 168,497; Columbus, 181,548; Dayton, 116,577; Youngstown, 79,066; Akron, 69,067; Springfield, 46,921; Canton, 50,217. Columbus is the capital of the State. The population of the above cities according to the 14th report of the United States Census was on 1 Jan. 1920, as follows: Cleveland, 796,841; Cincinnati, 401,247; Toledo, 243,164; Columbus, 237,031; Dayton, 152,559; Youngstown, 132,358; Akron, 208,435; Springfield, 60,840; Canton, 87,091.

History.—Numerous evidences of prehistoric Ohioan inhabitants are found in the mounds existing in different parts of the State. The study of any one of these mounds, especially of the type of the fort in Adams County, shows the degree of advancement of the people now called the Moundbuilders (q.v.). The first appearance of Ohio in history is when Robert Cavalier de LaSalle left his home at LaChine, near Montreal, Canada, in 1669, on a journey of adventure, before his return he discovered the Ohio River and ascended on its waters near where Louisville now stands. When LaSalle later vested in France the title of the Mississippi Valley by discovery in 1682, the area of what is now known as Ohio became a French possession and remained such until the Treaty of Paris in 1763 when it became territory of Great Britain.

The first English-speaking settlement made in Ohio was established at the mouth of Laramie's Creek, on the Great Miami River in what is now Shelby County. This settlement was made in 1749 and was called Pickawillany. In June, 1752, the French, with their Indian allies, the Chippewas and Ottawas, massacred these white settlers and wiped out the first English settlement in what is now Ohio. In 1748 some English and Virginian gentlemen organized what was known as the "Ohio Land Company," for the purpose of settling the newly-discovered Ohio Valley. Their settlements aroused the intense antagonism and jealousy of the French and the result was an attempt on the part of the French to stop these intrusions into her territory and England to persist in continuing them. In 1753 The Ohio Company complained to Governor Dinwiddie of the interference by the French authorities and the governor sent George Washington, a young man of 23, to endeavor to terminate the friction by peaceable negotiations. He was unsuccessful, however, and the conflict continued until finally peace came from the Treaty of Paris, signed 18 Feb. 1763, by the terms of which the vast territory of which Ohio was a part became the possession of Great Britain. After 10 years of peace the murder of nine kinsmen of the Iroquois chief Logan by a borderer named Greathouse, caused an upris-

ing of the Indians and in 1774 a campaign against them was inaugurated by Governor Dunmore of Virginia, which is known in history as Lord Dunmore's war. It was in this campaign, in the heart of the Indian country along the Scioto River, that the celebrated speech of Logan, the Mingo chief, was delivered.

When the war for independence came on, the Continental Congress, regarding the Northwest Territory as a good heritage to preserve for American supremacy, fortified various points in what is now known as Ohio, the earliest of which was Fort Laurens, the first military stockade erected by American authority in Ohio. This fort was abandoned in 1779. In 1780 and the five years following, Ohio was the theatre of active warfare against the Indians and under the leadership of Col. John Beaman, of Kentucky, the Indians were attacked on the Little Miami River in what is now Greene County, and by Col. George Rogers Clark at other points contiguous. In this period occurred various scenes indicative of the terrible condition of feeling existing between the Indians and whites. There were massacres on both sides characterized by brutality and savagery. The year 1782 opened with a number of atrocious deeds of violence by the Indians. Innocent women and children were murdered in the most horrible manner. The whites were exasperated, and in February of this year Colonel Williamson led an expedition against the Indians. They marched into the Tuscarawas country in eastern central Ohio and massacred in cold blood and with brutal vengeance the Moravian Indians, a peaceable and Christian tribe that had never raised their hands against the whites nor participated in any of the troubles between the Americans and English. Later in May of the same year Col. Wm. Crawford marched 500 men through the Ohio country from where Steubenville now stands to the Wyandot country on the Sandusky River, near where Upper Sandusky is now located. His attack resulted in defeat with a loss of over 100 of his men and the capture of Colonel Crawford himself. Colonel Crawford was burned at the stake by the Delaware Indians in retaliation for the murder of some of their tribe by Colonel Williamson's men.

These Indian campaigns and wars, up to 1782, while they were the outgrowth of adventure upon the part of the Pennsylvanians and Virginians, were sanctioned by the Continental Congress and by the various colonial governments.

When peace came through the Treaty of Paris, which was signed 3 Sept. 1783, all the territory east of the Mississippi River was relinquished to the United States by Great Britain. A part of the acquisition was what was known as the Northwest Territory (q.v.), which added 240,000 square miles to the United States. In October 1787, the Federal government sent 700 troops to the frontier to protect this territory and to emphasize to the Indians that the white man's government had commenced. On 5 October Congress elected officers for the new government. Arthur Saint Clair was named as governor and with him were designated James M. Varnum, Samuel Holden Parsons and John Armstrong as judges and Winthrop Sargent as

secretary of the territory. Mr. Armstrong declined to serve as judge and John Cleve Symmes was named to fill the vacancy. On 9 July 1788, Governor Saint Clair and his associate officers arrived at Fort Harmer where they remained until the 15th when they entered Marietta as the representatives of the National government.

The first settlement in the Northwest Territory was effected under the control and direction of Gen. Rufus Putnam, who had formed "The Ohio Company of Associates" in Boston on 1 March 1786. General Putnam with his little band of emigrants journeyed from Connecticut to the banks of the Ohio in the winter of 1787-88 and on 7 April they landed in the rain at the mouth of the Muskingum River and founded Marietta (q.v.).

Governor Saint Clair, as before stated, inaugurated the reign of law and on 2 September the first court ever held on Ohio territory was opened with formal ceremonies at Marietta. The second settlement in Ohio was made at Columbia, about five miles above Cincinnati. Major Benj. Stites of Pennsylvania purchased 10,000 acres from Judge Symmes near the mouth of the Little Miami. On 18 Nov. 1788, 26 hardy Pennsylvanians located at this point, erected a block house, laid off a little town and called it Columbia. While the major was laying off the town of Columbia, Mathias Denman, with Robert Patterson and Israel Ludlow laid off a town on the high north bank of the Ohio River and opposite the mouth of the Licking River. About 28 Dec. 1788, Denman and his companions, 15 in number, landed at this site and founded the city of Cincinnati (q.v.).

In February 1789, North Bend, near the Indiana line, was settled by Judge Symmes and his associates. For the protection of the three settlements at Cincinnati, Columbia and North Bend, Fort Washington was constructed at Cincinnati, which was then the principal centre of the Miami country. On 2 Jan. 1790, Governor Saint Clair arrived at Fort Washington and issued his proclamation establishing Hamilton County. The county-seat was fixed at Cincinnati. This was the beginning of the great State of Ohio. It absorbed the population of North Bend and Columbia and in 1795 its population were soldiers.

The next settlement in point of time was at Gallipolis. October 1790, 400 French emigrants settled at this place and in memory of their native land called it Gallipolis. They were induced to make settlement here by the picturesque and highly colored representations made to the French people by Joel Barlow who went to France in 1788 to represent the Scioto Company (q.v.), for the purpose of putting its lands upon the market. The settlers were unqualified and unfitted for the hardship of pioneer life, and this fact, in addition to the one that the title to the lands was defective, broke up the settlement. Many of them drifted further west to Detroit and Kaskaskia and some remained and purchased their land from the Ohio Company. Congress, in 1795, sympathetically granted 24,000 acres of land to these defrauded emigrants. This land is in the eastern part of Scioto County on the Ohio River and is known by reason of its history, as the "French Grant."

At Manchester, on the Ohio River, in 1791,

Col. Nathaniel Massie made the first settlement in the Virginia Military District. This composed the territory between the Scioto and Little Miami which had been reserved in the deed of cession by Virginia for bounty land for her soldiers.

In 1796 Colonel Massie, assisted by Duncan McArthur, laid out and founded the town of Chillicothe. The opening to emigration of the far-famed land of the Shawnees attracted many settlers from Virginia and Chillicothe in a short time became an important and populous town.

The settlements referred to thus far were in the southern and central portions of the State and it was not until 1796 that emigration commenced to develop in the northern part. Gen. Moses Cleaveland, as agent for the Connecticut Land Company, with 52 Connecticut settlers, on 4 July 1796, landed at the mouth of Conneaut Creek, in Ashtabula County, for the purpose of settling the Western Reserve. In addition to being settlers, many of them were surveyors. On 26 July 1796, Cleaveland and his associates proceeded to the mouth of the Cuyahoga River and laid out the chief settlement of the Western Reserve. It was named Cleveland, in honor of the leader of the expedition.

The pioneers of the Western Reserve that settled at these points suffered many privations and the country did not grow as rapidly as those further south and in 1798 there were but 130 persons in the whole Reserve.

Ohio now commenced to grow with considerable rapidity and settlements sprung up and developed in every quarter. In 1799 there were in existence and enjoying peace and prosperity the towns of Marietta, Columbia, Cincinnati, North Bend, Gallipolis, Manchester, Hamilton, Dayton, Franklin, Chillicothe, Cleveland, Franklin, Steubenville, Williamsburg and Zanesville. Their prosperity and safety was accomplished through much tribulation and danger, for during the period of their development the territory had passed through its second war with the Indians, to which a retrospect is necessary.

Notwithstanding that on 9 Jan. 1789, at Fort Harmer, Governor Saint Clair made a treaty with the Six Nations and the representatives of the Wyandots, Delawares, Chippewas, Ottawas, Pottawatomies and Sacs, he failed to secure the good-will of the Indians. Marauding parties and forays on the part of the savages continued, to be projected against the whites, evidently instigated by the English. Accordingly, in September 1790, Saint Clair, with a little army, gathered from Pennsylvania, Virginia and Kentucky, amounting to about 1,400, of which 300 were regulars, marched against the Indians. He was overwhelmingly defeated. Owing to a failure to control the militia and lack of general discipline, the battle resulted in a rout. After the defeat of Saint Clair, Gen. Anthony Wayne, one of the most daring officers of the Revolution, was placed in charge of a campaign against the Indians and spent the spring and summer of 1793 at Fort Washington in Cincinnati, drilling and recruiting his men. In October 1793 he left Fort Washington with an army of 3,000 well-equipped soldiers and proceeded to six miles beyond Fort Jefferson, where he erected Fort Greenville, near where Greenville, Darke County, is now situ-

ated. He spent the entire season here and in the spring of 1794, after making many efforts to enter into a treaty of peace, he attacked them on 20 August, defeating them with great slaughter. Nine of the Wyandot chiefs were killed and the Indian question was solved forever in Ohio. This engagement was known as the Battle of Fallen Timbers, on account of the breastworks of fallen trees behind which the Indians were massed. The result of this campaign was a treaty of peace which was known as the Treaty of Greenville, which was signed by the chiefs of the 12 hostile tribes at Fort Greenville, 3 Aug. 1795. By the terms of this treaty the Indians released extensive territory between the Lakes and the Ohio River and the United States gave them \$20,000 in merchandise and \$9,000 annually, to be divided among the several tribes. This was the last Indian warfare in Ohio.

With peace the population of the territory began to increase. In 1790 there were about 3,000 white inhabitants in Ohio; five years later there were 15,000 white persons in the Northwest Territory and by 1798 there were 5,000 free male persons of full age within its boundaries and under the Ordinance of 1787 this entitled the people to a territorial legislature. Accordingly on 29 Oct. 1798, Governor Saint Clair issued his proclamation fixing the day for electing territorial representatives on the third Monday of December following. Thus the Territory of the Northwest passed into its second or legislative grade of government.

During the years preceding this change, barring the Indian troubles, the settlers were progressing satisfactorily. Religion and literature were planted in Ohio. The first church in the territory was erected in 1790 at Columbia and on 9 Nov. 1793, the first newspaper was printed by William Maxwell of Cincinnati, under the name of *The Sentinel of the Northwest Territory*.

The first territorial legislature met at Cincinnati, 4 Feb. 1799. Edward Tiffin of Ross County was elected speaker of the first general assembly of the Northwest Territory, and Henry Vanderburgh president of the council. William Henry Harrison, afterward President of the United States, was elected the first delegate to Congress from the territory. A bitter conflict between the governor and the legislature commenced at this time. Saint Clair was a Federalist and he was opposed by the followers of Mr. Jefferson in the territory. At this time the vast Territory of the Northwest was divided into two districts—the dividing line ran from the mouth of the Kentucky River to Fort Recovery, and northwest to the boundary line between Canada and the United States. West of this line was erected the Territory of Indiana, of which Mr. Harrison was appointed governor, and east of the line was the Territory of the Northwest, of which Chillicothe was designated the seat of government. On 19 Dec. 1799 Governor Saint Clair, exercising the power vested in him by the Ordinance of 1787, dissolved the territorial legislature and fixed the first Monday in November 1800, as the date of its next session.

The second session of the territorial legislature met at Chillicothe on 3 November, and after being in session five weeks adjourned on 9 December. William Henry Harrison having

resigned his position in Congress, William McMillan of Cincinnati was elected to fill the vacancy and Paul Fearing of Marietta to serve the succeeding term. At this time Ohio had a population of 42,000. Transportation and trade were increasing on all hands. On the Ohio River there were packets running regularly for mail and traffic between Cincinnati and Pittsburgh, making the round trip in about four weeks. The first vessel of any size or importance was the brig *Saint Clair*, built at Marietta, of 110 tons burden. It was loaded with provisions, sailing down the Ohio, Mississippi and across the Gulf of Mexico, and finally landed safely in Philadelphia. Transportation by land was by the heavy and cumbersome trading wagons drawn by four and six horses. Cincinnati was a great distributing point for the southern and central part of the territory.

The iron used in the territory came from Pittsburgh and Baltimore, and when from the latter cost \$200 a ton for transportation to the interior of Ohio. The southern and central parts got their supply of salt from the "Ohio Salt Works," located in what is Jackson County of to-day. It sold at the works for two and three dollars a barrel, and after the journey homeward of 100 miles the purchaser sold it to his neighbors for seven dollars a barrel. These were some of the general conditions of the people in what is now Ohio in 1800. There were no vehicles except for burden in the territory. Marietta was the stronghold of Federalism and Chillicothe was the seat of Republicanism, and there were bitter conflicts between the followers of Alexander Hamilton and Thomas Jefferson. Cincinnati was divided almost equally in politics.

The third territorial legislature commenced on 24 Nov. 1801. At this session Cincinnati and Chillicothe were incorporated and the seat of government changed from the latter town to the former.

On 3 April 1802, Congress passed an act enabling the people of Ohio to form a constitution and State government. This was the result of a persistent controversy between the followers of Jefferson and the Federalists. In pursuance to that law of Congress the constitutional convention met at Chillicothe 1 Nov. 1802 and adopted a constitution for the State. It was never submitted to the people. The intense feeling against Saint Clair on account of his vetoes eliminated the veto power from the governor. The convention fixed the capital at Chillicothe until 1808, and named the boundaries of the State. On 19 Feb. 1803, Congress of the United States extended the jurisdiction of the Federal courts over Ohio.

On the second Tuesday of January 1803, the election for governor was held. Edward Tiffin, the candidate of the anti-Federalists, was elected. On Tuesday, 1 March 1803, the first legislature met at the State capitol at Chillicothe. Nathaniel Massie was elected speaker of the senate and Michael Baldwin speaker of the house. Officers provided under the constitution were appointed as follows: Secretary, William Greighton, Jr.; auditor of State, Thomas Gibson; treasurer of State, William McFarland; judges of the Supreme Court, Return J. Meigs, Jr., Samuel Huntington and William Spriggs. At this session Thomas

Worthington and John Smith were elected United States senators from Ohio.

In 1805 Aaron Burr (q.v.), the ex-Vice-President, visited the west and spent considerable time in Ohio, accumulating boats, provisions and accoutrements for the carrying out of his treasonable designs, which were frustrated through the activity of Governor Tiffin. For this act Tiffin received the thanks of the President of the United States. On the ground of being suspected as an accomplice of Burr, John Smith, one of the senators from Ohio to the United States Senate, was charged with treason, and after a complete investigation by the Senate a motion was made to expel him, 9 April 1808, but failed for want of the requisite two-thirds vote. He resigned, however, at the request of the general assembly of Ohio, and Return J. Meigs, Jr., was elected in his stead.

The first seven years of Ohio's estate was a period of marvelous advancement. The population in 1810 was 230,760, an increase of more than 400 per cent over that of 1800. The immigration was healthy and valuable. New counties were erected and out of the wilderness came wealth, so that in 1810 the taxable property of Ohio was valued at \$25,000,000. The natural resources of the State became known and developed. The first blast-furnace was operated in Mahoning County; coal was first mined in 1810 in Summit County.

Education advanced materially (see paragraph on *Education*). By 1810 there were 14 newspapers in Ohio, representing the two contending parties of the day. The populations of the towns throughout Ohio continued to increase. Cincinnati ranked first in importance and in size. Its population had increased to 2,540. On the whole, Ohio was occupying a positive and prominent position in the Union.

The first steamboat to navigate the Ohio River was launched at Pittsburgh and called the *New Orleans*. It descended to Louisville and continued to make trips between that place and Cincinnati. With this event began a new era in the business development of the Ohio, and the value of the Ohio River as a channel of transportation became more apparent than ever to the people of the new State. In 1810 as a result of political feeling in the legislature, the seat of government was transferred from Chillicothe to Zanesville.

On 14 Feb. 1812, the legislature changed the seat of government from Zanesville to Chillicothe, but at the same time provided for the permanent establishment of the capital at Columbus.

In the second war with England, which was finally declared by the United States 18 June 1812, Ohio played an important and patriotic part. She furnished regiments to General Hull at Detroit, and resented his cowardly surrender. Under Gen. William Henry Harrison the soldiers of Ohio were chief in his movements in the northwest in the war against England. Governor Meigs in the meantime calling out, as necessity required, the quota of men assessed upon Ohio. At Fort Meigs, at Fort Stephenson and at other points throughout the State there were conflicts with the British, and at Lake Erie, through Oliver H. Perry, a young sea-captain from Rhode Island, the English supremacy upon the northern lakes and upon the

line of the northwestern boundary was destroyed forever. The battle of Lake Erie was the last engagement of the War of 1812 that occurred within the territorial limits of Ohio. To the expense of this war Ohio contributed over \$300,000. Governor Meigs, on account of his patriotic services to the country, was made post-master-general in President Madison's Cabinet.

The general assembly met for the first time in Columbus on 2 Dec. 1816, and it has assembled there ever since. In this year the State Library was founded by Governor Worthington, and from a few volumes gathered by him it has grown to be a fine collection of more than 100,000 volumes.

The second United States bank, when re-chartered in 1816, opened branches in Ohio at Cincinnati and Chillicothe. This was the occasion for a long and severe contest between the officials of the State of Ohio and the United States government over the right of the former to tax branches of the United States bank. The general assembly passed a law taxing each bank \$50,000 and authorized the State government to collect it by force. After a long litigation it was ended in 1824 by the Supreme Court of the United States declaring the Ohio law taxing banks unconstitutional. The controversy was carried on largely by the advocates of the State banks on one hand and the opponents on the other.

In 1825 the State of Ohio commenced the construction of her canal system. The work was formally commenced 4 July 1825. Governor DeWitt Clinton of New York and Governor Jeremiah Morrow of Ohio initiated the labor of breaking the ground. After 10 years all that energy, men and money could do was directed to the canals. The Federal government aided and encouraged the construction by the donation of 1,100,351 acres of land. This land was sold and the proceeds, about \$2,200,000, were used for the construction of the canals. At the same time of the inauguration of the canal system the public school system was developed. By the association of the friends of internal improvement and popular education both of the great movements were accomplished.

Lafayette visited Ohio in 1825 and was made the formal guest of the State for days, amid the thundering of cannon and the acclamation of a grateful people.

Commencing in 1831 Mormonism flourished several years in Ohio. Joseph Smith with his followers settled in Kirtland, Lake County, in 1832. They built a building here in 1835 which was dedicated on 27 March 1837, in a ceremony witnessed by thousands of people. The Mormon Church grew in numbers, wealth and power for five years in this State; but finally, under the condemnation of public opinion and the enforcement of the law, crumbled away until its leaders and people, in 1838, fled from the State to beyond the Missouri River.

What is known in Ohio history as the "Toledo War," culminated in 1835. It was a dispute between Ohio and Michigan over the boundary line between these two States. There was involved in this controversy a strip of land the whole length of the northern Ohio boundary, five miles in width at the west end and over eight miles at the east end. It was rich agricultural land, but its chief charm was the harbor

where Toledo now stands. Both sides, through their governor and legislative bodies, asserted their respective jurisdictions over the mooted territory. So strong was the determination of each State to secure possession of the strip of territory which each claimed that the militia of both States were called out for a time and conflict was imminent. On 31 March Governor Lucas with his staff and 600 of the militia of Ohio appeared at the debated boundary line. In the meantime Governor Mason, with 1,000 men, arrived at Toledo, and there encamped fully determined to assert the jurisdiction of Michigan. In the meantime, however, two peace commissioners from the President of the United States arrived on the scene. The dispute was finally terminated on 29 Aug. 1835, by the removal of Governor Mason from his position as governor of the Territory of Michigan. Congress, at its next session in June 1836, decided in favor of Ohio. As compensation for the loss of this fertile strip of land Michigan was given the large and fertile peninsula between Lakes Huron, Michigan and Superior. Ohio thus settled her northern boundary and Michigan was given one of the richest beds of mineral ore in the world.

On 4 July 1839, the cornerstone of the present State house was laid in the presence of many citizens. The occasion was made one of public display and demonstration. Ex-Governor Jeremiah Morrow delivered the address and laid the cornerstone.

The census of 1840 found Ohio the third State in point of population, having 1,519,467 inhabitants; being an increase of 63 per cent over the population of 1830. At this time nearly one-third of the population was employed in manufacture and trade. Cities, while increasing in number, were still small in size. Cincinnati had 46,338 inhabitants; while Cleveland was a town of 6,000, and Columbus the same. In this decade the railroad system of Ohio was commenced.

In common with the rest of the country, Ohio was much agitated by the nomination and election to the presidency of Gen. William Henry Harrison in 1840. This was the first impression in a political way that Ohio made upon the country. Up to this time the State had but little influence at Washington. But the nomination of her citizen, General Harrison, at once made Ohio the battlefield of the contest. Great meetings, never equaled up to this time, were frequent in the State. General Harrison's march through Ohio was one triumphal procession of oratory, display and song. At Dayton a political meeting, addressed by General Harrison, numbered 80,000. At Chillicothe he spoke to 50,000 people. Political meetings at this time lasted for several days, just according to the number of orators. The "Log Cabin" campaign resulted not only in the election of Gen. William Henry Harrison to be President of the United States, but also Hon. Thos. Corwin was elected governor of Ohio.

In 1846 Ohio was again called to play an important part in the military affairs of the Union. War with Mexico was declared 13 May 1846, and Ohio sent out four regiments of volunteers and three independent companies. The total number of men furnished was 5,536; more than any other northern State.

In August 1846 the introduction of raw coal

as furnace fuel in lieu of charcoal, for iron-smelting, was an industrial event the effect of which on the wealth and growth of the State cannot be justly estimated. It gave a fresh impetus to iron manufacturing and allayed the painful doubt about its reliability raised by the diminution of the timber supply for the charcoal blast furnaces.

In February 1850, an act calling a second constitutional convention was passed. Nearly 50 years had passed since the forming of the first constitution and in the stupendous development of the State it was generally admitted that the instrument needed change and revision. After a session of 135 days the convention adjourned, and on the third Tuesday of June 1851, the constitution was submitted to the people and it was adopted by a pronounced majority.

The last vestige of what is known as the "black laws," that is laws that discriminated against the negro in Ohio by preventing him being a witness in court if a white man was party to the case, and by preventing his settlement in Ohio without giving bond and by imposing other restrictions, both unjust and unjustifiable, were repealed in 1849. Anti-slavery sentiment was strong in Ohio and the legislature of this period was known as the "anti-slavery legislature." Out of the public discussion of those days grew the Republican party, which held its first State convention in the State of Ohio in Columbus, 13 July 1855. In the election which followed Salmon P. Chase was elected governor, and on 14 Jan. 1856 commenced his gubernatorial term. Governor Chase's administration was signalized by the reorganization of the militia of the State. During this period the State was noted for its "Underground Railroad" (q.v.).

With the approach of the Civil War and in that crisis Ohio met every patriotic demand made upon her. When President Lincoln issued a proclamation, 15 April 1861, calling for 75,000 of the militia of the several States of the United States, the response was immediate from Ohio. Within 24 hours after the President's call 20 companies had proffered their services. Within 36 hours they were on their way to Columbus, where they were organized, 18 April, into the First and Second regiments of Ohio volunteers. The next day they started for Washington city. All this preparation was actively sustained by the legislature. On the day after the call to arms the senate passed a million-dollar appropriation bill for war purposes exclusively. Within three days it passed the house unanimously. The late President Garfield was at that time a member of the Ohio senate and took advanced ground in sustaining the Federal government. In the summer of 1863 the State of Ohio was subjected to the attacks of Gen. John Morgan, a daring Confederate raider, who entered the southern part of the State near Cincinnati and passed through southern Ohio; but after inflicting considerable damage, was eventually captured at Salineville, Ohio, 26 July 1863. Morgan's raid cost the people of Ohio \$897,000.

Ohio more than responded to the call of President Lincoln for troops, so that up to 1 Dec. 1864 she had furnished 346,326 to the service of the United States. Of these 11,237 were killed or mortally wounded and 13,354

died of disease. According to the adjutant-general's report for 1866 the people of Ohio paid for local bounties during the war \$54,000,000, and the military expenses amounted to over \$11,000,000, making the total expenditures chargeable to the Civil War over \$65,000,000.

For the third time, 14 May 1873, a constitutional convention assembled to prepare and present to the citizens of Ohio a new organic instrument of law; but they were satisfied with the constitution of 1851 and they rejected, on 18 Aug. 1874, the proposed constitution by a majority against it of 147,284.

The history of Ohio in these later days has been one of unbroken progress and prosperity. No stirring events have entered into her records save the marvelous developments of her people.

Ohio's part in the war with Spain was characterized by patriotism and promptitude. The President issued two calls for troops, 23 April and 25 May 1898. "So expeditious was the work of getting Ohio's quota ready for service," says Governor Bushnell in his annual message for 1900, "that a comparatively short time elapsed in camp life at the rendezvous. The entire mustering was completed in eight days. Ohio was the first State in the Union to put a volunteer regiment in the field." Under the first call Ohio furnished 428 officers and 8,052 enlisted men; under the second call, 73 officers and 6,801 enlisted men, making a total of 15,354.

In 1903 Ohio celebrated its centennial as a State of the Union at Chillicothe. The occasion was marked by appropriate ceremonies, formal addresses and literary papers on the various phases of Ohio's history and development.

The fourth constitutional convention assembled at Columbus 9 Jan. 1912. After a long session it offered to the people 41 amendments and a special proposition on licensing intoxicating liquors; of these all but eight were adopted, as well as the license proposition. Among the more radical amendments were proposals on the initiative, referendum and recall, which were adopted.

In March 1913 Ohio was visited by general and disastrous floods, the severest occurring in the Miami and Scioto valleys. In the Miami country, 400 people lost their lives and the property damage approximated \$150,000,000. In the Scioto Valley the loss of life reached 145 persons, and the property loss and damage was over \$25,000,000.

Of the Presidents of the United States eight were either born in Ohio or were residents of the State, viz.: William Henry Harrison, Ulysses S. Grant, Rutherford B. Hayes, James A. Garfield, Benjamin Harrison, William McKinley, William H. Taft and Warren G. Harding.

In the growth of population of Ohio she maintained her position as third State in the Union for 50 years, from 1840 to 1890, when she became the fourth in rank, having been outgrown by Illinois; but, notwithstanding, the percentage of increase for as old a State has been marvelous. From 1820 to 1850 the development of population was over 700 per cent, and it was more than doubled from 1850 to 1900. The population during the last four decades was (1890) 3,672,316; (1900) 4,157,545; (1910) 4,767,121; (1920) 5,759,394. In June 1920

Gov. James M. Cox and W. G. Harding were the Ohioan nominees for the Presidency.

GOVERNORS OF THE NORTHWEST TERRITORY.

NAME	Term of service
Arthur St. Clair.....	15 July 1788—14 Dec. 1802

DANIEL J. RYAN,
Author of 'A History of Ohio'; 'The Civil War Literature of Ohio'; etc.

OHIO, Army of the, in American military history, a division of the Federal army in the Civil War; organized in 1861–62 by General Buell; afterward under the command of General Rosecrans and incorporated with the Army of the Cumberland. A second department of the Ohio was formed and was also in 1865 incorporated in the Army of the Cumberland.

OHIO COMPANY, The, in American history, a western colonial enterprise known as Ohio Company the first and Ohio Company the second. (1) In 1749 George II granted to a party of wealthy Virginians a tract of land containing 500,000 acres, lying mostly to the west of the mountains and south of the Ohio River. Thomas Lee was the projector of this company, but it was later conducted by Lawrence Washington. The conditions of the grant were that 100 families should be established there and a garrison maintained. It was short-lived. (2) On 3 March 1786 at the suggestion and in the house of Rufus Putnam (q.v.) of Rutland, Mass., Putnam, Cutler, Brooks, Sargent and Cushing organized an association of 1,000 shares, each of \$1,000 in Continental certificates, or \$125 in gold. A year was allowed for subscription. Land was to be purchased from Congress, in tracts lying between the Ohio and Lake Erie. On 9 May 1787 Parsons, agent for the company, appeared before Congress and was well received. Congress granted certain lots free of charge and an enormous tract was bought at about eight or nine cents per acre in specie. Colonization was immediately begun, and slavery was prohibited. The company had much influence in shaping the ordinance for the government of the Northwest Territory. See ORDINANCE OF 1787.

OHIO FALLS CANAL. See CANALS.

OHIO NORTHERN UNIVERSITY, Ada, Ohio, a coeducational institution chartered in 1904, but existing under different names from 1871. It was originally the Northwestern Ohio Normal School, but was consolidated with the Northwestern Normal School in 1875. It came under the control of the Methodist Episcopal Church in 1898, and was reorganized, taking its present name in 1904. In 1918 its president was Dr. A. E. Smith. It had 522 students with the United States army and 1,354 attending, the staff numbering 47 members. There are 5,155 living graduates.

OHIO RIVER, one of the largest tributaries of the Mississippi. It is formed by the junction of the Allegheny (q.v.) and Monongahela (q.v.) rivers, at Pittsburgh, in the western part of Pennsylvania. The Allegheny River brings to the Ohio the waters of Chautauqua Lake, and the drainage waters from the southwestern part of the State of New York. The headwaters of the Allegheny in New York are only a few miles from Lake Erie. It is navigable 120 miles from the Ohio. The headwaters of the Monongahela have their rise in the Alleghany Mountains in West Virginia, near the source of the Potomac River. It is navigable for about 60 miles from the Ohio. The Allegheny and Monongahela are large rivers at Pittsburgh, where they blend their waters to make the new stream. Here the Ohio is 1,021 feet above sea-level, and at its confluence with the Mississippi it is 322 feet above the sea. At first the Ohio flows north by

west, the valley broadening out to a flood plain. At Beaver the river turns and flows south by west, then almost south, forming the boundary between Ohio and West Virginia. Changing its course west, northwest, southwest, it forms the boundary between Ohio and Kentucky, then the boundary between Kentucky on the south and Indiana and Illinois on the north. Along its course are a number of large curves, but it has no falls or rapids that obstruct navigation except at Louisville (q.v.), where a coral reef exists; but the rapids formed have been overcome by lateral canals. The descent here is about 22 feet in two miles. The river is now navigable for its whole remaining course, a distance of about 975 miles; but a direct line from Pittsburgh to the mouth of the river is about 614 miles. The area of the Ohio Basin is about 214,000 square miles. The average rate of flow is a little over three miles an hour. The chief tributaries are the Muskingum, Scioto and Miami in Ohio and the Wabash, which is the largest affluent from the north. The largest tributaries from the south are the Tennessee and the Cumberland. Other large streams are the Kanawha, Licking and Kentucky. The largest tributaries of the Ohio have their headwaters in the mountains, and thus they become the depositories of vast quantities of the melted snows and heavy rains of spring which cause floods in the Ohio Valley. Often great damage to property and even loss of life is caused by these floods. The difference between the high and low-water mark some seasons exceeds 60 feet, and in 1887 it was over 70 feet. In the Ohio Valley flood (March-April 1913) damage was done to 206 towns and over 400 persons lost their lives and \$180,000,000 property loss was sustained. There are times in the dry season when the water is so low at Pittsburgh and in places below, even as far as Cincinnati, that navigation is hindered or retarded. The Ohio and its tributaries have 2,300 miles of navigable waters. The coal from Pennsylvania, West Virginia and Ohio, the building stone and the grain and other farm products, the iron, steel, clay and lumber products, make a large amount of freight which is carried over the Ohio and its tributaries. The average annual amount of freight is over 15,000,000 tons. There are a number of large cities on the banks of the Ohio, some of which are Cincinnati, Louisville and Evansville.

The Ohio River has been prominent in the history of the United States. From the first it was recognized as one of the important waterways of the country. The short portages from Lake Erie to the navigable tributaries of the Ohio and the continuous waterway to the Gulf of Mexico make the river an important route for the explorer, missionary and settler. (See UNITED STATES — HISTORY: NORTHWEST TERRITORY; OHIO). Consult Bliss, 'Dr. Saugrain's Relation of his Voyage Down the Ohio River,' (in 'American Antiquarian Society Proceedings,' Worcester 1897); Hulbert, A. B., 'The Ohio River' (New York 1906); King, 'History of Ohio'; Thwaites, R. G., 'On the Storied Ohio' (Chicago 1903).

OHIO STATE ARCHÆOLOGICAL AND HISTORICAL SOCIETY was first organized at Mansfield, Ohio, in 1875 as the Archæological Society of Ohio. Subsequently

it was reorganized at Columbus and incorporated March 1885 as the Ohio State Archæological and Historical Society. Its first president was Hon. Allen G. Thurman. The headquarters are at Columbus. It has a library and very extensive archæological museum in Page Hall, Ohio State University. It is managed by a board of trustees, part of whom are appointed by the governor and part elected by the members of the society at their annual election. The society is supported with appropriations by the general assembly of the State. It publishes an annual volume of biographical, historical and archæological matter pertaining to Ohio. It conducts archæological researches each summer amid the sites and remains of the prehistoric mound builders. Its members, divided into four classes, honorary, life, corresponding and ordinary.

OHIO STATE UNIVERSITY, The, opened at Columbus in 1873. In 1866 an act passed the Ohio legislature providing for the establishment of the Ohio Agricultural and Mechanical College, in accordance with the provisions of the Federal land grant of 1862. But nothing further was done until 1870, when a second law was passed by which the college was established at Columbus. It was reorganized in 1878 and the name changed to the Ohio State University. The present organization includes a graduate school and 11 colleges: (1) the Graduate School administers all the graduate work offered in the university, leading to the following degrees in course: M.A., M.Sc., Ph.D., C.E., M.E., E.E., E.M., Cer.E., Chem.E., and M.Arch.; (2) the college of agriculture offers four-year curricula in agriculture, horticulture, forestry, landscape architecture, applied entomology and home economics, leading to the degree B.Sc.; (3) the college of arts, philosophy and science offers courses in languages, sciences and humanities, leading to the degrees B.A. and B.Sc.; (4) the college of commerce and journalism, offering two-year curricula, based upon two years of college training in accounting, banking and finance, charity organization, insurance, journalism, manufactures, marketing — domestic and foreign, public service, social service and transportation, leading to the degree B.Sc.; (5) the college of dentistry, a four-year curriculum leading to the degree D.D.S.; (6) the college of education, offering four-year curricula in general education, art, home economics, manual training and agricultural education, leading to the degree B.Sc. in Edu.; (7) the college of engineering, offering four-year curricula in architectural, ceramic, chemical, civil, electrical, general, mechanical and mine engineering and architecture, leading to a bachelor degree; (8) the college of homœopathic medicine, offering a four-year curriculum based upon two years of college training and leading to the degree M.D.; (9) the college of law, offering a three-year curriculum, based upon two years of college training and leading to the degrees J.D. and LL.B.; (10) the college of medicine, offering a four-year curriculum based upon two years of college training and leading to the degree M.D.; (11) the college of pharmacy, offering a four-year curriculum, leading to the degree B.Sc. in Pharmacy; (12) the college of veterinary medicine, offering a four-year curriculum, leading to the

degree D.V.M. There are also shorter courses offered in agriculture, horticulture, dairying, poultry husbandry, clayworking, industrial arts and mining. The instruction in agriculture, engineering and science has always been a prominent feature of the university's work; and its laboratories are especially well equipped. A lake laboratory for biological study is maintained at Sandusky. Military drill is a part of the curriculum for men. Women are admitted to all the departments. The governing body is a board of trustees, appointed by the governor with the approval of the State senate for seven years. The campus and farm contain 585 acres, of which 475 are set apart for the work in agriculture and horticulture. The income is derived from the land grant of 1862, from the annual Federal appropriation and from a permanent annual grant from the State, established in 1891 and doubled in 1896. In 1922-23 the students enrolled for the regular session numbered 7,914 and the faculty 658.

OHIO UNIVERSITY, Athens, Ohio, the pioneer higher institution of learning in the "Old Northwest." Ohio University is the oldest higher institution of learning in that part of the United States known as the "Old Northwest." Before Ohio was admitted to Statehood the Territorial legislature, in session at Chillicothe, made provision "that there shall be a university instituted and established in the town of Athens." This action bears date of 9 Jan. 1802. The institution to be "instituted and established" was named the "American Western University." Two years after the passage of the act—Ohio having in the meantime been admitted into the Union—the State legislature re-enacted the provisions of the Territorial Act, with but few changes, by another act dated 18 Feb. 1804. This latter act, which gave the name "Ohio University" to the institution to be established, has ever been regarded as the charter of Ohio University. The institution thus provided for was opened to students in the spring of 1808, when Rev. Jacob Lindley, a Princeton graduate, was placed in charge.

The first graduates, Thomas Ewing and John Hunter, received their diplomas in 1815. The whole number of degree graduates, of baccalaureate rank, in the history of the university is men, 905; women, 314; total, 1,219. The total number of different students enrolled increased from 405 in 1901 to 4,962 in 1916.

A more intelligent statement of an approximate enrolment of different students is as follows:

College of Liberal Arts.....	620
State Normal College.....	1,941
Summer School (total 2,290) counting only those not enrolled elsewhere.....	1,542
Extension Classes (total 1,185) counting only those not enrolled elsewhere.....	859
Total.....	4,962

The university buildings are 15 in number, not including the president's home, the heating plant, the greenhouse and 10 buildings used as dormitory quarters for women students. Conservative valuation of the property of the university is as follows: grounds, \$541,562; buildings, \$976,000; equipments, \$211,100; total, \$1,728,662. The financial support of the university is derived from three sources, namely, the mill-tax, special appropriations and local receipts from incidental fees, rents and interest

on permanent funds forming a part of the irreducible debt of the State of Ohio. Receipts from all these sources in 1916 amounted to \$319,718.02. Salary payments for the fiscal year ended 30 June 1916 amounted to \$166,663, of which amount the sum of \$136,211.34 was for teaching service exclusively. Expenditures for the year made a total of \$300,533.86.

One degree is given in the college of liberal arts—A.B. The degree of B.S. in Education is given those who complete the four-year courses in the State Normal College. To receive either of these degrees the student must have a credit of not less than 120 semester hours based upon at least 15 units of secondary work. Each semester covers a period of 19 weeks and each recitation period represents 55 minutes of actual class-room work. The field of instruction covered is shown by the following classification of colleges and departments: college of liberal arts; the State normal college; the college of music; the department of public speaking; the school of commerce; the department of physics and electrical engineering; the department of mathematics and civil engineering, and the departments of drawing and painting.

In the State Normal College the following courses are offered: 1, course for teachers of rural schools; 2, a two-year course in elementary education; 3, a four-year course in secondary education; 4, a four-year course in supervision for principals and superintendents; 5, a one-year course for college graduates; 6, a two-year course in the kindergarten school; 7, a two-year course in school agriculture; 8, a two-year course in manual training; 9, a two-year course in household arts; 10, a two-year course in public-school music; 11, a three-year course in public-school drawing; 12, a two-year course in physical education. All courses named lead to a diploma; courses 3, 4 and 5 to a diploma with the degree of bachelor of science in education. The library contains over 46,000 volumes. The faculty numbers 88.

OHIO WESLEYAN UNIVERSITY, Delaware, Ohio, was founded under the patronage of the Methodist Episcopal Church in 1841, when the original property was acquired and an academy opened. The charter was granted in 1842. In 1844 the College of Liberal Arts began its work. In 1877 the Ohio Wesleyan Female College, an independent institution, established in Delaware in 1853, was incorporated in the university, its students were admitted to university classes and its graduates to *ad eundem* degrees. Since this time the university has been coeducational. In 1896, the Cleveland College of Physicians and Surgeons, originally established in 1863, became an integral part of the institution and its subsequent graduates were admitted to the degree of doctor of medicine in the university. This school was combined with the medical department of Western Reserve University in June 1910.

The university has maintained, since its foundation, college preparatory classes, now organized as the academy; and maintains, in the conservatory, a school of music and a school of fine arts, both established in 1877. A school of oratory, established in 1894, is now organized as a department of the college. The

school of business, established in 1895 and for several years organized as a part of the academy, was discontinued in June 1912. The graduates of each of these schools, upon the completion of a prescribed course of study, are granted certificates under the seal of the university, but are not thereby admitted to academic degrees. The total value of grounds, buildings and endowments is \$2,400,000 and the annual income from endowments and fees, \$407,523. The library contains 91,013 volumes. The total number of students enrolled for a recent academic year was 1,711, of whom 1,610 were in the college. The college faculty numbered 114 including the faculties of all the schools. The aim of the college is to maintain a genuine curriculum of liberal arts that its graduates may be prepared, under high ideals of scholarship and conduct, for successful professional or technical study elsewhere, or for the discharge of all their obligations as citizens. It confers the degrees of bachelor of arts and bachelor of science. The total number of graduates, including the class of 1922, who have received baccalaureate degrees is about 6,000.

OHM, ðm, Georg Simon, German physicist: b. Erlangen, 16 March 1787; d. Munich, 7 July 1854. He was educated at the University of Erlangen. In 1817 he became a teacher at the gymnasium in Cologne, and in 1826 at Berlin. From 1833 to 1849 he was director of the polytechnic school at Nuremberg, and in 1849 went to Munich as professor of physics at the university. His researches were chiefly concerned with galvanic currents and he formulated the law which is known as Ohm's law; that the current is directly proportional to the electromotive force and inversely proportional to the resistance. This law was first stated in his 'Bestimmung des Gesetzes, nach welchem die Metalle die Kontaktelektrizität leiten' (1826), and was further developed and proved in his 'Die galvanische Kette mathematisch bearbeitet' (1827); in English 'The Galvanic Circuit Mathematically Investigated' (1891). He also wrote 'Beiträge zur Molekularphysik' (1849), and 'Grandzüge der Physik' (1854). His collected writings were published by Lommel in 1892. His name was given to the practical unit of electrical resistance in 1881. Consult Mann, 'Georg Simon Ohm' (Leipzig 1892); Von Lommel, Eugen, 'Scientific Work of Georg Simon Ohm' (Washington 1893, trans. by W. Hallock).

OHM, the practical unit of electrical resistance, adopted in 1881 by the International Congress of Electricians at Paris, the centimeter-gram-second unit formerly in use having proved too minute for convenient reckoning. The ohm, named after the German physicist Ohm (q.v.), equals 1,000,000,000 (10^9) C. G. S. electro-magnetic units of resistance; a michrom is a resistance of one millionth $\frac{1}{10^6}$ of the ohm; and the megohm is a measure 1,000,000 (10^6) times the ohm. The ohm may be independently defined as the electrical resistance to an unvarying current offered by a uniform column of mercury at 0° C., 106.3 centimeters in length and one square millimeter in cross-section.

OHMANN-DUMESNIL, Amant Henry, American dermatologist: b. Dubuque, Iowa, 30 Sept. 1857. He was graduated from the Mis-

souri State University in 1877 and from the Saint Louis Medical College, Washington University, in 1880, and has since made dermatology his specialty. He was professor of dermatology in the College for Medical Practitioners 1881; in the College of Physicians and Surgeons 1882; and in Marion Sims College of Medicine, 1895-97. He was also editor of the *Weekly Medical Review*; editor of the *Saint Louis Medical and Surgical Journal* and *Atlas of Dermatology*, and later editor and proprietor of the *Saint Louis Medical and Surgical Journal* and has published 'Hand Book of Dermatology' (1898); 'History of Syphilis' (3 vols., 1899).

OHM'S LAW, a fundamental principle in the mathematical theory of electricity, discovered in the early part of the 19th century by Dr. Georg Simon Ohm, a professor of physics at Cologne. It was first published in 1826. The law may be stated in the following manner: In any closed electrical circuit of resistance R, the current C, produced by an electromotive force E acting around the circuit, is given by the formula $C = E/R$; C being measured in amperes, E in volts and R in ohms. Some authorities regard this simple equation as a sort of truism, pointing out that the ampere is, by definition, the current generated by one volt in a circuit whose resistance is one ohm. Ohm's law is much more than a truism, however, because it states not only that one volt generates a current of one ampere in a circuit whose resistance is one ohm, but also that P volts, acting in a circuit whose resistance is Q ohms, generate a current of P/Q amperes. Ohm's law was first given for the case in which a constant electromotive force acts in a simple linear circuit, but it may readily be generalized so as to apply to branched circuits and to circuits in which the electromotive force is variable. See ELECTRICITY; RESISTANCE, ELECTRICAL; UNITS OF MEASUREMENT.

OHNET, Georges, French novelist: b. Paris, 1848; d. there, May 1918. He at first became a lawyer, but soon turned to journalism and edited, in the early 70's, *Le Pays* and the *Constitutionnel*. But it was in the melodramatic novel that his literary skill was best displayed. He wrote an enormous quantity of articles, novels and plays, and was writing on the war until a few days before his death. His masterpiece was the novel 'Le Maître de Forges' (1882), known to English readers as 'The Ironmaster.' A dramatized version met with great success. He was a strong admirer of George Sand and modeled his work on her later style, after the force of the Romantic movement had spent itself. Some of Ohnet's novels brought him more profit and notoriety than critical approbation. They form a series bearing the generic title of 'Battles of Life.'

OIL. There exists in nature a great number of substances that are more or less fluid at ordinary temperatures, that are insoluble in water, that take fire on application of flame, and, while not very closely related, are grouped together under the name "Oils." Some are ready formed, as petroleum; others are easily obtained by subjecting the crushed seeds of plants to pressure or by extracting the meal with volatile solvents, as linseed and rapeseed oil; or by the aid of heat and pressure as lard

oil; and others by distillation as oil of peppermint. Some are sparingly soluble in alcohol, others freely so; but all except castor oil are soluble in ether, petroleum of various grades, chloroform and carbon-disulphide and in each other. Because of certain similarities in characteristics they are classified under the three headings of essential oils, fixed oils and petroleum.

Petroleum.—As is indicated by its name, petroleum is obtained from the rocky structure of the earth. (See PETROLEUM). An older classification included the petroleum with the essential oils, because of the readiness with which they are distilled.

Fixed or Fatty Oils.—These are a section of the bodies described under the general heading of "Oils, Fats and Waxes" and are derived from both animal and vegetable sources. They cannot be distilled, as the petroleum, ordinarily, are without decomposition; they leave permanent, translucent grease spots on paper; they are, therefore, called "Fixed Oils." They vary in specific gravity from .875 to .960. Fixed oils are fluid at ordinary temperatures, differing in this respect from the fats which are more or less solid. Both oils and fats are mixtures composed chiefly of olein, stearin and palmitin, but those in which olein predominates are known as oils. Olein is that portion of fixed oils that is fluid at ordinary temperature, while the crystalline portion consists of stearin and palmitin. They differ chemically, but for practical purposes this distinction is sufficiently broad. Considered chemically, the fatty oils and solid fats are neutral glycerides of fatty acids, whereas waxes are esters formed by the union of fatty acids with alcohols not belonging to the glycerol series. When treated with an alkaline solution the fixed oils are saponified with the formation of glycerol. There have been many classifications of the fixed oils based on various characteristics, but the most convenient one for practical purposes appears to Lewkowitch to be that of arranging them according to the magnitude of the iodine value. This principle leads to a natural subdivision into liquid fats (oils) and solid fats (fats), the former being differentiated from the latter by their considerably higher iodine values. This value indicates the percentage of iodine chloride absorbed by a fat or wax, expressed in terms of iodine. The iodine value is obtained by treating the oils in a prescribed manner with iodine chloride, the percentage absorbed being a measure of the proportion of the unsaturated bodies present. The knowledge of this value is of great service in the selection of proper fixed oils, for definite purposes. Those consisting largely of unsaturated bodies, as, for example, linseed and poppy seed, are useful in painting. Naturally thin, they can carry large proportions of pigment giving great covering power. On exposure to air the unsaturated portions become saturated, or "dry" as commonly stated, to a hard surface. For the same reason, linseed oil can not be used for lubrication. On the other hand, olive oil, which has a low iodine number because it contains less unsaturated bodies, can be used for lubrication, but is entirely unsuited for painting purposes. There is a close relationship between the iodine value and the capacity to absorb oxygen so that

arranging the vegetable oils according to the magnitude of this value gives a classification as to drying power.

Cholesterol has long been recognized as one of the crystalline constituents, chemically an alcohol, of fats and fatty oils, of animal origin. Other similar bodies have been isolated and these are all now classified as zoosterols. Vegetable fats and fatty oils are characterized by the presence of corresponding alcohols to which the name phytosterols has been given. Recent researches have served to show the chemical difference between the two series and their derivatives and naturally lead to a second guiding principle in the subdivision of the glycerides. Arranging the fatty or fixed oils and solid fats according to these two principles, we obtain the following subdivisions:

Liquid Fats and Fatty Oils:

- A. Vegetable oils
 - 1. Drying oils
 - 2. Semi-drying oils
 - 3. Non-drying oils
- B. Animal oils
 - 1. Marine animal oils
 - a. Fish oils
 - b. Liver oils
 - c. Blubber oils
 - 2. Terrestrial animal oils

Solid Fats:

- A. Vegetable fats
- B. Animal fats
 - 1. Body fats
 - a. Drying fats
 - b. Semi-drying fats
 - c. Non-drying fats
 - 2. Milk fats,

LIQUID FATS AND FATTY OILS.

A. Vegetable Oils. 1. *Drying Oils.*—The drying oils include linseed, Chinese tung oil, poppy seed oil and several of the less familiar ones which are characterized, when exposed to air, by changing to first, a tacky and eventually a smooth varnish-like surface. Because of this fact linseed oil has long been an important article of consumption as a vehicle both for carrying lead and fine paints for practical house painting and when mixed with pigments, for decorative work. Its source is the seeds of the flax plant. Chinese tung oil, also known as Chinese wood oil, Japanese wood oil and as simply wood oil, was first mentioned in about 1735 as an adulterant of Chinese lacquer. It is obtained from the seeds of *Aleurites cordata*, a tree indigenous to China. The fruit forms a nut, in which three to five seeds having a hard shell and an oleaginous kernel are enclosed; hence in China the oil is frequently termed "nut oil." The seeds are roasted in a flat dish over a naked fire, then broken between stones and the flesh pressed in a crudely-made wooden press. The kernels contain about 53 per cent of oil, but the practical yield is only 40 to 41 per cent. The oil cake, from which the oil has been expressed, is poisonous and is only used as a fertilizer or burned for the production of lamp black. One of the peculiar characteristics of this oil is that it gelatinizes on heating. A portion raised to its fire test and allowed to cool cannot be poured from the containing vessel.

2. *Semi-Drying Oils.*—The semi-drying oils are frequently divided into first, the cottonseed oil group, which includes, beside the one giving the name, maize (corn) oil, sesame, soja bean and several other lesser-known oils;

and second, the rape oil group which also includes the oil derived from the seeds of rampion, black, white and Indian mustard. The oils of this group, in the past, have been used in large quantities for the lubrication of machinery and for illuminating purposes, but are now almost entirely replaced by pure mineral and compounds of mineral and fixed oils, respectively. The highly refined rapeseed oil expressed from seeds grown on their own farms, is prepared by the peoples of European nations for domestic purposes and also for burning in sanctuary lamps.

3. *Non-Drying Oils*.—The non-drying oils are best known through olive, arachis and castor oil. The olive oil obtained from the flesh of barely ripe olives is of better quality than that from fully matured or over-ripe fruit. Fine grades are made from hand-picked fruits from which the kernels have been removed. Exceptionally fine qualities are prepared by peeling hand-picked fruit and pressing lightly after carefully removing the kernels. The pressed pulp is worked over in various ways for the production of the lower grades of edible oils and those for lubrication and soap-making. Castor oil is obtained from the seeds of *Ricinus communis*. The most important sources are East India, Java, the Mediterranean countries, Mexico and the United States. The medicinal oil is produced by expression in the cold. The oil from the presses is received in well-tinned vessels where it is allowed to settle, following which it is refined by heating in tinned pans over water kept at its boiling point to coagulate the albumen. When this is accomplished it is cooled and strained through cotton flannel into cans in which it is brought to market as "cold drawn" oil. The oil cake is afterward heated and pressed for lower grade oils used for mechanical purposes. Castor differs from all other fixed oils in its solubility in alcohol and in its being nearly insoluble in the petroleum. Arachis, peanut oil, is obtained by expression from the ordinary peanut, *Arachis hypogaea*. Under the newer processes it is being converted into a salad oil, water-white in color and entirely free from the odor of peanuts.

B. *Animal Oils*.—The two divisions of the animal oils represent practically also the drying and non-drying classes. As with the vegetable oils there also exist those derived from the animal kingdom that are intermediate in position between the drying and non-drying oils, as indicated by their iodine number. These, however, are the little-known oils and of small commercial value.

1. *Marine Animal Oils*.—a. *Fish Oils*.—The fish oils are obtained from pressing the entire fish—and include the menhaden, herring, sardine, sprat and portions of the salmon that are not usable for food. The catch of the menhaden, for example, which is largely the source of the fish oils expressed in the eastern United States, is in enormous quantities, especially off the coast of New Jersey from about May until November. Some seasons as much as 400,000 tons have been caught and pressed. The United States Fish Commission reported in 1912 a production of 6,651,203 gallons of menhaden oil which, together with the scrap used for fertilizer, amounted in value to \$3,690,155. This

oil is graded under different qualities, the best being that obtained from fresh fish. The oils are clarified by filtering through fullers' earth and then are allowed to rest for some time in tanks, cooled either naturally or artificially, to separate the stearin and impurities from the olein. The more fluid part of the oil is removed by decantation and the stearin, which settles out, is afterward pressed for the removal of a larger percentage of the oil. Both the oil and stearin have a large use in the manufacture of leather.

b. *Liver Oils*.—These are obtained, as indicated by the name, from the livers of the larger fish, the best known being the cod, haddock, skate and dogfish. They contain notable amounts of cholesterol and other unsaponifiable substances. Genuine cod liver oil is obtained from the liver of the *Gadus morrhua*. At certain times every year enormous shoals of cod frequent the coast of the Northern seas, chiefly the coasts of Norway, Scotland, the East coast of the United States and Canada, the coast of Newfoundland and also the West coast of the United States and the coasts of Japan and Siberia. For many years the best medicinal cod was obtained from Lofotes, Norway, at which point the cod appears in February, the fishing season lasting from that month until April. Later in the year they appear at Finmarken, but here they are in an immature condition and hence do not yield as much oil or of as good quality as that obtained from the fish caught off the Lofotes coast. Another difficulty is that the cod frequenting the Finmarken coast are accompanied by other fish, whose livers naturally become mixed with those of the cod and do not add to its value. The main purpose of catching the cod is its value as food and it seems probable that the usefulness of the oil was an accidental discovery. The former practice on shipboard was to place the livers freshly taken from the fish in barrels, where they were allowed to decompose. This ruptured the oil-containing cells and the accumulated oil in the barrels was tapped off and purified for medicinal purposes. Because of contamination, as well as the method of production, its odor and taste were objectionable. In the best equipped establishments at present, the method followed is to place the fresh livers in tin-lined vessels provided with open steam coils, almost immediately after they have been taken from the fish; washed and sorted—all livers showing stains being discarded. Low pressure steam is then blown into the livers and the oil exudes almost immediately. This method is also being followed in Newfoundland, so that the product now being made there is not considered inferior to the Norwegian medicinal oil. The crude medicinal cod liver oil is filtered to free it from liver tissue and bleached by treatment with fullers' earth or by exposure in closed glass vessels by the action of the sunlight. Medicinal oil so prepared deposits stearin at a low temperature and such oil is termed "Congealing Oil." This is rendered "non-congealing" by cooling it down to a temperature below Zero° C and pressing or decanting the stearin free oil. The livers unsuited for the preparation of medicinal oil, either from disease or decomposition due to keeping them too long, are steamed and pressed

for a grade of commercial oil used in finishing leathers. That cod liver oil has a therapeutic value seems to have been definitely proven, but on just what constituent this depends investigators do not agree.

c. Blubber Oils.—Among the blubber oils, the third group of the marine animal oils, are several of varying composition, which are thus described by Lewkowitch: "Seal oil, whale oil, turtle oil and dugong oil consist almost wholly of glycerides; dolphin oil, porpoise oil and brown fish oil contain notable amounts of spermaceti forming as it were intermediate members between true fatty oils and liquid waxes. . . ." "The last three members of this group—dolphin, porpoise and brown fish oil—occupy an exceptional position on account of their containing considerable proportions of glycerides and volatile acids. In this respect turtle and dugong oils form intermediate links between these oils on the one hand and seal and whale oils on the other." The "trying" out of the blubber oils is now mostly done on shore. The blubber is stripped clean from flesh, cut into strips which are thrown into chopping machines and the shredded mass immediately delivered into melting pans and boiled with steam. The first oil off is of the best quality. If desirable to prepare an oil free from stearin, that work is accomplished in the same way as described under cod liver oil.

Sperm is omitted from this classification because while fluid, it is chemically a wax and not an oil. It is unique in many respects. Nearly all the other fixed oils have a specific gravity heavier than .915, while sperm oil has a specific gravity of .880. Its flash test is practically as high as any of the fixed oils, but its viscosity is much lower than any other fixed oil. Notwithstanding these characteristics, sperm oil in the past has been used for lubrication for nearly all kinds of machinery, ranging from ring spindles to steam cylinders. There are two recognized varieties—the sperm obtained from the head cavities and from the blubber of the sperm whale, or cachalot (*Physeter, macrocephalus*) and Arctic sperm oil obtained chiefly from the bottle-nose whale (*Hyperoodon Rostratus*). The oils from the two portions of the body differ considerably in appearance and if rendered on shipboard are kept separate, but when received at the refineries, they are generally mixed in their natural proportions of one-third head oil and two-thirds body oil. This mixture is chilled and pressed for the separation of the spermaceti which remains in the press cloths, the oil, freed from wax passing through. The head or brain oil is clear and limpid when first removed, but after a short time thickens and hardens through the chilling of the spermaceti. The body oil is a light straw color. Sperm whales yield varying amounts from five to 145 barrels of the crude material.

2. Terrestrial Animal Oils.—The liquid fats from terrestrial animals are practically all non-drying. A few of scientific interest, not obtained in commercial quantities, judged by their iodine value alone might be classed with the semi-drying oils. Many of the oils in this section come on the market only after they have been pressed for removal of a portion of the stearin and palmitin with which they are mixed

in the tissues. Lard oil, for example, is obtained from the fats from the visceral cavity of the hog, the best grade being rendered within 24 hours after removal. It is allowed to granulate at a temperature of approximately 55° F., after which it is pressed. The oil obtained is largely used for illuminating purposes, though a portion is required for the "enfleurage" process in obtaining essential oils (see PERFUMES AND PERFUMERY), while the combined stearin and palmitin are mixed with the softer grades of lard to stiffen it for summer trade. The grades rendered from the less desirable fats of the hog in the past have found a ready market for use in cutting threads on metals, but in automatic machine work they are now being superseded by the specially prepared mineral oils.

Other familiar oils from terrestrial animals are neatsfoot and tallow oil. Genuine neatsfoot oil is obtained from the feet of cattle. The hoofs are washed and scraped to remove hair and impurities, are sawed or split to better expose the fatty matter and kept simmering with water in steam-jacketed pans for eight to 10 hours. The oil rises to the surface from which it is frequently skimmed and is transferred to heated tanks in which it is allowed to settle to separate it from water and other suspended matter. On chilling the stearin settles to the bottom of the container; the clear oil is decanted and if the process has been well-carried out, may have a cold test of 20° F. Neatsfoot oil should be pale yellow in color, have a bland taste and a characteristic odor. The demand for this oil in the leather industries has brought out inferior grades, adulterations and substitutes. Some of the latter, however, are quite as valuable in finishing leather as genuine neatsfoot. The products obtained from the rough fats taken from cattle come to the market both as oils and fats and because of their importance in both conditions, will be taken as the types for the connecting links between the oils and the fats. The methods of separating the fats are of sufficient interest to warrant describing them in detail. In the large slaughter houses the fat is immediately removed from around the kidneys and bowels of the slain animal; is carefully freed from all inferior fatty matter and taken at once to the oleomargarine factory where it is sorted, washed thoroughly with warm water and placed in cool rooms to dry and harden. It is "rendered" by heating in tin-lined jacketed kettles to a temperature of 109° F., the liquefied portion rising to the top of the kettle from which it is decanted. The liquid is cooled in shallow tin-lined trays at such a temperature that the stearin will crystallize or "granulate." When finally solidified the cake is cut into small pieces, each one wrapped in a press cloth of canvas and a quantity of these submitted to pressure in an hydraulic press. The oleo oil oozes through the canvas but the oleo stearin remains inside. The oleo oil is the chief ingredient of oleomargarine (q.v.) and the oleo stearin is used in the preparation of "lard substitutes" and other food products.

The fat taken from all other portions of the carcass are usually rendered together. The simple process calls for a steam jacketed lead-lined kettle supplied with open steam coils, having a close fitting cover to which a pipe is

attached for conveying the odorous vapors to a stack and facilities for charging and discharging. The rough fat is cut up, put into the tank, hot water run in, steam turned on and continued until all the fat obtainable by heat alone has risen to the surface. The melted fat is removed, a small percentage of dilute sulphuric acid added and steam again turned on. The acid breaks down the animal tissues and releases oil from the cells which heat alone could not. In smaller places these two grades are mixed in melted condition, purified by settling over hot water, run into molds allowed to cool and solidify and sold as cake tallow. The sweetness and purity of the product depends quite as much on the stock used as on the care taken in rendering and purifying. In the larger institutions the rendered fat is allowed to cool at granulating temperature, after which it is placed in canvas bags and submitted to pressure. The oil pressed through the canvas is mostly olein and is the tallow oil of commerce. The portion remaining inside the bags has a higher melting point than the tallow because consisting chiefly of stearin and palmitin, and is marketed as tallow stearin.

Essential Oils.—The greater proportion of the essential oils are found in nature ready formed. The characteristic odors of plants are due in most cases to the presence of one or more of these bodies. Not all now being produced, however, are of vegetable origin, large quantities being made synthetically in laboratories to the identical chemical structure of the natural oil. The essential oils differ from the fixed or fatty oils in that they are volatile, leaving at most only a trace of residue, hence they do not produce a permanent grease spot on paper. They are usually of very complex composition, and different specimens from the same botanical source often exhibit considerable variations in the proportions of their constituents. The following by Mr. Ernest J. Parry, taken from the last edition of Allen's 'Analysis,' gives important information as to their composition: "The only satisfactory classification of Essential oils is according to their botanical origin. The alternative method, adopted by many French chemists, is to classify them according to their chemical relationships. But this at once raises a serious difficulty. Many oils owe their chief characteristics to at least two different substances. For example, citronella oil contains a large amount of both geraniol and of citronella. If we adopt a chemical classification, are we to place this oil with otto of roses, which contains a very large amount of geraniol, or with a lemon-grass oil, which consists chiefly of the aldehyde citral. Both German and French chemists prefer a botanical classification, and this will be found to have considerable advantages over a chemical one. The greater part of the Essential oils will be found to owe their principal characteristics to one or more of the following groups of compounds: (1) Terpenes, hydrocarbons of the formula $C_{10}H_{16}$: in many of these cases 90 per cent of terpenes are present, but they are seldom the most useful portion of the oil, which frequently depends entirely for its value on the remaining constituents, e.g., lemon oil, orange oil; (2) Sesquiterpenes, hydrocarbons

of the formula $C_{15}H_{24}$: cedar-wood oil and patchouli oil are type of this class; (3) Open chain alcohols and their corresponding aldehydes: such are the so-called Indian grass oils (citronella, lemon-grass and Indian geranium oils); (4) Aromatic alcohols of the camphor series and their corresponding ketones, such as peppermint, thuja and pennyroyal oils; (5) Aromatic alcohols of the benzene series and their corresponding aldehydes and ketones, such as bitter-almond oil, caraway oil and cinnamon oil; (6) Sesquiterpene alcohols, such as sandalwood oil. (7) Phenols and their derivatives, such as clove and aniseed oils. (8) Esters of any of the above-mentioned alcohols, such as lavender and bergamot oil, wintergreen oil. (9) Sulphur compounds, such as garlic oil. There are a few oils which do not come under any of these heads, but they are not very numerous."

The essential oils of plants are usually liquid at ordinary temperatures, but many of them deposit solid bodies called stearoptenes by cooling, e.g., camphor and the paraffin hydrocarbons of rose oil.

Manufacture of Essential Oils.—They are obtained by the following methods: (A) By pressure, as the oils of lemon, laurel and bergamot. (B) By distillation with water, or by passing a current of steam through the matter to be extracted. It has been found that the steam distillation of some essential oils is not the best method of manufacture, because certain bodies may be changed chemically by this operation and impart an odor not present in the plant itself. (C) By fermentation and distillation, as the essential oils of mustard and bitter almonds. After all the fixed oil has been extracted from the mustard seed meal, water is added. In its presence, a fermentation is started which results in the formation of essential oil which is then recovered by distillation with water. (D) By solution in a fixed oil devoid of odor, such as olive oil or lard—the "enfleurage" process. The "enfleurage" process, for this reason, is considerably better in that the essential oils are not exposed to heat. A layer of fat or oil is spread on a plate of glass, the fresh flowers are sprinkled on it and after the fat has absorbed the odor they are replaced by more flowers, and this process repeated until the fat is saturated. The fat is then removed and is washed with alcohol which extracts the odorous substances that have been absorbed from the flowers. (E) With volatile solvents. There are objections to the use of volatile solvents such as petroleum ether, carbon-tetrachlorid, chloroform and others, because they also dissolve resinous bodies that are detrimental to the true odors of the plants. (F) By synthesis. Industrial chemists have made considerable progress in duplicating odors synthetically. Not only are natural odors produced but other chemicals having delightful odors not yet discovered in nature have been made, and are now available for the use of the manufacturer of perfumes. The synthetic materials of to-day are successfully utilized in goods of the highest grade and many odor and flavor effects would be impossible without them. Because of the large number of chemical bodies found in ylang-ylang, an essential oil obtained from the flowers of a tree (*Canarium odora-*

turn), and that has long been a valuable product from the Philippines, a full description of it in an article by Mr. Alois von Isakovics in Rogers and Aubert's 'Industrial Chemistry' will be quoted:

"The distilled oil is a very complex body which differs considerably from year to year and according to the method of production; in fact, ylang and cananga, a cheaper oil, are derived from the same tree. The best ylang ylang oil consists of the first portion of the steam distillate. It contains a larger proportion of esters and is a fine example of a complex natural product. It contains benzyl alcohol, benzyl acetate, benzyl benzoate, benzyl salicylate, methyl anthranilate, methyl benzoate, methyl salicylate, geraniol, geraniol acetate, linalool, linalyl acetate, eugenol, iso-eugenol, methyl eugenol and methyl iso-eugenol. This list, while long, is by no means complete, as a number of allied bodies, especially other esters, are also present. Even all these together will not give the right odor, until the characteristic constituent is added which converts the product into ylang ylang. This body is the methyl ether of para-cresol, which is enormously powerful, and therefore must be used with great care. Traces of para-cresol and of guaiacol ethers are also present in the oil."

OIL CITY, Pa., city in Venango County, at the junction of Oil Creek and the Allegheny River, and on the Pennsylvania, the Lake Shore and Michigan Southern and the Erie railways, about 130 miles north by east of Pittsburgh. It was settled about 1825, but was only a small place, with but few local manufacturing, until the oil wells of the vicinity were developed in 1860. It was incorporated as a borough in 1863 and chartered as a city in 1874. A terrible catastrophe occurred on 5 June 1892, when burning oil came down Oil Creek from Titusville, a distance of 18 miles, and swept over the city. More than 100 persons were killed and property to the amount of about \$1,000,000 was destroyed. The city is in the midst of the celebrated oil fields of Pennsylvania and many of its industries are connected with the marketing of petroleum. Some of the prominent buildings are the Oil Exchange, the Standard Oil Company office buildings, the city hospital, church and school buildings and several building blocks. The educational institutions are the public and parish schools and the Carnegie Free Library. The government is vested in a mayor, who holds office for four years, and a council of four members, elected every two years. The school board, assessors, treasurer and comptroller are elected by the people. The city owns and operates the waterworks. Pop. (1920) 21,274.

OIL CLOTH. See FLOOR-CLOTH.

OIL ENGINE. See INTERNAL COMBUSTION ENGINE.

OIL-FISH, the colloquial name of several fishes of the blenny family (*Comephorus baikalensis*) notable for yielding oil, as the men-

haden (q.v.) of the eastern United States. Specifically, the Russian golomynka (q.v.). The specific oil-fish which has supplied the term now current in the United States for several oil-yielding fish, is found only in Lake Baikal (q.v.). It is without scales, is about a foot long and is very soft and full of oil.

OIL FUEL. See OIL; PETROLEUM.

OIL GAS. See OIL.

OIL OF MUSTARD, a volatile, pungent, colorless and irritating oil formed in mustard by fermentation when it is wet. It is chemically known as allyl isothiocyanate C^3H^5NCS . The seeds of the black mustard contain a bland fixed oil from which volatile oil is produced by the action of a soluble ferment upon the potassium salt of myronic acid in the presence of water. Oil of mustard blisters the skin. Pure oil boils at $151^{\circ} C$. The term "mustard oils" is commonly applied to organic isothiocyanates in general.

OIL PAINTING, a method of painting in which the pigments used are ground in linseed oil, made from the seed of the flax plant, or in poppy oil; in many respects the most valuable of the various processes at the command of the artist who works in color. Apparently unknown to the ancients, and but little used by the earlier painters of the Renaissance in Italy, it has gradually come into wider use in succeeding schools of art, and at the present day has very largely superseded the older methods of tempera, encaustic and fresco, even for monumental mural paintings. In the important art of scene painting the use of distemper still prevails, for various reasons of practical convenience. The technical disadvantages under which the artist painter labors are probably reduced to a minimum by the use of oil colors, but they are by no means entirely removed. The oil itself is a yellow vehicle, and has a tendency to cause the colors both to yellow and darken with age; the pigments—even with all the science of modern chemistry applied to their fabrication—are frequently unreliable, being affected by time, by exposure to the atmosphere, smoke, gas, etc., by being mixed with each other, or even by contact with the steel of the palette knife, and, many of them, having a tendency to become useless by drying in their tubes. Paintings executed in this medium, liable to deterioration through all these causes, are also frequently injured by unskilful or careless technical methods—cracking when the glazing or over-painting has been applied before the first painting was thoroughly dry, or because of the use of a medium, a varnish or a dryer, which does not dry nearly simultaneously with the pigments. Many of the paintings of the modern French school, executed in the highest period of the contemporary art, and by the recognized masters of the school, have cracked within twenty-five years of their execution. The use of bitumen—a great temptation to many painters because of its luminous, warm, dark tones—very frequently causes the painting to crack, as notably in the works of Munkacsy (q.v.). To prevent the yellowing of the oil vehicle it is usually thinned with turpentine, or is replaced in the painter's palette cups by a mixture of Siccative de Harlem and turpentine, or turpentine alone, or refined kerosene, or even by some of

the retouching varnishes. The use of an absorbent ground to paint upon also lessens this danger (while diminishing very considerably the lustre and beauty of the colors); Puvis de Chavannes (q.v.) used the common oil colors on a canvas prepared with plaster. Want of sunlight also causes oil paintings to yellow, and they can be partially restored by exposure to that light. Zinc white is much the safest white to use with oil. Oil painting cannot be used directly on a plaster wall because of the combination of the caustic lime with the oil, thereby forming a soap which destroys the durable qualities of the pigments and causes them to redden or yellow. The modern mural painters adopt the safer method of painting their pictures on canvas, which is then fastened to the wall with white lead. This method has the advantage of dispensing very largely with the disagreeable necessity of working on scaffoldings, frequently at a great height from the ground, as the old painters did. In general, heavy impasto, or the application of much color by many repaintings and scumbling or glazing of thin color over another underneath, are more apt to lead to deterioration of the painting than the use of nearly pure colors applied sparingly and with but little thinning medium. The slow but gradual destruction of many of the world's masterpieces in this manner is a heavy loss; the paintings in the great Louvre galleries in Paris, left uncleaned, darken very perceptibly in the course of 20 years.

The invention of oil painting was ascribed in Vasari's time to the Flemish painter Jan van Eyck (q.v.) (died 1440), but something, at least, of the art had been known much earlier. In a technical work, the 'Book of Art' by Cennino Cennini, one of the later followers of Giotto (1276-1336), the mixing of pigments with boiled linseed oil is mentioned, though not with reference to artistic works. The brothers Van Eyck (Hubert and Jan) seem to be entitled to the honor of having first availed themselves of the great advantages possessed by the oil pigments with their slow drying qualities, which permitted the mingling of the colors on their palattes and their canvases. They are said to have mastered the properties of color from Pliny's 'Historia Naturalis.' In the old tempera painting, the colors were laid on and dried, practically, one at a time. In the first half of the 15th century the painters of northern Italy heard of the new method of the Van Eycks, and experimented with it; Antonello da Messina (q.v.), a Sicilian painter (1430-79), saw in the possession of Alphonso, king of Naples, a painting by Jan van Eyck, and was so much impressed by it that he journeyed to Bruges to study the new art, and brought it back to his compatriots in 1465. It was practised in Tuscany earlier than in Venice, and with different methods in Florence and Venice, but its adoption was gradual. It is related that Sebastiano del Piombo lost the friendship of Michelangelo (q.v.) by endeavoring to induce him to adopt this method for his 'Last Judgment' in the Sistine Chapel; and the almost complete destruction of Leonardo da Vinci's (q.v.) 'Last Supper' (1498) is attributed to the use of oil on the plaster wall, while the fresco (*buon fresco*) of the 'Crucifixion' by Donato Montorfano, painted in 1495,

is still in good condition, though exposed to the same unfavorable conditions. Some of the Italian painters, including Perugino (q.v.), Pollaiuolo (q.v.), and Andrea Verrocchio (q.v.) employed a mixed method, partly oil and partly a species of tempera, in their easel pictures. A few of the moderns, as Gustave Moreau (q.v.), have combined this method with water-color, or other processes. It is remarkable that the very earliest oil paintings, those by the Van Eycks and their Flemish contemporaries, are among the most perfectly preserved of any that have come down to us. Several attempts to discover a satisfactory substitute for oil have been made in modern times, as, the water-glass (stereochromy) invented by the German chemist Von Fuchs, and practised by Kaulbach and his school and by the English painter MacIse, used for mural paintings; the mixture of copal, wax, resin and oil by Lord Leighton and some of his compatriots in mural work, and, the latest, the "solid oil colors" of Jean François Raffaelli, the Parisian painter, for easel pictures. For the preference displayed by modern artists for this medium there are several reasons — general convenience and ease of handling, and certain properties in the oil medium which seem to enable the painter better to represent — or, at least, suggest — the material aspects of Nature and of both animate and inanimate objects, real or imaginary. The materials and processes of tempera, fresco (q.v.), water-color (q.v.), and pastel (q.v.), all possess various disadvantages, both material and artistic, for general use. See MURAL PAINTING; PAINTING, TECHNIQUE OF.

OIL-PALM. See PALM-OIL.

OIL RIVERS, rivers of the Niger Delta, chief among which are Benin, Brass, New Calabar, Bonny, Opobo, Kwo-Ibo and Old Calabar, in the Niger Coast Protectorate, formerly known as the Oil Rivers Protectorate. The rivers are named from the oil palm district through which they flow and are navigable to steamers of light draught.

OIL SHALE. In various parts of the world there are shales containing organic matter in greater or less proportion and which on heating in suitable retorts yield crude petroleum. Such shales have been utilized to some

extent in this way and the original kerosene or "coal oil" was obtained many years ago by distilling coaly shales. Vast deposits of oil shales occur in the United States, notably in a wide area in northeastern Utah and northwestern Colorado, which some time will be used as a source of gasoline, kerosene and other petroleum derivatives. Much of the shale will yield a barrel of distillate or crude oil to a ton of shale. The highly carbonaceous shale Torbanite of Scotland and certain shales in New South Wales yield twice this amount. According to Baskerville there were 55 shale oil companies in the United States in 1860 and although the output was small there was great promise of increase when the discovery of petroleum paralyzed the industry.

For many years shales have been worked extensively for oil in the West and Midlothian districts in Scotland. In 1915 six companies were engaged in the industry. The beds are mostly from one to eight feet thick, and while the material varies considerably in composition the shales yield from 20 to 40 gallons of oil and 30 to 60 pounds of ammonia sulphate to the ton. The shale is quarried or mined like coal, crushed and distilled in huge retorts, when it gives off crude oil, ammonia and fuel gas. The crude oil can be worked up into many products. Very little oil is contained in the shale, most of the organic material being bituminized vegetable matter which the heat converts into oil and the other products. Ordinary oil shale consists of about 60 per cent of ash or 10 times as much as ordinary coal. Its specific gravity averages 1.6 or much higher than coal, and the richer shales are lighter than the lean material. Ordinarily the shale yielding the most oil yields less ammonia, but the ratio of products depends somewhat upon conditions of distillation. Good shale is distinguished from common more or less carbonaceous shale by its brown streak, toughness and not crumbling on exposure to the weather. It consists of thin layers, but the layers are not readily separable and it is somewhat flexible as well as tough. When cut with a sharp knife the edges of the layers curl up as they are severed.

The amount of shale mined annually in Scotland averages nearly 3,000,000 tons, which produce about 65,000,000 gallons of crude oil, or more than 20 gallons to the ton. This oil yields about 3,000,000 gallons of naphtha, 18,000,000 gallons of burning oils, 40,000 gallons of lubricating oils, 25,000 tons of paraffin and 50,000 tons of ammonia salts. The cost of mining and distillation is stated to average about \$1.85 a ton, or nine cents a gallon, for the crude oil. The gas given off is sufficient to furnish the heat for the distilling process. It has been estimated that a plant with capacity of 700 to 800 tons daily would cost about \$500,000 in Scotland.

The oil distilled from shale at Broxburn yielded the following products on redistillation:

Naphtha.....	sp. gr. .740	1.36 per cent.
Kerosene.....	.810	31.60 "
".....	.840	4.86 "
Lubricating oil.....	.865	10.30 "
".....	.885	10.08 "
Paraffin.....		10.52 "
		68.72 "
Loss in refining.....		31.28 "

Large deposits of oil shales occur in New Brunswick. Working tests of these shales made in Scotland showed yields of from 37 to 45 barrels of oil and 58 to 100 pounds of ammonium sulphate to the ton. Oil shale from Castillon, Spain, is reported to yield 13½ gallons of crude oil to the ton, and shales from Asia Minor 30 to 40 gallons. Extensive deposits are reported in Brazil, New Zealand and South Africa.

In the Uinta Basin in northeastern Utah and northwestern Colorado there are extensive deposits of oil shale in the Green River formation of early Tertiary age. The shale is in several beds, some of them four to 10 feet thick, and so extensively exposed that vast amounts are easily mined. The richer shale is black or brownish. It has been estimated (by Winchester) that in the Utah part of the basin there is enough shale to produce 42,800,000,000 barrels of crude oil and 500,000,000 tons of ammonium sulphate. In Colorado there is sufficient shale in beds three feet or more thick and richer than the Scottish shale which will yield about 20,000,000,000 barrels of crude oil and 300,000,000 tons of ammonium sulphate. These deposits have the great advantage of being at or near the surface so that they can be worked very cheaply. Many field tests made by distilling the Utah and Colorado shales gave yields that varied greatly, but more than half the samples yielded from 25 to 30 gallons of crude oil and more than five pounds of ammonium sulphate. The specific gravity varied from .859 to .933 with an average of .897. Fractionation of the distillate gave gasoline (to 150° C.) seven to 12 per cent; kerosene (150-300° C.), 28.5 to 49 per cent; paraffin, 1.63 to 9.21 per cent, and asphalt, 0.47 to 4.10 per cent; with some sulphur and nitrogen.

A large area of the Uinta oil shale district has been set aside as an oil reserve for the Navy Department.

More than a dozen large companies have been organized to win oil from these shales and are now making experiments to determine the most efficient and economical way of doing so. Aerial tramways are being built to bring the shale from mines to be opened high on the sides of the mountains down to retorts or distillation plants to be built in the valleys near water and near lines of transportation.

Chemists are finding that a great many useful things can be made from the oil shales—such as dyes, explosives, paints, fertilizers and substitutes for rubber, as well as gasoline, kerosene, paraffin and flotation oil—but the industry is not yet far enough advanced to enable anyone to tell which of these products or how many of them can be manufactured at a profit. The industry must eventually succeed, but its success may depend largely on the profits derived from the sale of the by-products.

Oil shales appear to owe their peculiar properties to partly bituminized vegetable debris originally deposited with the fine silt of the shale. Most of the oil is developed by the destructive distillation, although a small amount of petroleum exists in the rock and may be extracted by ether, carbon bisulphide and other solvents. Thin sections made by the late C. A. Davis revealed an admixture of a number of more or less decomposed plant fragments, algae, fungi, spores, pollen and bacteria in a

jelly-like mass intermixed with very fine particles of silt.

N. H. DARTON,

Geologist, United States Geological Survey.

OIL SHARK, SOUP-FIN SHARK, a shark (*Galeorhinus zyopterus*) of the southern Pacific Coast, allied to the topes, grayish, and often six feet in length. Its liver yields a large quantity of valuable oil, and its fins are highly prized by the Chinese as a material for soup; hence its popular name. From the fins, when dried, a fine white gelatin is obtained. The oil shark is generally caught during July and August when it enters quiet bays, river mouths and protected places along shore to deposit its young.

OIL-STONE, a slab of fine-grained abrasive stone, used for imparting a keen edge to tools. It is so called because oil is used for lubricating its rubbing surface. The most extensively used oil-stones in the United States come from Arkansas and Indiana. Formerly there were large importations of oil-stones from Germany. The Kansas stones, which are of white siliceous rock of a very fine texture, are known as Washita or Arkansas stones, while the Indiana stones, which are also very fine grained, are marked under the names of Hindostan or Orange stones. Oil-stones are also made artificially, and of these one of the best is made from powdered corborundum.

OIL WELLS. See PETROLEUM.

OILED ROADBEDS. See OIL; PETROLEUM.

OISE, wāz, (1) a river of France, which rises near Selogne on the frontier, in the forest of Thierache, among the Ardennes, Hainaut, Belgium, flows southwest across the departments of Aisne-et-Oise, and joins the Seine about six miles below Pontoise in the department of Seine-et-Oise. (2) A northern department of France named after the river. The greater part of the surface, which is generally more or less level, is in normal times extensively cultivated. The department of the Oise

lies on both sides of the river of the same name, north of the departments of Seine-et-Oise and Seine-et-Marne. Before the devastations of the European War it produced extensively cereals, beets, sugar, potatoes, fine grapes and other fruits and cattle. It is also a well-developed industrial region, manufacturing iron, paper, chemicals, pottery and textiles. Area, 2,272 square miles; pop. about 423,000. Capital, Beauvais.

OJÉDA, ō-hā'dā, Alonzo de, Spanish cavalier and explorer: b. Cuenca, about 1468; d. Santo Domingo, 1515. He sailed with Columbus on his second voyage in 1493 and thereafter identified himself intimately with the exploration and occupation of the New World. In 1495 he performed a feat of great boldness in the capture of the cacique Caonabo. In 1499, with Juan de la Cosa, former pilot of Columbus, and accompanied also by Amerigo Vespucci, he explored the northern coast of South America from a point probably on the north of the present Brazil westward to the Gulf of Venezuela. On a charge of trespassing, during a second voyage in 1502, upon territory belonging to Portugal, he was arraigned, after his return, and punished by censure and fine. After being imprisoned for debt in Spain, he sailed for the third time for South America in 1505 and explored to the Gulf of Darien. In November 1509, with over 300 men, he made an abortive attempt to capture Nueva Andalusia, between the Gulf of Darien and the Gulf of Venezuela, of which territory he had been appointed governor. Ojéda next established a colony at San Sebastian, but ran short of provisions and, sailing for Hispaniola in quest of reinforcements and supplies, was shipwrecked on the coast of Cuba, and died in poverty and wretchedness at Santo Domingo.

OJÉDA, Emilio de, Spanish diplomat. After holding several minor diplomatic posts he became first secretary of the Spanish embassy at London in 1880, was chargé d'affaires in Bolivia and in 1883 Minister Resident in Montevideo, in 1884 at Lima and at Athens in 1888. In 1890 he was made Minister Plenipotentiary to Peru, to Morocco in 1894 and secretary of the Spanish commission to arrange a treaty of peace with the United States in 1898. He succeeded the Duke de Arcos as Minister to the United States in June 1902.

OJETTI, ō-yāt'tē, Ugo, Italian author: b. 1871. He attained a considerable reputation as an art critic and lecturer, was an extensive contributor to *Corriere della Sera*, Milan, and in 1915 became editor-in-chief of the committee in charge of publishing a series of works bearing on Italy's part in the war, 'Problemi italiani.' Author of 'Senza Dis' (1894); 'Il Vecchio' (1898); 'L'America vittoriosa,' travels (1899); 'L'ailet,' comedy (1908); 'I capricci del conte Ottavio' (2 vols., 1908-09); 'Ritratti d'artisti italiani' (1911); 'L'Amore e suo figlio,' novel (1913); 'L'Italia e la civiltà tedesca' (1915); 'I monumenti italiani e la guerra' (1917), etc.

OJIBWAY, the largest and most important of the Algonquin tribes. See CHIPPEWA.

OJIER, ō'yē-ā, THE DANE, Frankish Duke of Autchar, romantic hero of Charlemagne's court and legendary hero of the Danes. Ac-

cording to the old chronicles he safeguarded the journey of Gerberga, widow of Charlemagne's brother Caroloman, and her children to the court of the king of Lombardy in 771 or 772 and after various military exploits entered the cloister of Saint Faro at Meaux, where he died. Other versions place him as the son of Geoffrey, King of Denmark, and make him hostage for his father at the court of Charlemagne, where he gained high favor with the emperor through his military prowess. His son being slain by Charlemagne's son, Charlot, Ojier killed the queen's nephew and the emperor's life was saved from his fury only through the prompt action of the knights, who, however, permitted him to escape to his Normandy stronghold, Castelfort. Here he withstood a seven years' siege but was eventually captured and imprisoned at Rheims. He obtained his release through the necessity for securing a champion to meet the giant Saracen chief, Bréhus, whose forces were overrunning France. He defeated the giant, married an English princess and, again in high favor with Charlemagne, was rewarded with the fiefs of Brabant and Hainaut. A later version adds a touch of magic in which he is under the protection of the fairies. Morgan la Fay, I's principal fairy guardian, rescues him at various critical times, and he is supposed to have dwelt 200 years, in her castle of Avalon. There are Italian and German versions of the hero's exploits, and in Danish legend he became Holger Danske a great champion of the Danes and who is supposed to sleep in a mountain ready to waken and come to the defense of Denmark in time of need. Consult Barrois, J. B., 'La Chevalerie Ojier de Danemarche' (2 vols., 1842); Pio, L., 'Sagnet om Holger Danske' (1870).

OJINAGA, ō'hē-nā'gā, or **VILLA DE OJINAGA** (formerly **PRESIDIO DEL NORTE**), Mexico, town in Chihuahua, at the confluence of the Rio Grande and the Rio Conchas, nearly opposite but slightly below Presidio, Texas. It has an important export and import trade with the United States. It was the scene of military activities in 1912 and in 1914 in the Mexican revolution.

O.K., a term signifying all right, correct, the origin of which is generally ascribed to Andrew Jackson, seventh President of the United States. The story originated with Seba Smith (Major Downing), the humorist, that Jackson used O. K. to endorse official papers as correct, or as Smith put it, "Orl Korrekt," and the term became a by-word in the Presidential campaign of 1832, being used by Jackson's opponents as an illustration of his illiteracy. According to Parton Jackson endorsed legal documents with O. R. (order recorded); and this may have occasioned the jest about "O. K." The term has also been ascribed to an Indian chief, "Old Keokuk," who was accustomed to sign documents with the initials O. K. It is now commonly used to signify worth, merit or excellence. The term O. K. has also been ascribed to Josh Billings, John Jacob Astor and several other characters; but it is probable that it is older than any of these and that it had its origin in Aux Cayes from which the best tobacco and rum were imported in Colonial days. The port was frequently

written O. K., the literal pronunciation or sound of the name itself.

OKA, ō'ka ("gold fish"), Canada, a Catholic mission settlement of Iroquois and Algonquin Indians, on the Lake of Two Mountains, near Montreal. It was settled by some 900 Iroquois Catholic converts from Sault au Recollet, in 1720, who were shortly afterward joined by Algonquins from the Isle aux Tourtes. The Mohawk and Algonquin languages are spoken by the respective bodies, who inhabit different sections of the village. A branch settlement exists at Watha (Gilson), Ontario, since 1881. The total number at Gilson and Oka is about 600.

OKA, ō-kā', two rivers of European and Asiatic Russia. (1) Oka, in Europe, rises in the government of Orel, flows north till near the town of Kaluga, then east past that town, east-northeast across Riazan and the east of Vladimir, and after a course of about 600 miles, navigable from Orel, joins the Volga at Nizhni-Novgorod after a course of nearly about 1,000 miles of country, for the most part fertile and populous. The Oka is navigable for ordinary river steamers for 850 miles and for smaller boats for 900 miles. Consequently there is much traffic on it. (2) Oka, Asiatic Russia, rises in the mountains between China and the government of Irkutsk, flows north-northeast for 400 miles, and joins the Angara at Bratsk.

OKAPI, the native African name of a large animal (*Ocapia johnstoni*) of the giraffe family which inhabits the forests of the upper Kongo Valley. It had been vaguely known previously, but the first specimen and description given to science were obtained by Sir Harry Johnston in 1899, in the Semliki forest, near the Uganda border. The animal has many of the features of a giraffe, such as drooping hindquarters, a short tufted tail and a skull of similar shape, with vestiges of three horn pedicels or cores, but, of course, no external horns. The neck is short, thick and maneless. The head is long and narrow, the ears large, the eyes far from ears, and the lips prolonged and mobile, suited to grasping the leaves of trees, upon which they are said by the negroes to feed. The size is that of a medium antelope, about four and a half feet tall at the withers. The colors are remarkable. The head, neck and body generally, as described by Johnston, range in color from warm purplish red to sepia and jet-black; but the cheeks are yellowish-white; the legs are cream-white on their lower part and above broken into rings or stripes of alternate black and white extending on the hams up to the root of the tail. A single stuffed and mounted skin is deposited in the British Museum.

These animals seem uncommon, and dwell in almost inaccessible forests, where they are said to go about alone or in pairs. It is probable that they may be the lingering survivors of a species now nearly extinct which formerly ranged far more widely, especially to the northward, since Egyptologists at once recognized this animal as the prototype of the figure of the ancient Egyptian deity Set, whose curious head has heretofore eluded identification. For the discovery of the okapi, consult 'Transactions' and 'Proceedings' of the London Zoological Society (1901, 1902); and for its identification

with the figure of Set, consult 'Scientific American Supplement' (28 March 1903), and the writings of Wiedemann; Johnston, Sir H. H., 'Okapi' (Smithsonian Institute Report, 1901, published Washington, 1902).

OKAYAMA, ō-kā-yā-mā, Japan, a town and capital of a prefecture of the same name in the province of Bizen, on the island of Hondo, near the shore of the Inland Sea separating it from Shikoku, 89 miles to the west of Kobé.

OKEECHOBEE, ō-kē-chō'bē ('Big Water'), a lake in Florida, in the southern part of the State. It is about 40 miles long and 28 miles wide; depth from a few inches to 13 feet. It is on the northern border of the Everglades (q.v.), and it seems to be changing slowly, as no doubt the Everglades have changed. Vegetation is increasing within the lake and the marshy shores are encroaching upon the lake boundaries. Caloosahatchee River, by means of canals, has been made an outlet, but considerable of the water spreads over the Everglades. The canals mentioned have reduced the area of the lake and drained portions of the Everglades so as to make them suitable for raising certain crops. Okeechobee is the largest lake in the Southern States.

O'KEEFFE, ō-kēf', John, Irish actor and dramatist: b. Dublin, 24 June 1747; d. Southampton, England, 4 Feb. 1833. He was an actor in Henry Mossop's stock company for 12 years, but his sight began to fail when he was 23 and he turned to the writing of comedies, comic opera and farces. His farce 'Tony Lumpkin in Town' (1773) was produced in Dublin, and it later enjoyed a considerable success at the Haymarket Theatre in London (1778). Despite failing vision he became a prolific writer of plays and verse, most of which was dictated to a secretary; but the approaching blindness, which overtook him in 1797, had no dampening effect upon the gaiety and humor of his work. Many of the songs from his operas remained popular for years and some, like 'I am a Friar of Orders Gray' and 'Amo Amas I Love a Lassie,' are still sung. He wrote some 68 plays, of which about 50 were produced and many were highly successful. Hazlitt terming him "The English Molière." He was in straightened circumstances for a time after becoming totally blind, but a benefit at Covent Garden, under the patronage of the Prince of Wales, netted him a considerable sum in 1800, and he was granted an annuity of 20 guineas from Covent Garden Theatre. In 1820 he was granted a pension from the privy purse amounting to 100 guineas annually. Of his many plays, 'Wild Oats' (1791) and 'The Castle of Andalusia' (1782) alone have survived to be given modern stage presentation. Among the most successful besides these were 'The Agreeable Surprise' (1781); 'Peeking Tom of Coventry' (1784); 'The Highland Reel' (1778); 'Tony Lumpkin's Rambles' (1792); 'The Eleventh of June' (1798). An edition of his plays was produced (4 vols., 1798) but did not include many of his greatest successes as the copyrights had previously been sold. He was also author of 'Recollections' (1826), later edited by Stoddard, R. H., in 'Personal Reminiscences by

O'Keefe, Kelly and Taylor' (New York 1875); and two volumes of verse, 'Oatlands, or the Transfer of the Laurel' (1795); 'A Father's Legacy to His Daughter' (1834).

OKEFINOKE (ō-kē-fi-nō'kē) **SWAMP** ('trembling earth') in the southeastern part of Georgia, occupies nearly all of Charlton County, and parts of Ware and Clinch Counties, extending into Baker County, Florida. The area is about 660 square miles. In the eastern part is a lake containing several small floating islands, the marshy shores of which show the same formation as Okeechobee (q.v.) Lake in Florida. In some parts of the swamp, which is from 40 to 70 miles from the coast, are large trees and a dense low vegetation. In places where the sandy soil rises above the surface of the swamp water there are pine forests, in some places open, in others very dense. In the thicker forests are black gum, cypress and other swamp trees. These are interspersed with open grassy spaces locally known as "prairies" and little lakes. Alligators and moccasins inhabit this swamp in large numbers.

OKEGHEM, ō'kē-gēm, or **OKEHEM**, **OKENGHAM**, **OCKEGHEM**, **OCKENHEIM**, Joannes, Flemish composer: b. probably at Termonde, East Flanders, early in the 15th century; d. Tours, probably 1513. He was a singer at the Antwerp Cathedral and is supposed to have received his education there. He entered the service of the King of France in 1452 and became head of the chapel of Charles VII. He remained in the service of the royal house through the reigns of Louis XI and Charles VIII but retired to Tours on the accession of Louis XII in 1498. He was regarded as the head of the second and greatest Netherlandish school of music, was credited with the invention of canonic and contrapuntal art, and with that of counterpoint and canon. Among his pupils were Josquin Després, De la Rue and others through whom his art was carried into the foremost musical circles of the world. Most of his compositions are thought to have been destroyed during military invasions but enough remain to evidence the great progress made during the 40 years of his leadership. There remain six masses, an Ave, six motets, a number of songs and other compositions.

O'KELLY, Charles, Irish historian: b. Screen Castle, Galway, 1621; d. 1695. He was educated at the Irish College in Saint Omer, France, and upon the outbreak of the Civil War in England in 1642, took his stand with the king, but in consequence of the outcome of the war in Cromwell's favor was forced to leave the country and, with about 2,000 compatriots and followers, continued to render service to the royal house under Charles II in France and Spain, subsequently serving as colonel of cavalry. Upon returning to England after the Restoration, O'Kelly attended the Dublin Parliament of James II in 1689 as a representative of Roscommon. In 1691 he was entrusted with the defense of the island of Bofin against the Orange troops, but was compelled to capitulate and after the Treaty of Limerick retired to private life. He is perhaps better known as the author of the history of the Revolution, 'Macariae' (1692), of which three editions have appeared: (1) that of the Camden Society in

1842; (2) the annotated edition of 1850, prepared for the Irish Archaeological Society by J. C. O'Callaghan; and (3) that which appeared in 1894 as 'The Jacobite War in Ireland.'

O'KELLY, James, American Methodist Episcopal minister: b. Ireland, about 1757; d. in North Carolina, 1826. Emigrating to the United States in 1778 he became a Methodist preacher, traveling from place to place. When the Methodist Episcopal Church in the United States was organized (1784) he was one of the elders ordained, and later he held the position of presiding elder in the district of South Virginia. He was soon afterward found in opposition to his denomination regarding the life-tenure and powers of the bishops, and the General Conference of 1792 was followed by his withdrawal, which led to the first secession from that ecclesiastical body, several churches and ministers joining with O'Kelly to form the Republican Methodist Church. His determined fight against the Episcopacy, though it failed to dislodge the innovation of the bishopric, gave the practical ends for which he contended to the lower ranks of the Methodist ministry. By 1795 the defections from the Methodist Episcopal Church caused by O'Kelly's agitation reached almost 6,500. His Republican Methodist Church changed its name to "Christian Church" (q.v.). Consult Buckley, 'History of Methodism in the United States' (New York 1898).

OKEN, ǝ'kēn, or OKENFUSS, Lorenz, German naturalist: b. Bohlshach, Württemberg, 1 Aug. 1779; d. Zürich, 11 Aug. 1851. He studied natural history and medicine at the University of Würzburg. In 1802 he published 'Grundriss der Natur-Philosophie,' in which he reduced to a system the materials Fichte and Schelling had previously undertaken to arrange; in this he maintained that animal classes are simply a representation of the organs of sense and divided the animal kingdom accordingly into five classes. In 'Die Zeugung' (1805) he advanced the doctrine that all organic beings originate from and consist of vesicles or cells. He was professor of medicine at Jena in 1807 and of natural science in 1812; but he was forced to resign because of his attitude toward the government, 1819. In 1828 he became professor of science in the University of Munich and in 1833 he went to the University of Zürich where he remained until his death. His inaugural discourse at the University of Jena 'Ueber die Bedeutung der Schädelknochen' or 'On the Signification of the Bones of the Skull,' which was published later, became popular. In 1808 he announced the propositions that organism is a combination of the activities of the universe, within a single individual body and that world and organism are one in kind; that light is only a polar tension of the ether evoked by a central body in antagonism with the planets and heat only the motion of this ether. His 'Lehrbuch der Natur-Philosophie' appeared in 1809-11. In 1816 he began the publication of his periodical, the *Isis*, devoted principally to natural science. In 1821 he originated the annual general meetings of German naturalists in different cities, the first of which was held at Leipzig in 1822. The British and American associations for the advancement of science have been since then instituted more or less after the German model.

His other published works include 'Lehrbuch der Naturgeschichte' (1813-27), and 'Allgemeine Naturgeschichte' (1833-42).

OKINAGAN, ǝ'kē-nā'gan, North American Indian tribe of the Salishan family, formerly occupying the territory to the west of Okanogan River, Wash., from Old Fort Okanogan to the Canadian border and in British Columbia, the country around Okanogan Lake. Subsequently they drove the Athapaskan tribe from the Similkameen Valley and occupied that territory. There are reservations in which 527 of them lived at Colville, Wash., in 1906, and 824 lived at the Kamloops-Okanagan agency, British Columbia in that year.

OKLAHOMA (Choctaw Indian, land of the red men), one of the southwest central states of the United States. It was admitted to the Union in 1907 by joining Indian Territory and Oklahoma Territory. It was the 46th State admitted to the Union. It contains an area of 70,057 square miles and lies between 33° and 35° and 37° N. and long. 94° and 29° and 103° W. It is bounded on the north by Kansas and Colorado, on the east by Missouri and Arkansas and on the west by Texas and New Mexico and on the south by Texas. The Red River forming the whole of its southern boundary.

Physiography.—Oklahoma lies entirely in the Mississippi River Basin. Its drainage finds its way through the Arkansas and Red rivers and their tributaries. While the surface of the State as a whole is a plain, this plain is broken in different sections by hilly lands and small mountains. The Ozark Mountains are in the northeastern part of the State and the Ouachita in the southeastern part and the Arbuckle and the Wichita mountains in the southern portion. In the southern part of the State some of the mountain peaks rise 1,500 feet above their base. The surface of Oklahoma slopes from the northwest to the southeast. The altitude ranges from about 4,500 feet in the extreme northwest corner near the Colorado border to a little less than 400 in the southeastern corner where the Oklahoma-Arkansas line meets the Red River.

Climate.—The climate of Oklahoma is temperate. The extreme seasonal changes range from a little below zero in the winter to a little over 100° in the summer. The temperature decreases 1° for about 65 feet of elevation, so the northern and western parts of the State are cooler than the southern and eastern parts. The average temperature for 10 years for January was 37.87°, while the average temperature for August for the same period was 81.55°.

Population.—According to the Federal census of 1920 the population of Oklahoma is 2,028,283. Of these about 57,337 are Indians and about 149,408 negroes. About 2.0 per cent of the population is foreign born, over 7,000 or 17.6 per cent of the foreign population having come from Germany. About 40 per cent of the native population was born in the State. Every State in the Union is numerously represented, but Texas, Missouri, Kansas and Arkansas predominate. In 1910 there were only eight cities with populations of over 8,000. This number has been greatly increased by the discovery and development of new oil fields. Oklahoma City in

had a population of 91,295, Tulsa, 79,952, Muskogee, 30,277, Ardmore, 14,181, McAlester, 12,095, Shawnee, 15,348, Guthrie, 11,757, Enid, 16,576, Bartlesville, 14,417, Okmulgee, 17,430.

Mineral Resources.—Oklahoma is one of the richest States in the Union in mineral resources. The mineral resources of the State include oil, gas, coal, lead and zinc ore, asphalt, shale, clay, glass sand, sand and gravel, sandstone, limestone, marble, granite, gabbro, Portland cement rock, gypsum, salt, iron ore, manganese ore, tripoli, volcanic ash, copper ore and mineral waters. Of the above-mentioned resources the following are being developed and marketed in their original form or as manufactured products: oil, gas, coal, lead and zinc ores, pyrites, manganese ore, asphalt, gypsum, granite, sand and gravel, limestone as building stone, crushed rock and lime, sandstone. Portland cement, clay products, tripoli and mineral waters.

Oil and Gas.—Oil and gas is by far the most important industry being developed in Oklahoma at the present time. During the past few years Oklahoma has ranked first in both production and value of petroleum among the producing States of the Union. There are at present over 100 oil and gas fields in Oklahoma. The total production of petroleum in Oklahoma

first coal mined in Oklahoma on a commercial scale was in old Indian Territory in 1872. In 1890 Oklahoma produced 869,230 short tons and in 1907 had increased to 3,642,658 tons and remained near these figures until 1920, when 4,849,288 tons were produced. Coal was mined in 12 counties in 1919. In 1922 production amounted to 2,800,000 short tons, as compared with 3,362,623 short tons in 1921.

Lead and Zinc.—In Oklahoma, in 1919, according to the 14th Federal census, the mineral industry, second in importance, ranked by value of products, was the mining of lead and zinc ores in Ottawa County. This industry reported products valued at \$18,979,726 or 6.7 per cent of the total value of the products of the State. It also employed 15.5 per cent of the total number of wage-earners. One hundred and eleven enterprises were in operation that year when, in the production of lead and zinc, Oklahoma outranked all other States. In 1920 the lead produced totaled 65,394 short tons valued at \$10,463,040; in 1921 production of lead amounted to 41,552 short tons, valued at \$3,739,680. Zinc produced in 1920 totaled 219,727 short tons valued at \$35,595,774. In 1921 production dropped to 121,372 short tons valued at \$12,137,200.

TABLE SHOWING PRODUCTION AND VALUE OF PETROLEUM, ZINC AND LEAD AND COAL, 1915-21.

PRODUCTS	1915		1920		1921	
	Amount	Value	Amount	Value	Amount	Value
		Dollars		Dollars		Dollars
Petroleum (barrels).....	123,000,000	70,500,000	106,206,000	356,439,000	114,634,000	183,185,000
Lead (short tons).....	*		65,394	10,463,040	41,552	3,739,680
Coal.....	2,990,450	5,980,900	4,849,288	23,294,000	3,362,623	15,546,000
Natural gas (M. cu. ft.)..			154,467,200	25,805,000	124,058,000	23,429,000
Zinc (short tons).....			219,727	35,595,774	121,372	12,137,200

* Lead and zinc together, valued at \$4,236,632 in 1915.

from 1891 to and including 1922 was estimated at 1,428,000,000 barrels. In 1922 146,631,000 barrels, valued at \$251,300,000 were produced. Oklahoma ranks second among the States in the marketed production of natural gas. The marketed production in 1921 was estimated at 124,000,000,000 cubic feet as compared to 123,517,358,000 cubic feet in 1916, valued at \$19,216,000 and \$11,980,000, respectively.

Coal.—The coal field of Oklahoma lies in the eastern and northeastern parts of the State and includes about 12,000 square miles. The

Agriculture.—The land area of Oklahoma is 44,424,960 acres. Lands in farms in 1920 totaled 31,951,934 acres; improved land in farms, 18,125,321 acres; woodland in farms, 4,206,171 acres; other unimproved land in farms, 9,620,442 acres. Farms in the State numbered 191,988—93,217 operated by owners and 97,836 operated by tenants. Farm lands were valued at \$1,171,459,364 in 1920; all farm property at \$1,660,423,544.

The following table gives the acreage, production and value of the leading crops for 1922.

ACREAGE, PRODUCTION AND VALUE OF THE LEADING CROPS FOR 1922.

CROP	Acreage	Yield	Value	Value per acre
Corn.....	3,200,000	57,600,000 bu.	\$40,320,000	\$12 60
Wheat.....	3,300,000	31,350,000 bu.	30,723,000	9 31
Barley.....	129,000	2,193,000 bu.	1,206,000	9 35
Oats.....	1,500,000	30,000,000 bu.	13,500,000	9 00
Rye.....	31,000	310,000 bu.	248,000	8 00

Sweet potatoes.....	27,000	2,052,000 bu.	2,421,000	89 68
Cotton.....	2,951,000	635,000 bales	73,025,000	23 69

OKLAHOMA

State Capitol at Oklahoma City

Livestock.—The following table will give the number and value of the livestock of the State for 1917 and 1923 as compiled from the report of the United States Department of Agriculture:

NUMBER AND VALUE OF THE LIVESTOCK OF THE STATE FOR 1917 AND 1923.

	1917		1923	
	Number	Value	Number	Value
Horses.....	702,908	\$59,747,000	715,000	\$28,600,000
Mules.....	269,125	27,451,000	337,000	19,546,000
Milch cows.....	512,847	29,745,000	566,000	19,244,000
Other cattle.....	1,234,264	46,902,000	1,364,000	22,915,000
Sheep and goats.....	81,026	405,000	87,000	505,000
Swine.....	940,837	9,480,000	1,401,000	12,329,000
Total.....	3,741,007	\$173,730,000	4,470,000	\$103,139,000

Dairy Progress in Oklahoma.*—"The dairy industry became more firmly established in Oklahoma in 1918 than perhaps ever before. The farmers in general purchased more milk cows, and correspondence from farmers and breeders showed an increased interest in better cows, in the building of silos, and in growing more feed on their own farms, as well as better methods of feeding cattle. The high prices which farmers received for butter fat in that war year was a great stimulus to more dairying even though prices of feed which had to be purchased were high. Several new breeders of purebred dairy cattle were added to the previous list of breeders and these new breeders manifested great interest in dairying. The southeastern section of Oklahoma has perhaps the best natural facilities for more dairying. A number of new co-operative and local creameries were established during 1918 and are being successfully operated. One of these creameries operated a cheese factory and demonstrated that cheese can be successfully manufactured under factory conditions at least during the cooler portion of the year." Butter produced in 1919 totaled 33,021,095 pounds; cheese, 11,116 pounds; milk sold, 118,127,327 gallons.

Honey Bees.—The Fourteenth Census of the United States reported 46,743 hives of bees in Oklahoma in 1919. Honey produced that year totaled 357,677 pounds valued at \$103,728. Wax produced was 2,916 pounds valued at \$1,139.

Banks.—The great impetus given to industrial development by the opening up of oil and

case of bank failure. The State banks guarantee law is considered a success. It makes it necessary to have very stringent State banking laws. The condition of the various banks on 30 June 1922 is shown herewith.

Transportation.—The railroad mileage in 1919, not including sidings and spurs, was 6,536.96 miles. The principal systems are as follows: Saint Louis and San Francisco, 1,498 miles; Chicago, Rock Island and Pacific, 1,326 miles; Atcheson, Topeka and Santa Fe, 1,080 miles; Missouri, Kansas and Texas, 703 miles; Missouri, Oklahoma and Gulf, 315 miles; Midland Valley, 245 miles; Missouri Pacific, 161 miles; Fort Smith and Western, 196 miles; Kansas City, Mexico and Northern, 186 miles; Wichita Falls and Northwestern, 328 miles; Kansas City Southern, 142 miles. There are about 14 other short lines in and about the oil fields. There are 2,334 miles of oil pipe lines valued at \$43,270,696.

Industrial Commission.—The constitution of Oklahoma has a strict provision on employers' liability to employees. This provision has been vitalized by appropriate legislation, which provides for an industrial commission to settle questions arising. The report of this commission shows that for the year ending 1 Sept. 1918 there were 19,918 accidents in 33 industrial plants and the compensation paid to the injured for the year amounted to \$663,764.12.

Military.—Oklahoma had a well organized militia at the beginning of the Great War of 1914-18. It comprised about 1,500 enlisted men and 75 officers. It included a regiment of infantry, two troops of cavalry, a company of engineers with a signal corps and sanitary field hospital detachment. The Oklahoma National Guard was called to the Mexican border in 1916 at the time of the Mexican raids across the border. Oklahoma furnished 85,000 men for the War with Germany, many of them for over-sea service. The State was a centre of military activity during the War. Camp Doniphan with a training capacity of about 35,000 men was located at Fort Sill. In 1923 the State militia had an authorized strength of 6,406 men. On 31 May the enlisted strength was 4,151 officers and men.

Manufactures.—In 1914 the value of the products of manufacturing industries of Oklahoma amounted to \$102,005,693 and the total average number of wage-earners employed was 17,443. The State ranked 34th in value of products in 1914 against a rank of 40th in 1909, while in average number of wage-earners it ranked 39th in both 1914 and 1909.

	National	State
Number.....	449	486
Capital.....	\$29,010,000	\$9,800,000
Surplus.....	9,379,000	2,089,000
Deposits.....	310,133,000	74,571,000
Loans.....	209,629,000	68,947,000
Total assets.....	377,105,000	101,360,000

mineral fields of Oklahoma has stimulated the banking industry. State banks are required by law to provide a fund to pay depositors in

* Report of the professor of dairying, Oklahoma, A. & M. College.

In 1919 Oklahoma ranked 30th in value of manufactured products; 38th in the number of wage-earners employed and 37th in the value added by manufacture. In 1919 there were 2,445 manufacturing establishments in the State, a decline of 2.9 per cent from the 1914 figures. However capitalization had increased to \$277,034,318 while the average number of wage-earners employed was 29,503. The value of manufactured products that year was \$401,362,869, and the value added by manufacture, \$88,757,040. From second place in 1914, petroleum refining rose to first place in 1919, exchanging places with the flour-milling industry. Among the States, Oklahoma, in 1919, ranked fifth in the petroleum-refining industry. It ranked eighth in 1914. The total production of refined oils in 1919, including gasoline and naphthas, illuminating oils and lubricating oils, was 33,200,145 barrels of 50 gallons as compared with 8,610,533 barrels in 1914 and 792,682 barrels in 1909. The following table shows the principal industries of the State, ranked by value of products, in 1919:

INDUSTRY	Number	Wage earners	Value of product
All industries.....	2,445	29,503	\$401,363,000
Petroleum, refining.....	66	4,612	\$150,673,000
Flour and grist mill products.....	227	958	49,844,000
Smelting and refining, zinc.....	11	2,272	19,518,000
Cottonseed oil and cake.....	51	930	18,907,000
Foundry and machine shop products.....	114	1,717	13,510,000
Bread and other bakery products.....	288	993	8,129,000
Butter.....	20	301	7,718,000
Printing and publishing newspapers.....	410	1,415	7,705,000
Cars and general shop construction and repairs by steam railroads.....	12	2,687	6,149,000
Lumber and timber products.....	145	1,947	4,904,000
Glass.....	16	1,692	4,751,000
Ice, manufactured.....	115	831	3,574,000
Lumber, planing mill products, not including planing mills connected with saw mills.....	56	546	3,150,000
Printing and publishing, book and job.....	97	505	2,507,000
Coffee roasting and grinding.....	7	168	2,402,000
Confectionery, ice cream.....	45	187	2,246,000
Automobile repairing.....	129	455	2,108,000
Brick and burnt clay ballast.....	22	628	1,679,000
Confectionery.....	28	194	1,345,000
Mineral and carbonated waters.....	79	156	1,292,000
Explosives.....	9	76	1,063,000
Saddlery and harness.....	36	92	1,042,000
Copper, tin and sheet-iron work.....	75	187	984,000
Mattresses and spring beds.....	13	99	700,000
Brooms.....	32	110	696,000
Marble and stone work.....	48	117	688,000
Oil, mineral and composite.....	3	42	681,000
Paving materials.....	13	295	579,000
Shirts.....	4	69	573,000
All other industries.....	274	5,222	82,246,000

Education.—The public school system of Oklahoma is well organized and maintains a high standard of proficiency. All teachers in the public schools must have a high school or normal training and those in high schools must have a college education. The constitution in providing for a public school system expressly declared that separate schools must be provided for white and colored children. This separation

of races also applies to institutions of higher learning whether supported by the State or not. There are 754,117 children of school age in Oklahoma with an enrolment of 559,282. There are 15,389 teachers employed in the public schools. There are 384 schools in Oklahoma doing high school work, with an enrolment of 44,223 and 1,791 teachers.

The University of Oklahoma (q.v.) located at Norman was established by an act of the first Territorial legislature in 1890 and its doors were opened to students in September 1892.

The Agricultural and Mechanical College, located at Stillwater, has a fine plant, with an 80-acre campus and 1,000-acre farm, about 113 instructors and an enrolment of 3,100 students. There are five secondary agricultural colleges in Oklahoma.

Other State educational institutions are six State Normal schools, located at Edmond, Alva, Tahlequah, Durant, Ada and Weatherford, and one Teachers' College.

The State supports a State College for Women at Chickasha, which is growing in strength and equipment, having had appropriated for its support by the 1919 legislature over \$400,000 for the next biennium.

There is a State school for the colored people at Langston which combines in its organization normal, agricultural and college training. The school of mines is at Wilburton and in February 1919 another school of mines was established at Miami in the zinc region. There are State preparatory schools at Claremore and at Tonkawa.

Charities and Correction.—The charitable institutions supported by the State consists of an orphan home at Pryor, a school for the blind at Fort Gibson, a school for the feeble-minded at Enid, a school for the deaf at Sulphur, a reform school for boys at Pauls Valley and an institution for the deaf, blind and orphans for the colored race. Oklahoma supports about 21 educational institutions, not including the charitable institutions. There are denominational colleges as follows: Kingfisher College (Congregational) at Kingfisher, Phillips University (Christian) at Enid, Kendell College (Presbyterian) at Tulsa, the Methodist University at Guthrie, the Baptist College at Shawnee and the Catholic University at Shawnee. The penitentiary of the State is located at McAlisterville and a branch prison at Granite. There are three insane asylums, located at Vanita, Norman and Fort Supply.

Public Lands.—Sections 16 and 36 were set aside for the benefit of public schools. Section 13 in each township of Oklahoma Territory except the original five counties was reserved for institutions of higher learning and the proceeds of it divided between Oklahoma University, Agricultural and Mechanical College and the normal schools. Likewise section 33 in Oklahoma Territory was reserved for public buildings, the proceeds of which go to the construction of buildings of educational institutions, asylums, penitentiaries and the State capitol. The enabling act also reserved from homestead entry and donated to the educational institutions over 1,000,000 acres of land. This latter with section 13 constitutes a land endowment for the educational institutions from which a great part of the revenue

OKLAHOMA

Fields of Kafir corn, Western Oklahoma

necessary to run the schools is derived. The greater part of the lands have been sold and the proceeds invested by lending to farmers on farm lands at 5 per cent. The lands which are not sold are leased and the proceeds used for the purposes specified in the grant.

Government.—The constitution of Oklahoma was formulated in 1906 by a convention and adopted in 1907 by popular vote. The general framework of the State government is like that provided for in other States, consisting of a single executive, bicameral legislature and a system of courts consisting of a Supreme Court, District Courts and County Courts. The constitution provided for the election of all State officers who were to be nominated by a primary election in each party. The constitution provided for the exercise of the initiative and referendum but not for the recall. The constitution also provided that cities of over 2,000 population could form their own charters and under this provision many of the larger cities have adopted the commission or managerial form of government.

Suffrage.—The constitution provided for manhood suffrage which was afterward limited by statute by an educational test and the Grandfather clause. The Grandfather clause was declared unconstitutional by the United States Supreme Court in 1915, the educational test remaining but applied to all alike. At a recent election the constitution has been amended allowing women to vote in all elections.

History.—The first European to visit Oklahoma was Coronado who marched across it in 1541 while searching for the Land of Quivira. During the latter part of the 17th and the first part of the 18th centuries French trappers and traders from the lower Mississippi visited much of the eastern portion of the present State of Oklahoma and gave names to many streams and mountains in that region. All of Oklahoma except the "Panhandle" was a part of the Louisiana Purchase. From 1817 to 1840 was the period during which the great Southern tribes of Indians, the Cherokees, Choctaws, Chickasaws, Creeks and Seminoles, were removed here from Georgia, Alabama, Florida and Mississippi and in which Oklahoma was divided among them and set apart as an Indian Territory. These Indians held slaves and when the Civil War broke out all of these tribes joined the Southern Confederacy. When the war closed they were compelled by the treaties of 1866 to cede to the United States much of their western lands, upon which they had established no settlements, as a home for friendly Indians of other tribes. The Creeks ceded the western half of their lands for which the United States paid them 30 cents an acre. The Seminoles were compelled to cede all of their lands at a price of 15 cents an acre and to accept as a new home a much smaller tract carved out of the lands ceded by the Creeks. The Chickasaws and Choctaws also gave up the western part of their country which had been previously leased to the United States and was known as the "Leased District." For this they received \$300,000. The Cherokees did not absolutely surrender any of their lands but agreed to allow the United States to locate friendly Indians upon that part of their western lands known as the "Outlet"; the title to remain with

the Cherokees until such Indians had been so located. Tribes of Western Indians were accordingly removed to this region and given reservations. Among them were the Cheyenne and Arapaho, Kiowa and Comanche, Sac and Fox, Pawnee, Iowa, Kickapoo, Shawnee, Potawatomi, Wichita, Ponca Sioux, Otoe and Missouri and some others. A large tract near the centre of the present State remained unoccupied. White people were forbidden to settle there but colonization schemes were developed by Capt. David L. Payne and others. President Hayes issued proclamations in 1879 and 1880 forbidding settlement but it was found necessary to use troops to remove the "boomers," as the would-be settlers were called. One of the chief difficulties in the way of the "boomers" were the "cattle-kings," who under leases from Indian tribes or in some cases without any authority whatever were grazing large herds within the limits of Oklahoma. In 1885 Congress authorized the President to negotiate with the Creeks and the Seminoles for the purpose of opening these vacant lands to settlement. This was accomplished in 1889. On 23 March of that year President Harrison under the authority of an Act of Congress approved 2 March issued a proclamation declaring these unoccupied lands would be open to settlement under the homestead laws of the United States at noon 22 April. Troops along the border kept the home-seekers in order until that time when the great crowd that had gathered dashed across the line in a mad race for the best lands and town lots. The entire region was settled almost within a day. Towns were laid out, farms opened up and the population increased at an extraordinary rate. There was no government until May 1890 when an Organic Act was passed by Congress (2 March 1890) creating the Territory of Oklahoma. By this act the "Panhandle" which had been a veritable "No Man's Land" was made a part of Oklahoma and provisions were made for other additions as fast as the various Indian reservations were opened to settlement. The Organic Act provided for a governor, a secretary and a Supreme Court appointed by the President and for a bicameral legislature elected by the people. The first governor was George W. Steele and the first legislature met at Guthrie on 27 August. Other Indian lands were opened to settlement in 1891, 1892, 1893, 1901 and 1906 while Greer County, a tract claimed by Texas, was awarded to the United States by the Supreme Court in 1895 and immediately attached to Oklahoma. The agitation for statehood began in 1891. There was much discussion as to whether Oklahoma and Indian Territory should be joined to make one State or admitted separately as two States. A bill admitting Oklahoma passed the House of the 57th Congress but failed in the Senate. Indian Territory made but little effort to secure separate statehood until 1905. In July of that year delegates from the Five Nations met at Muskogee in what is known as the Sequoyah Convention. This body formed a State constitution for the state of "Sequoyah" but Congress refused to recognize its work so the convention came to nothing except that the leaders in this movement were later prominent in the convention that made the Oklahoma constitu-

tion. After much debate the Joint Statehood Bill, or Enabling Act, was at last passed by Congress and approved 16 June 1906. It provided that Oklahoma and Indian Territory should be admitted as one State, provided such union were approved by both Territories. The union being approved the 112 delegates provided for by the Enabling Act met at Guthrie 20 Nov. 1906 and proceeded to draft a State constitution. Some of the radical features of this instrument caused the convention several times to come into conflict with President Roosevelt. Ninety-nine of the delegates were Democrats and bitter clashes came over the attempts to introduce a "Jim Crow" clause. William H. Taft in a speech delivered at Oklahoma City 24 Aug. 1907 criticized the constitution very severely and strongly advised its rejection. It was adopted, however, at a special election held 17 Sept. 1907 by a vote of 180,333 to 73,059 for rejection. Prohibition which was submitted as a separate provision was accepted by a vote of 130,361 to 112,258. At the same election State and county officers were chosen. The Republicans had nominated the Territorial governor, Frank Frantz, as their candidate for State governor. The Democrats had nominated Charles N. Haskell. Haskell was elected and of the five Representatives in Congress four Democrats and one Republican were elected. Saturday, 16 Nov. 1907, President Roosevelt proclaimed Oklahoma the 46th State of the Union. On that day Governor Haskell and the other State and county officials assumed office. The legislature was Democratic and Robert L. Owen and Thomas P. Gore were chosen as United States senators. In the Presidential election of 1908 Bryan received 122,406 votes, Taft 116,558 and Debs 21,729. Gore was re-elected to the Senate in 1909. At the primary election of 1910 the so-called "grandfather clause" amendment to the constitution was adopted. This was declared unconstitutional by the Supreme Court of the State and later by the United States Supreme Court in 1915. The Enabling Act had made Guthrie the capital until 1913 but at an election held in 1910 it was voted to remove it to Oklahoma City. This gave rise to litigation in the courts and the Supreme Court of the United States decided that the part of the Enabling Act fixing the location of the capitol at Guthrie was unconstitutional. In November 1910 the Democrats elected their candidate, Lee Cruce, who received 120,218 votes as compared with 99,527 for the Republican candidate, Joseph W. McNeal. The Republicans, however, elected an additional representative in Congress, giving them two, while the Democrats had three. The census of 1910 gave Oklahoma 1,657,155 in population. This entitled the State to eight representatives in Congress so three more, all Democrats, were elected at large in 1912. In the Presidential election of 1912 Wilson received 119,156 votes, Taft 90,786 and Debs 42,262. Owen was returned to the Senate, as a Democratic legislature was elected. In November 1914 the Democrats elected Robert L. Williams as governor by a vote of 100,597 as compared with 95,904 for the Republican candidate, John Fields. Gore was again elected to the Senate. In 1916 Wilson received 148,115 votes and Hughes 98,299. In 1918 the Demo-

crats nominated and elected as governor J. B. A. Robertson, who received 104,132 votes. The Republican candidate, H. V. McKeever, received 82,865. Owen was again returned to the Senate. Oklahoma has eight Representatives in Congress. The governors of Oklahoma have been as follows:

J. S. BUCHANAN,

Dean of the College of Arts and Sciences, University of Oklahoma.

OKLAHOMA, University of. A State coeducational institution for higher education, established at Norman, Okla., by the First Territorial legislature in 1890. It was opened to students in September 1892. It is supported by biennial appropriations of the State legislature and also from an income on public lands that were set aside when the various Indian reservations were opened to settlement. Section 13 in each township in the greater part of old Oklahoma Territory was set aside for institutions of higher learning and the proceeds from leasing the lands or sale is divided between the university, the Agricultural and Mechanical College and the normal schools. The Statehood Bill gave to the university about 250,000 acres of additional land in 1906. This with one-third of section 13 makes a large land endowment which is supplemented by direct appropriations. The legislature of 1919 appropriated \$1,800,000 for the next two years.

The university comprises the following colleges and schools: Graduate School, College of Arts and Sciences, with schools of education, journalism, public and private business, social service, home economics, fine arts, law, medicine, pharmacy, engineering.

There is a campus of 120 acres with seven large fire-proof buildings valued at over \$1,000,000. There is a faculty of 208 instructors and an enrolment of 3,408 students. Tuition is free to residents of Oklahoma. In 1922-23 the institution's property was valued at \$2,413,312.14, and its income was \$949,252. The library contains 45,000 volumes.

ADMINISTRATION HALL, UNIVERSITY OF OKLAHOMA, NORMAN, OKLA.

OKLAHOMA AGRICULTURAL AND MECHANICAL COLLEGE, a coeducational State and Federal institution founded at Stillwater, Okla., in 1891. It offers courses in agriculture, mechanic arts, military science, domestic science and teaching, with corresponding instruction in mathematics, physics, English, philosophy, history and other subjects and awards the degrees B.S. and M.S. There is a secondary school to which pupils from the eighth grade are admitted and which prepares for the college course. The college owns a 1,000-acre farm, has an 80-acre campus, substantial brick buildings and adequate equipment. Its income is derived from State and Federal funds and from its allotment of public lands. Tuition is free. In 1922-23 the president was James B. Eskridge, Ph.D.; the number of instructors was 113 and students, 3,100. The library is an excellent one. The value of the buildings and equipment is about \$2,133,779 and the annual income is about \$741,850.

OKLAHOMA CITY, the capital of the State of Oklahoma. It is also the county-seat of Oklahoma County and is situated on the north branch of the Canadian River and on the Atchinson, Topeka and Santa Fe, the Chicago, Rock Island and Pacific, the Saint Louis and San Francisco, the Missouri, Kansas and Texas, and the Fort Smith and Western railroads. It is the commercial and industrial centre of a productive agricultural and stock-raising region. It has a large number of wholesale houses. The chief manufacturing establishments are cotton mills, flour mills, box and cracker factories, patent medicine factories, iron works, soap factories, wood work shops, packing-houses, oil refineries and cottonseed-oil mills. It has an extensive trade as it is the distributing centre for a large region; and the grain, cotton and livestock of the surrounding country is mostly shipped from Oklahoma City to Eastern and Southern markets. The city is the seat of the Oklahoma City College, and Saint Mary's Academy. It has public and parish schools and a Carnegie free public library. There are a number of church buildings, the State University and Saint Anthony's hospitals. The city has a number of banks, with a large combined capital. Oklahoma City was settled 22 April 1889 by 3,000 men who came on railroad trains and horseback from the Territory line, after noon of said date, when by proclamation the country was declared open to settlement. It was incorporated July 1890 and chartered as a city April 1891. The government is vested in a mayor and four commissioners elected for a four year term. The city owns and operates the waterworks. The population is nearly all American-born white people, about 2 per cent are negroes and 3 per cent Indians. Pop. (1920) 91,259.

OKLAHWA ("crooked water"), a river in central Florida which rises in the central part of the State, flows almost due north for about 80 miles, turns abruptly and flows east into the Saint John about 20 miles south of Palatka. It is about 200 miles long. It is narrow and crooked but is navigable for launches and steamers for nearly its whole length.

OKMULGEE, òk-mŭl'gē, Okla., town and county-seat of Okmulgee County, 44 miles

southwest of Muskogee, on a fork of the Canadian River and on the Saint Louis and San Francisco Railroad. Its courthouse is a stone building formerly the capitol of the Creek Indian government. There are good schools, a hospital and the commission form of municipal government. There are roller-mills, cotton and cottonseed-oil industries and glass manufactures. The surrounding district is rich in coal, oil and gas. Pop. (1920) 17,430.

OKOLONA, ò'kō-lō'nā, Miss., town and county-seat of Chickasaw County, 68 miles south of Corinth, on the Mobile and Ohio Railroad. It is the seat of the Okolona High School and college and owns a modern lighting plant and waterworks. The district raises cotton, corn and stock and there is a considerable lumber industry. Pop. (1920) 3,852.

OKOTSK, ò-kōtsk', Sea of, an extensive inlet of the north Pacific Ocean, indenting the eastern coast of Russian Siberia. It is bounded on the north by Siberia, is separated from the ocean on the east by the Kamchatka Peninsula and is partially enclosed by the Kuril and Urup islands on the east and southeast and by the island of Saghalin on the southwest. It is connected with the Sea of Japan by the La Pérouse Strait between Saghalin and Yezo islands and also by the long passage between Saghalin and the mainland which broadens out into the Gulf of Tartary. The sea is about 1,000 miles in length and 600 miles wide, is nearly rectangular in shape and its northern shore nearly follows the 60th parallel N. The coasts are steep, good harbors are few and these are generally icebound from November to April. The open sea is often fogbound and subject to heavy storms and consequently is little frequented.

OKRA, a plant (*Hibiscus esculentus*) of the mallow family, native of Africa, commonly grown for its long pods. These are used as a vegetable, especially, because of their mucilaginous texture, to give body to soups, stews and catsups. The plant is a tall, rough annual with flowers similar to those of the cotton plant. It is extensively grown in the southern United States and to a less extent northward.

OKU, ò'kū, **Yasukata**, COUNT, Japanese soldier: b. province of Chikuzen, Fukuoka Prefecture, 3 Nov. 1846. He entered the army in 1871 and was a major in the Imperial forces during the Satsuma Rebellion in 1877. He attained rank as lieutenant-general in 1894 and in the war with China commanded the Fifth Army Division. For services at the battle of Newchwang he was created baron. He received the rank of full general in 1903 and in the Russo-Japanese War, 1904-05, he commanded the Second Army. He rendered distinguished service at Nanshan, Telissu, Kaiping and Newchwang, Ta-shih-chao, Liaoyang, Shaho and Mukden. He was awarded the First Class Order of the Golden Kite and the Grand Cordon of the Rising Sun; was appointed chief of the general staff and member of the Supreme Military Council, succeeding General Viscount Kodama in 1906; and in 1907 he was created count.

OKUBO, ò'kū-bō, **Toshimitsu**, Japanese reformer and statesman: b. in the province of Satsuma 1830; d. Tokio, 14 May 1878. He

displayed from childhood evidences of great ability. He was special adviser of the Prince of Satsuma, who was the great exponent of the restoration of the Mikado to supreme power. His political sagacity was amazing. From the first he penetrated the designs of Russia in the Far East and for this reason, after his return from Europe in 1872, he opposed the war with Korea, knowing that temporary success, before Japan was modernized, would simply be playing into Russia's hands. It was Okubo's manifesto in 1868 that brought the Mikado from palace seclusion behind the screen of mystery into public life, and removed the capital to Tokio. From 1870 until his death he was the most powerful minister in the Imperial cabinet, and the personification of energy and progress. As special envoy to China in 1874 he settled the Formosa episode. The suppression of the Satsuma Rebellion in 1877 settled Okubo's policy as the permanent one for Japan. He was assassinated 14 May 1878 by six of his own clansmen but received posthumous honors from the emperor. Consult his life by Maurice Courant (Paris 1904).

OKUMA, ōk'oo-mā, **Shigenobu**, Japanese statesman: b. at Saga, in the province of Hizen, 1837; d. Tokio, 10 Jan. 1922. He became an advocate of advanced reforms, the abolition of the feudal system, the restoration of the emperor to power and a new system of education; and his persistent and courageous advocacy was influential in bringing about the revolution of 1867-68. After the reorganization of the Japanese government he was appointed to a position in the Foreign Office, and in 1872 was made Minister of Finance, in which position he brought the national finances into order and established a national currency. In 1881 he withdrew from office and organized the Progressive party, which urged that a constitutional government be immediately organized, and that the ministry be subordinated to the Parliament, of which he was the recognized leader during his political career. After the Japanese parliament was established, he became Minister of Foreign Affairs, but his liberal attitude toward the revision of the treaties with foreign countries aroused so much popular opposition that he retired from office. In 1896 he was for a short time in the cabinet, and in 1898 organized a cabinet of which he was Premier; but he resigned within a few months and retired from public life. After his withdrawal from office in 1881, he founded the Semmon-Galko, a school for the study of law, literature and political economy. In 1907 he resigned leadership of the Progressive party. He advocated higher education of women.

OLAF, ō'lāf, **Saint**, king and patron saint of Norway: b. 995; d. Sticklestad, Norway, 1030. He was a great-grandson of Harald Haarfager, a son of Harald, chief of the district of Gränland. He early made himself famous by his military expeditions to England, successfully assisting King Ethelred against the incursions of the Danes. After the death of Eric and the expulsion of his son, Olaf caused himself to be proclaimed king. He began his reign by introducing a special court of law called the Hirdskra, and restored the ancient boundaries of Norway and Sweden, but above

all he was a zealous supporter of Christianity and may indeed be called the real converter of Norway. The severity which he employed for this purpose afterward exposed him to a formidable retaliation at the hands of his own subjects. Having engaged in war with Canute the Great, king of England, he allied himself with King James of Sweden, but was so completely defeated in battle that he fled to Sweden and Russia. In 1028 he was induced by a dream to return to Norway, where he found the people so alienated from him that he could only bring 3,000 men into the field to oppose the forces of the mighty Canute. The armies met at Sticklestad near Drontheim, in 1030, and Olaf lost both the battle and his life. His body was buried in the cathedral of Drontheim, and he has since 1164 been honored as the patron saint of Norway. His feast day is 29 July. Many legends respecting him are current throughout the North, and his name has been given to an order of knighthood founded by King Oscar I in 1841 as a reward for services to king and country, art and science. Consult Longfellow's poem, 'The Saga of King Olaf' (1863).

ÖLAND, ē'länd, an island in the Baltic Sea, owned by Sweden and lying off the southeastern extremity of that country, separated from the mainland by Kalmar Sound, a strip of water from five to 15 miles broad. The island is 85 miles in length and 10 miles in breadth at its widest point. The area is 519 square miles. There is a ridge of limestone along the west side and much of the island is sandy and barren. There are, however, some well-wooded hillsides and the narrow coast land is productive. There are several small streams and a lake, Horusjö, about three miles long. Barley and sandstone are the principal exports, and fishing and navigation constitute the chief occupations of the inhabitants. The principal town and capitol is Borgholm, a watering resort on the west side of the island, and here are ruins of a castle dating the 13th century, later remodeled into a palace, and now one of the most famous ruins in Sweden. In Scandinavian history Öland appears frequently as a battleground between Denmark and her northern neighbors. It was at one time self-administered but in 1824 was united with the Län of Kalmar.

OLATHE, ō-lā'thē, city, county-seat of Johnson County, Kan., on the Atchison, Topeka and Santa Fe, the Saint Louis and San Francisco, the Missouri, and the Kansas City, Clinton and Springfield railways, about 22 miles southwest of Kansas. It is in an agricultural and stock-raising region. The chief manufactures are flour, furniture, shoes, brick and agricultural implements. The State institution for the deaf and dumb and a Carnegie library are located here. The city owns and operates the waterworks. Pop. (1920) 3,268.

OLBERS, ōl'bērs, **Heinrich Wilhelm Matthäus**, German astronomer: b. Arbergen, near Bremen, 11 Oct. 1758; d. Bremen, 2 March 1840. He studied medicine at Göttingen in 1777-80 and at the same time pursued Kaestner's course in mathematics. He engaged in the practice of medicine at Bremen in 1781, practising continuously until 1823, and devoting the nights to his astronomical investigations. In 1779 he devised a method for determining the orbit of a comet

which is still in use by astronomers and known as "Olbers's Method." It was described by Baron von Lach 'Ueber die leichteste und bequemste methode dië Bahn eines Cometen zu Berechnen' (Weimar 1797). He was especially interested in comets and in the minor planets. He rediscovered Uranus, supposed to be a comet, in 1781; confirmed the identification of Ceres in 1802; discovered Pallas later in that year and Vesta in 1807. He discovered many comets, most of them, however, being first detected at Paris; but that of 1815 bears his name as the original discoverer. His hypothesis of the origin of comets was later disproved; but his observations, notes and calculations remain of high value. Besides the publications by Baron von Zach, his papers were published in the 'Jahrbuch of Bode' (1782-1829); and of Encke (1832). His collection of books relating to comets is in the Pulkowa Library. Consult Schilling, C., 'Wilhelm Albers, sein Leben und seine Werke' (3 vols., 1894-1900).

OLCOTT, òl'kòt, Eben Erskine, American mining engineer: b. New York, 11 March 1854. He was educated at the College of the City of New York and at Columbia University. He engaged in practice as a mining and metallurgical engineer in the Western States, Mexico and South America and later became president of the Hudson River Day Line and the Mary Powell Steamboat Company. He is interested in railway transportation in the Catskills, is a director in several New York banks and in 1901-02 he was president of the American Institute of Mining Engineers. He inaugurated the movement for the Hudson-Fulton celebration in New York in 1909 in honor of the Hudson ter-centenary and the Fulton centennial.

OLCOTT, Henry Steel, American theosophist: b. Orange, N. J., 2 Aug. 1832; d. Adyar, India, 17 Feb. 1907. He was educated in the University of the City of New York and in 1858-60 was agricultural editor of the New York Tribune. In 1863-66 he was special commissioner in the United States War and Navy departments and was admitted to the bar in 1866. He was one of the founders in 1875 of the New York Theosophical Society, and was its president. He edited the *Theosophist* (1879-1907) and in recognition of his services to Hindu philosophy received the unique honor of the sacred thread of the Brahman caste. In 1878 he was appointed by President Hayes to report on the trade of the United States and India. He and Mrs. Annie Besant (q.v.) founded the Central Hindu College at Benares, and with her he lectured throughout India and Ceylon. In his later years he lived at Adyar, in the province of Madras, India. He published 'Sorgho and Umphree' (1857); 'People from the Other World' (1875); 'The Buddhist Catechism' (1882); 'Theosophy, Religion and Occult Science' (1885); 'Posthumous Humanity' (1887); and 'Old Diary Leaves' (1895-1903).

OLD AGE, Diseases of. The human body reaches its complete development about the 30th year. About this time the lungs attain their maximum respiratory capacity, the heart reaches its maximal normal growth and the brain is heaviest. Growth in stature ceases between the 20th and 25th year but this is due to the downward pressure upon the spinal

column when the body is in the erect position, the unequal thicknesses of the discs between the vertebrae forcing the spinal column into curves. In every other direction skeletal growth continues until about the 30th year and about this time the individual requires the largest hat, shoes and gloves and he has the largest chest measurement. At this time the body is in its most perfect physical condition.

Causes of Old Age.—Aging begins soon after the period of development has been completed. Diminution in respiratory capacity has been demonstrated between the 35th and 40th year, the average weight of the brain is less at 40 than it is at 30 and the normal blood pressure begins to rise about the 40th year. This rise in blood pressure indicates that the arteries are beginning to lose their elasticity and the heart must send the blood through the arteries with greater force to maintain the circulation. The greater demands made upon the heart are met by an increase in the thickness of the walls whereby the propulsive force of the heart is increased. The organs and their functions continue however to maintain their harmonious relations with allied organs and functions, and a state of stable metabolism, in which the waste of tissue is counterbalanced by the repair, continues to exist for about 30 years. This is the period of maturity. Toward the end of this period objective and subjective manifestations of aging appear but not until the end does functional impairment become marked. Fast living and the neglect of the physiological needs of the body, as excessive work and insufficient sleep, improper food, unhygienic surroundings, etc., will hasten the period of maturity and shorten it, and the person will look old, feel old and his tissues will present the senile changes in the fifth or sixth decade of life.

The popular conception of old age is based upon the years of life and the objective manifestations, the appearance. There is, however, not one of the many objective manifestations of old age that is distinctively senile. Gray hair and baldness, wrinkles, tanned, dry skin, thin, shrunken features, falling out of the teeth, dull expression, general body waste, mental decay, and other objective features of old age may appear in earlier life, either as the result of disease or due to physiological causes or unknown causes.

The individual conception of old age is based upon the subjective manifestations, the feelings; but so repugnant is the idea of aging to most persons that when the manifestations appear they will be ascribed to any other possible cause than aging. Shortness of breath due to diminished respiratory capacity will be called asthma; the aches and pains in the joints due to hardening of the ligaments and cartilages and senile changes in the joints themselves will be ascribed to rheumatism; malaria will be held responsible for the more rapid fatigue and the tendency to fall asleep during the day. Impaired vision, diminished virility, forgetfulness, vertigo, even prostatic troubles which are purely senile, will be ascribed to accidental disease and not to advancing age.

The scientific conception of old age is based entirely upon the condition of the organs and tissues. As there is no regularity in time, ex-

tent or order in which the organs and tissues undergo the senile changes a person may be physically aged before he is old in years while another of advanced age may show few of the senile changes. Precocious senility, too early aging, is becoming more prevalent, especially in busy commercial centres where excessive activity, mental strain, unnatural sensory impressions as loud noises, artificial light, peculiar flavors employed in cooking, the exceedingly rapid and fine vibrations of the present day motor vehicles, cause rapid degeneration of the organs and tissues that have been excessively employed. Insufficient sleep and incomplete elimination of waste contribute to the rapid degeneration by preventing complete repair. This explains the frequency of cardiac, renal and cerebral diseases in the sixth decade of life, these diseases causing the most deaths during this period.

Senile Changes.—The earliest demonstrable senile change occurs in the respiratory capacity of the lungs. Hypertrophy of the heart may appear earlier but this is pathological and is almost always due to violent athletics during the period of development. The diminished respiratory capacity is caused primarily by the deposit of dust in the air vesicles and lung tissue. Fine dust in the inspired air is deposited in the lungs from birth but the increase in the size of the air vesicles during the period of growth overcomes the diminution of the aerating surface that is being covered by dust. The deposit of dust continuing after the limit of growth has been reached, the aerating surface is continually being encroached upon and the amount of inspired and expired air constantly diminishes. At the age of 30 the average amount of carbonic dioxide is about 1,340 cubic inches an hour. This is reduced to about 1,000 cubic inches at the age of 60 and it may fall to 700 cubic inches or less at the age of 85. The dust not alone covers the interior of the air cells, but fine particles work through the walls of the cells and remain embedded in the lung tissue, producing *Pneumokoniosis*. As a result of this deposit the lungs which are pink in infancy become dark and marbled or mottled, the color depending upon the amount and character of the dust deposit. In comparatively dust-free localities the lungs of aged persons are dark gray; in agricultural districts they are dark greenish or bluish; in smoky or sooty sections they are gray-black or brown-black. Two other factors aid in diminishing the respiratory capacity of the lungs. Owing to the senile changes in bone and cartilage the chest walls become rigid and prevent the complete expansion of the lungs; and owing to impaired nutrition due to impaired blood and defective circulation when the blood vessels degenerate, the walls of the air cells waste producing *Senile Emphysema*. Violent respiratory efforts as in coughing will have the same result, the walls breaking instead of wasting away slowly. The air cells coalesce and where there were many small cells, each containing aerating walls, there will be a few large cells with the aerating partitions removed. Senile emphysema causes no distress during quiet breathing but slight exertion will cause dyspnoea and an effort to take deep breath will bring on a spasmodic cough. Violent exertion as in running will cause rapid

and extensive emphysema which will seriously interfere with the respiration.

The immediate result of diminished respiratory capacity is impaired oxygenation of the blood. Less air being inhaled less oxygen is available for interchange with the carbonic dioxide which is to be eliminated. The blood retaining part of the impurities which should have been removed in the lungs, its carrying capacity of nutrition to the tissues and of waste from the tissues is impaired. This is one of the ultimate causes for the senile degeneration of the tissues. Incomplete aëration is at first partly overcome by more rapid respiration, the respiratory rate at the age of 30 being 16 per minute, rising to 18 per minute at the age of 50, and it may rise to 20 per minute later. This rapid respiration causes fatigue and waste of the muscles of respiration and the respiratory rate is automatically lowered and the periods of rest between inspiration and expiration are lengthened. This prevents too rapid muscle waste but the impairment of the blood proceeds more rapidly. Several other factors contribute to the impairment of the blood. A number of causes combine to weaken the propulsive power of the intestines and retard the passage and expulsion of the fecal mass and thus constipation is produced. The fecal mass remaining too long in the intestines, it decomposes and the decomposition products are absorbed and carried in the blood. (See *AUTOINTOXICATION*). Leucomaines, tissue waste products, are likewise retained and owing to degeneration of the kidneys part of the urea which should be eliminated by the kidneys is retained in the blood. The entire quantity of blood in the body is diminished, and there is usually a larger proportion of calcium salts than in earlier life. In consequence of these changes in the blood, it becomes denser and more viscid and it passes through the capillaries and other fine tubes with greater difficulty. The tissues receiving an insufficient and perverted blood supply are improperly nourished and they degenerate.

We have traced here one of the many factors responsible for the production of the senile changes. This factor becomes operative with the first breath that the new-born child takes and it continues with increasing force throughout life. The production of pneumokoniosis has been advanced as the basic cause of aging but the extent of the pneumokoniosis bears no relation to the extent of the senile changes and persons have been found who exhibited marked senile changes at a comparatively early age in a fairly dust-free atmosphere. Several auto-intoxication theories have been advanced, the one advanced by Metchnikoff being the best known. There is the same objection to these that there is to all theories confining the basic cause to a single factor. They all fail when put to the test of universal application. The only theories of aging that have not been absolutely disproven are those that place the basic cause of aging in some characteristic of the cell. Better appliances than those at present at our command, especially more powerful microscopes, and a better understanding of the chemical and perhaps physical processes that are engaged in the production and maintenance of life, will probably reveal the intrinsic factor in the cell that causes it and the tissue

which it forms to undergo the changes that we call aging.

In tracing the causes of aging with a view to minimizing them, more importance has been attributed to the condition of the blood vessels than to the condition of the blood itself. (See ARTERIOSCLEROSIS). The arteries degenerate early, the usual form of degeneration being a hardening of the vessel. In many cases the earliest change is *Atheroma*, a fatty degeneration in which the vessel is softer than normal but the elasticity of the vessel is diminished as in arteriosclerosis and the heart must exert increased propulsive force to send the blood through the body. There is consequently both in hardening and in softening of the vessels increased blood pressure. (The terms Arteriosclerosis and Atheroma are often used interchangeably although they refer to different conditions of the vessels).

Senile degeneration of the vessels is due to three causes acting either independently or together. The impurities in the blood cause localized irritation and inflammation of the lining membrane of the vessel, producing an inflammatory degeneration. Owing to the insufficient and perverted blood supply the waste of muscular fibres in the arterial walls is not completely repaired but is replaced by a growth of fibrous tissue which requires a smaller blood supply. This nutritional degeneration is the ordinary form of senile degeneration of the tissues. A mechanical degeneration results from the continual contraction and expansion of the muscular fibres (nearly 100,000 times a day), these fibres when insufficiently nourished losing their tone and elasticity. The three factors are active in varying degrees in every senile case.

Fibrosis, the increase in fibrous tissue, replacing the waste in other tissue, is a distinctively senile phenomenon. The new growth does not always fill the space of the waste tissue and the manner of its growth sometimes produces most pernicious results. In the spleen the fibrous tissue forms bands which compress the spleen substance causing it to waste and in crossing blood vessels the bands may compress a vessel, occluding it and depriving of nutrition the part which it is to supply. In the bladder the fibrous tissue forms bands across the interior of the walls and the weakened walls bulge out between the bands and form pockets. Urine collects in these pockets and may remain for days, decomposing and producing *cystitis*. In the solid organs like the kidneys, liver, lungs, brain and glandular organs, the fibrous tissue growth compresses the organ and interferes with its functions. The only notable exception to this is the prostate gland which is frequently enlarged in old age. The heart is usually enlarged but this is not a senile change and the fibrosis does not diminish its size to an appreciable degree. The true senile degeneration called *Brown Atrophy*, in which the heart is smaller, denser and shows extensive fibrosis, is very rare.

Fibrosis occurs early in degeneration of the arteries. Late in life calcium deposits occur and in very rare cases there is complete calcification of the vessel and the so-called pipe-stem artery is produced. In the inflammatory degeneration the lining membrane becomes thickened and in small vessels this thickening may completely ob-

literate the lumen of the vessel. Where this happens the part beyond the occlusion is deprived of nutrition and unless a fresh blood supply is rapidly obtained through collateral circulation *senile gangrene* follows. There are few diseases due directly to the degenerated arteries, the pernicious effects of arteriosclerosis being mostly the secondary effects produced in organs and tissues that receive an insufficient blood supply. Directly due to arteriosclerosis are *Angina Pectoris* or neuralgia of the heart which is ascribed to degeneration of the coronary artery; *abdominal crises*, neuralgic attacks in the abdomen ascribed to arteriosclerosis of the abdominal aorta; *Charcot's claudication*, a painful cramp of the legs with sudden lameness, ascribed to arteriosclerosis of the femoral artery. *Cerebral apoplexy* due to cerebral hemorrhage follows rupture of a cerebral vessel which has degenerated. In the case of *aneurism* which is due to degeneration of the vessel, the degeneration is almost always a sequel of syphilis and is not due to the senile changes. Arteriosclerosis may be due to other causing than aging and it will produce the same conditions as the senile degeneration.

The loss of elasticity of the vessel is partly overcome by the increased force with which the heart propels the blood but the force is partly dissipated and lost in the more distant parts of the body, especially in the fine vessels supplying the organs. The heart responds to the diminished propulsive force of the vessels by increasing its own and this is accomplished by a gradual thickening of its muscular walls. There is in earlier life a wide margin of safety between the ordinary activity of the heart and the limit of its functional capacity. After the heart has reached the limit of its overgrowth further excessive demands upon it reduce the margin of safety until the limit of its functional capacity is reached. The progressive degeneration of the vessels necessitates ever-increasing work of the heart and finally, when the limit of its functional capacity is reached, it can no longer respond. The heart may then become paralyzed and sudden death ensues. More often the heart muscle loses its tone, it expands and cannot contract completely, the walls become thinner and the cavities enlarge. *Cardiac dilatation* is an extremely grave condition in old age. Even slight exertion will suffice to cause spasm or paralysis of the organ or after a few moments of excessive activity it becomes so weak that it cannot propel the blood to the brain. The brain being deprived of nutrition it and the cranial nerves become inactive and paralysis of the vital centres results. This is probably the most frequent mode of death in old age.

The pernicious effects of tissue starvation caused by impaired circulation and depraved blood are found in every organ and tissue. The organic matter of the bone wastes and the bones become brittle and fracture easily. The head of the femur gradually becomes depressed until it forms a right angle with the shaft and owing to the brittleness of the bone even a slight jar will suffice to produce a fracture at the neck between the head and the shaft. On account of the loss of organic matter fractures do not heal readily in the aged. In the chest the intervertebral discs become hard and in extreme old age they may ossify.

The same thing happens to the cartilages by which the ribs are attached to the spinal column and to the sternum, the sternum and the ribs become hard and lose their resilience and the whole bony chest wall becomes a rigid box which interferes with the expansion of the lungs. Late in life bone substance itself wastes. A notable example of this is seen in the lower maxilla after the alveolar process, in which the teeth are implanted, has wasted. The waste of the lower jaw gives to the senile face its weak and weakened appearance.

The aches and pains in the joints from which the aged frequently suffer and which are generally called rheumatism, and often treated as such, are due to *arthrosclerosis* or hardening of the joint. The ligaments and cartilages harden, the synovial sacs, the water pads between the ends of the joints, become dry and the articular cartilages covering the ends of the bones waste through attrition. *Rheumatoid Arthritis* or *Arthritis deformans* in which the joint becomes immobile and the part, generally the hand, becomes deformed, occurs almost exclusively in middle aged and elderly persons. This condition, for which many causes have been assigned, is probably only an extreme senile change in which the ligaments contract as well as harden. In rare instances the ossification of many or nearly all the joints will occur, as happened in the case of the celebrated ossified man exhibited a few years ago.

Muscle wastes and the waste is either not replaced at all or it is replaced by fibrous tissue or fat. The fat either accumulates between the muscle fibres producing *fatty infiltration* or it invades the muscle cells producing *fatty degeneration*. The fatty change in muscle is pathological and occurs when the blood supply is insufficient for fibrous tissue growth. Fatty degeneration is, however, the normal senile change in brain and marrow. A fat deposit upon the abdomen is usually looked upon as an early sign of aging. This may appear early through inactivity and it may be absent in persons who are active, especially if they do much stooping. Late in life the fat disappears.

In old age the diaphragm becomes flaccid and the folds of peritoneum which hold the abdominal organs in place become loose, permitting a *ptosis* or sinking of the organs in the abdominal cavity. Owing to the waste and atony of the muscular fibres of the stomach this organ becomes dilated and its contractility is lessened and owing to the waste of the secreting glands digestion is slower and food remains longer in the stomach. For these reasons the generally accepted "little and often" rule for feeding the aged is irrational. The intestines in old age become dilated, the walls are weakened and the whole mass of bowels sinks. The transverse colon sinks at the centre but it is fixed at the hepatic flexure on the right and the splenic flexure at the left and these two bends often form kinks which interfere with the free passage of feces. This is a contributing cause for constipation, the most frequent ailment among the aged. In many cases the rectum becomes dilated until it forms an immense pouch in which feces accumulate for days.

Aside from a diminution in the amount of

bile secreted there is apparently little change in the functions of the liver. The bile remains longer in the gall bladder than in earlier life and it becomes thicker, often forming *cholestrin gall stones*. Such gall stones are frequently found after death though they gave no evidence of their existence during life. They are, however, softer and not as jagged as the pathological stones which give the severe symptoms in gall stone colic. The changes in the kidneys differ from all other senile changes inasmuch as the fibrosis begins at birth and is progressive until impaired nutrition occurs. Thereafter the fibrosis which until then was confined to the space between the apices of the pyramids invades the deeper tissues. In its gross appearance the senile kidney resembles the kidney in *interstitial nephritis* (Bright's disease), but the lining membrane of the tubules and loops show no change and the functional impairment is slight. Less urea and other normal substances are eliminated but there is little or no albumin in the urine and no casts are found. Many pathologists do not differentiate between the senile kidney and the kidney of nephritis and report all kidneys showing the gross changes as nephritis. The failure to differentiate between the two accounts for the number of nephritis cases found at autopsy that gave no symptoms of the disease during life.

Were it possible to examine the kidney during life it would be possible to determine the extent of the senile changes from the extent of the fibrosis. At present we have no standard or basis upon which we can estimate the extent of the senile changes. The blood pressure which is generally employed to determine the extent of the arteriosclerosis is uncertain as there are many other causes for high blood pressure beside arteriosclerosis and a low blood pressure can exist in the presence of arteriosclerosis. A more reliable estimate of the extent of the senile change can be formed from the condition of the sternum. The *ensiform appendix*, the lowest part of the sternum, is cartilaginous in early life and it begins to ossify from above downward during maturity. Normally the ossification does not reach the tip until very late in life. In early and rapid aging this appendix ossifies early and rapidly and it may be completely ossified before the 60th year. Ordinarily the ossification extends down about two-thirds of its length at the age of 60 and below this it has the soft resilient feel of cartilage.

Mental Change.—The mental changes in advanced life proceed independently of the physical changes although the degeneration of the blood vessels and the impairment of the blood affect the nutrition of the brain and its functions. Brain power may show evidences of impairment before there is any evidence of physical change and on the other hand certain faculties continue to improve in their capacity for two decades or more after the brain begins to lose weight. The faculty of memory, however, begins to lose in power before the brain has reached its complete development.

Forgetfulness of names and dates is usually the first symptoms of senile impairment and this may attract the person's attention during the fifth decade of life. Long before this is noticed the individual unconsciously avoids tasks which demand excessive employment of

this faculty. The diminishing power to receive and store impressions and ideas does not make the sharp impression upon the mind as does the diminishing power to recall. He may have been able to learn a new language in a few months in youth and now he finds that he cannot retain a few new words notwithstanding frequent repetition, and unless compelled by necessity he loses interest in the new language and makes no further effort to learn it. Formerly he may have been able to recall at will a tune heard weeks before; now a new tune will make a momentary pleasant impression but unless a conscious effort is made to retain it, it is soon forgotten. In old age a conscious effort must be made to retain impressions which formerly impressed themselves automatically and a conscious effort must be made to recall them. The difficulty in retaining new impressions is due partly to degeneration of the sensory end organs. The lens of the eye flattens and hardens in old age producing *presbyopia*, the far-sightedness of the aged. Objects close by become blurred and the eye does not adapt itself rapidly to see objects at varying distances. The visual impressions are therefore indistinct and they are not received as clear images which the memory will retain. The drum of the ear either hardens forming *otosclerosis* or it wastes and becomes perforated. In either case the sound waves produce an abnormal impression upon the terminals of the auditory nerve and *presbycusis*, partial or complete deafness, results. In the nose the Schneiderian membrane wastes and the sense of smell is impaired and may be entirely destroyed. The taste buds degenerate and the sense of taste is impaired and the aged person wants sharp, spicy, sour, salty or sweet food. The sense of touch and feeling is likewise impaired in old age and persons are less sensitive in touch and in the appreciation of surface pain. They are more apprehensive but surface sensation is actually diminished. The seeming fortitude of aged persons to endure pain is explained by diminished local sensation and weakened mental power to appreciate it. For this reason diseases like pneumonia, peritonitis, pleurisy, gastritis, in which pain is an early symptom, are often neglected until the disease is far advanced and is recognized by other symptoms.

As the mind becomes progressively dulled to impressions obtained through the sensory organs the impressions of mild sensations become evanescent and only powerful impressions, or those to which the mind is specially directed, are retained.

Difficulty in absorbing and retaining new ideas is often an early sign of mental aging. A person finds that where formerly a single reading of a book left a clear mental picture he must now read a paragraph several times and make a conscious effort to understand its import. For the same reason he cannot follow a play which has a complicated plot. The aged person falls asleep at the play, sermon or lecture because the ideas projected come faster than he can assimilate them and the effort to follow them causes brain fag and mental exhaustion. Brain fag sets in more rapidly with advancing age and in many cases the quantity of work done, rather than the quality, is the indication of the extent of the

mental impairment. Writers who could work for hours without intermission must now take frequent rests. If they continue after brain fag sets in, mental confusion follows and this ends in complete mental exhaustion and the mind becomes a blank. The power of imagination becomes weakened, new ideas do not arise as readily and the writer is often unable to find the appropriate word or phrase to express his ideas. It is sometimes possible to detect in the work of an aged writer at what points brain fag set in by the deterioration of the character of his work.

Judgment and reason may remain unimpaired but the mind works more slowly and becomes sooner exhausted. Judgment is, however, readily affected by the emotions and the aged lose control over their emotions. Intense joy or sorrow lasts but a moment and is soon forgotten yet they will weep where there is but little occasion for grief and they will laugh over trivialities. Fear and hatred will often arise without adequate cause and will persist long after the cause is forgotten. Love is never intense and where it appears as a new emotion in an old man toward a young woman the sexual and egotistic elements predominate over the spiritual element. In most cases where remarkable mental ability has been retained in old age close observation revealed a deterioration of all the faculties except the one upon which all the mental power of the individual had been concentrated. The mental ability in this one direction became so prominent that the deficiencies in other directions were overlooked.

The mental attitude of the aged person who has nothing to occupy his mind but his body and his fate is a dull, hopeless resignation to the inevitable. Retrospection brings regrets, the contemplation of the future arouses a haunting dread and the mind is concerned only to preserve the body in the best possible condition to prolong life. If the mind is occupied with serious work which necessitates the whole attention of the individual he is cheerful, hopeful and ambitious. The neglect to furnish aged inmates of institutions with occupations which will keep the mind from self and death is responsible for the generally depressed air of these inmates and the frequency of senile dementia in institutions. In *senile dementia* there is a gradual dulling of the intellect involving every faculty, the will and emotions. There are no marked delusions but a gradual weakening of the perception and conception of things and ideas until there is a complete mental blank.

The aged adhere to old habits and ways and find it difficult to adapt themselves to modern ideas. They resent the efforts of friends and relatives who try to induce them to adopt modern ideas and their resentment may develop into hatred so intense and persistent as to become a mania. This unreasonable hatred of those toward whom there should exist the natural affection arising from close relationship may be unsuspected during the life of the aged individual and may not be known until it is found that the person who had incurred this hatred had been left out of a will. The term *oikomania* has been applied to this mental condition.

Changes in Type.—The process of aging

produces a remarkable phenomenon in the approximation of the sexes toward a neuter type. The male pelvis in old age approaches the female type and the female chest resembles the male chest. There is frequently a growth of hair on the face of the female while the hair on the face of the male becomes scanty. The atrophy of the lower maxilla gives to both a weak and weakened appearance. Her voice becomes lower in pitch, his becomes higher. The female acquires some male characteristics and the male becomes effeminate, but the general trend is toward a neuter type. This interesting phenomenon, called virilence in the female, has received little attention.

Care of the Aged.—The general care of the aged in the home and in institutions has received but little scientific study. In recent years the diseases of the aged have received some attention and are studied as a special branch of medicine to which the term *Geriatrics* has been given. Even the slight research work that has been done in this direction has already brought to light some unsuspected causes for early and rapid degenerations but the great problem of old age, the basic cause or causes, is still unsolved.

Duration of Life.—Various formulæ have been devised for estimating the normal duration of life. Nascher's estimate of 90 years is based upon the normal length of each of the three periods, development, maturity and decline. If these periods are not hastened or shortened each lasts about 30 years and each is broken about the middle by a violent change called a climacteric. A senile climacteric occurs about the 75th year during which there is a readjustment of functions, and this is followed by senility, the final stage of life. Cases of extreme longevity are very rare. They are really freaks of nature corresponding to giants in growth.

Bibliography.—Of the voluminous literature dealing with old age, beginning with Cicero's *'De Senectute'* (B.C. 45), a few works have literary interest but only those of recent years have scientific value. The works of the Middle Ages were either philosophical treatises, or works dealing with the prolongation of life based upon the assumption of the existence of the alchemist's panacea. The best known of this period is Roger Bacon's *'De Retardandis Senectutis Accidentibus'* (1290?), translated and published under the title *'The Cure of Old Age'* by Robert Brown (London 1683). Of the earlier works of modern times, C. W. Hufeland's *'Makrobiotik'* (Jena 1796), is best known. This work passed through many editions, was translated into several languages and is still occasionally quoted. The more recent works of this nature are E. Metchnikoff's *'The Nature of Man'* (London and New York 1903), and *'Prolongation of Life'* (ib. 1910); A. Lorand's *'Old Age Deferred'* (Philadelphia 1910); H. Weber's *'Means for the Prolongation of Life'* (4th ed., London 1914). Jean Finot's *'Philosophie de la Longévité'* (Paris 1900) is an optimistic philosophical study (English translation, New York 1909). M. J. P. Flourons' *'De la Longévité et de la Quantité de Vie sur le Globe'* (Paris 1854) is a scientific study based upon statistical research and is frequently quoted. C. S. Minot's *'Problems of Age Growth and Death'* (London

and New York 1908), and C. M. Child's *'Senescence and Rejuvenescence'* (Chicago 1915), are profound biological studies. The first scientific medical work dealing with old age is Sir John Floyer's *'Medicina Gerocomica'* (London 1724). All modern medical works on the subject are based upon E. Canstatt's *'Krankheiten des höheren Alters und ihre Heilung'* (Erlangen 1839). The most recent works are J. Schwalbe's *'Lehrbuch der Greisenkrankheiten'* (Stuttgart 1909); Boy Tossier's *'Maladies des Vieillards'* (Paris 1912); R. Saundby's *'Old Age, Its Care and Treatment'* (London 1913); I. L. Nascher's *'Geriatrics: Diseases of Old Age and their Treatment'* (2d ed., Philadelphia 1916), and Nascher, I. L., *'Care of the Aged'* (Boston 1919).

I. L. NASCHER, M.D.,
Author 'Geriatrics: Diseases of Old Age and their Treatment.'

OLD-AGE INSURANCE AND PENSIONS.—The problems of old-age destitution and legislative efforts to meet it are significant of the modern industrial era in which a very large proportion of the productive population are dependent for their living upon a weekly wage or monthly salary. In an agricultural community the aged remain part of large family units and develop no economic problems of their own. Modern industrial development through the competitive striving for efficiency has shortened the productive period of human existence at the same time when improvements in medicine, hygiene and sanitation have extended the span of human existence. As a result every industrial community sooner or later finds itself confronted with the industrial problem of superannuation and the social problem of old-age dependency, and efforts to provide for these conditions in some scientific way claim the attention of modern government to a rapidly increasing degree. In every country where the problem was carefully investigated, or systematic provision was made, a very large proportion of the aged persons was found to be without any income or earnings. In Great Britain, e.g., out of 1,250,000 persons over 70 years of age in 1908, 414,000 were in poorhouses and other institutions, and 667,000 were found to have practically no sources of income. In France over half a million of persons over 70 years of age, in 1907, were found to possess an income of less than \$6 a month. Though the percentage were less striking in Australian colonies, there too, notwithstanding the generally better economic conditions, a very large proportion of the aged were found in need of support.

Through the same channels which were built to meet the problem of sickness (see *HEALTH INSURANCE*), workmen's organizations, friendly societies, mutual aid societies, etc., made efforts to relieve the conditions of their aged members. But this proved to be a very difficult undertaking and many societies came to grief through inability to meet the obligations assumed, so that in many countries it became necessary to pass laws prohibiting the payment of old-age pensions to friendly societies. On the other hand, large establishments, finding that superannuated employees interfered with the efficiency of the plants, were forced to make

provision for the retirement of their employees, at certain ages. Finally the States sooner or later were obliged to face the problem of some systematic provision for their aged citizens. The discussion of plans for systematic treatment of the problem of old age antedate in many States all other forms of social insurance.

The advantages of the insurance method suggested themselves because the "hazard" of old age dependency could strike only a comparative minority of those who survived at 65 or 70, and besides the possibilities of the law of compound interest working themselves out throughout a long period of years offered very alluring prospects. As early as the fifties, State institutions for voluntary insurance of old-age annuities were organized in France and Belgium and in 1864 even in Great Britain. Developments within the field of old-age insurance were really more typical and characteristic of the theoretical evolution of social insurance than in any other branch. The organization of State insurance funds for furnishing voluntary insurance at cost, the granting of more or less substantial State subsidies to stimulate such gratuitous old-age pensions, followed each other in fairly rapid succession. Organically tied up with old age was the problem of chronic invalidity, which may be considered, both economically and physiologically, as equivalent to premature old age.

Including the systems of gratuitous State pensions, the following classification of legalized methods of old-age provision may be made.

I. Voluntary State insurance without subsidies. Great Britain, 1864; Canada, 1908.

II. Voluntary State insurance with subsidies; France, 1850; Belgium, 1851; Italy, 1898; Spain, 1908; Serbia, 1910.

III. Compulsory old-age insurance. Germany, 1889; Austria (salaried employees only) 1906; France, 1910; Luxemburg, 1911; Rumania, 1912; Sweden, 1912; Netherlands, 1913. Also a large number of special industries in other countries; as e.g., Austria (mining, 1884); France (mining, 1894; seamen, 1898; railroads, 1909); Italy (railroads, 1885); Russia (railroads, 1888), etc.

IV. Old-age pensions. Denmark, 1891; New Zealand, 1898; New South Wales, 1900; Victoria, 1901; France, 1907; Australia (act covering entire commonwealth) 1908; Great Britain, 1908.

From the point of view of efficiency the first method proved a dire failure; the simple provision for safe and cheap old-age annuities failed to attract any considerable proportion of the wageworkers. Even the fairly liberal subsidies, given in several Latin countries, though somewhat more successful, were very far from becoming universal, in fact attracted the lower middle class and the better paid mechanic rather than the great mass of unskilled labor. After some 10-15 years of experience in Italy only a few hundred thousand workmen insured and the average amount of insurance was very small indeed.

The German system of compulsory insurance for old age and invalidity was very much more successful numerically, even though its benefits are rather small. For over 20 years it remained practically the only national compulsory old-age insurance system, but within the last five years before the war a very rapid extension of the same principle in several countries took place. In these new acts, the established methods of the German system were rather closely followed.

These consist in the compulsory insurance of all wageworkers in industry, transportation, commerce, agriculture and domestic service, and salaried persons receiving less than 2,000 marks per annum. The dues are collected in small weekly payments and for this purpose the insured are divided into five income classes with a definite weekly contribution for each. The employers and employees contribute equal shares of weekly premium, which is collected from the employer by means of special stamps, which are pasted in the books of the insured. The final old-age pension begins at the age of 70 and depends upon the wage class of the insured. To every pension a subsidy of 50 marks is added out of the State treasury.

Though the system is known as old-age insurance, the provisions for invalidity are really

WAGE CLASS	Annual wage in marks	Annual wage in dollars	Weekly contribution				Old-age pension at age of 70					
			Old law		New law		Insurance pension		State subsidy		Total	
			Pf	Cents	Pf	Cents	Marks	Dollars	Marks	Dollars	Marks	Dollars
1.....	350	83.80 & under	14	3.3	16	3.8	60	14.28	50	11.90	110	26.18

more important, as over 75 per cent of the pensioners receive their pensions before reaching the age of 70. This is due to the liberal interpretation of the term "invalidity" under the German act, which is not limited to total loss of earning capacity but covers reduction of the normal earning capacity to one-third. The basic invalidity pension is smaller than the old-age pension but the actual amount depends upon the number of paid-up weekly contributions. In the preceding table the main facts in regard to the old-age pensions and contributions are presented. The contributions are given under the old law as well as under the revision of 1911, the latter, however, being larger because some widows' and orphans' benefits have been grafted upon the old age and invalidity system.

In addition there are very complex regulations concerning return of payments in case of remarriage, in case of death and so forth. The later old-age insurance acts on the whole follow the German type of legislation, although there are numerous variations of detail.

Objection has often been raised to this system because of its apparent complexity, and the much simpler method of gratuitous provisions has been advanced as an alternative. This method was first applied on a national scale in Denmark (1891), spread to a few Australasian colonies, and in 1907-08 by national legislation to France, Great Britain and Australia.

The financial arrangements of these pensions laws are very simple. They establish a system of periodic (weekly or monthly) payments to all persons over a certain age (60 in Denmark; 65 in New Zealand and Australia; 70 in Great Britain and France) provided the need is established on the basis of maximum limits both of property and income; there are additional requirements as to citizenship, residence and evidence of worth or good moral character, in general. The French and Australian system also include pensions for permanent invalidity. The actual amount of pension varies according to the circumstances of the individual case, but in most acts there is a definite scale, based upon income from other sources. The Danish pensions vary from 50 kroner (\$16.30) to 200 kroner (\$53.60) per annum, the French from 5 to 20 francs per month (\$0.96 to \$3.86), in Great Britain from one to seven and one-half shillings per week (\$0.24 to \$1.83) and in Australia up to \$2.50 per week.

In addition to the greater simplicity it is argued that this method of straight pensions puts the cost where it belongs, upon the national treasury, and can be collected by a proper tax system. It is also pointed out that the introduction of an old-age pension system immediately meets the existing problem of old-age destitution, while the system of old-age insurance to be effective and reasonably cheap needs a long series of years to work itself out, to allow for the effect of mortality and compound interest.

As against this pension method, it is argued that it remains essentially a method of public outdoor relief, that it has a demoralizing effect directly discouraging thrift (since the pensions are only given on evidence of need) and moreover that it establishes a low dead level of pensions. Pensions gratuitously given

to everybody must necessarily be low, while the method of compulsory insurance permits of a more satisfactory provision based upon the customary wages of the insured. The problem of comparative advantages of these two methods constituted one of the most discussed problems before the international congresses on social insurance.

The inability of solving the immediate problem of old-age destitution through the compulsory insurance system is generally recognized by the inclusion in most old-age insurance acts of complicated so-called transitory provisions, which offer a very much larger State subsidy to the pensions of persons who have reached a certain age at the time the Insurance Law goes into effect. It is evident that for those who are at the time near the pension age, the straight pension element so much predominates over the insurance element, that it might be said that a compulsory old-age insurance scheme has to be ushered in by an old-age pension scheme. Another obvious limitation upon the compulsory old-age insurance method is that it is adaptable only to waged workers or employees while a certain proportion of old-age destitution arises out of other social classes. There is no logical objection to both systems existing side by side, as is proven by the passage of a compulsory old-age insurance law in France in 1910, three years after the pension law was established.

In nearly all civilized countries there is in operation a system of straight pensions to government employees, whose number is increasing in proportion to the rapid development of governmental activities and the industrial activities of the modern state. Many pension systems exist not only for the military establishments but also for the civil employees and finally for the industrial employees of governments. The following countries possess pension systems: Denmark since 1891, New Zealand since 1898, Belgium since 1900, France since 1907, Australia since 1908 and Great Britain since 1908. The straight old-age pension plan has become popular in the United States primarily because of our familiarity with the British plan, while for a generation Germany was the only example of a national compulsory old-age system. France has combined both the compulsory and straight plans. In a sense also the British system may be considered as embracing both plans since a system of compulsory invalidity insurance has been introduced in connection with sickness insurance.

Denmark.—Denmark established the first system of straight old-age pensions by the Act of 9 April 1891. Little attention was attracted to the system for many years until the British plan brought all systems before the public. The Danish plan was intended to be a system of outdoor relief to free the recipient of this form of relief from the various disqualifications, both legal and moral, which poor-relief carries. By this legislation it was admitted that an honest workman, disabled in his declining years, was entitled to support without being classed as a pauper, without losing his rights as a citizen and without losing caste, of which the poor-relief always deprived him. The age of 60 was fixed as the pension age. About 78,000 persons are now in receipt of pensions which aggregate nearly 10,000,000 kroner annu-

ally. Fixed amounts are not stipulated in the law and it has been left to the local distributors to settle, based on their personal knowledge, how much should be given in each case to the parties in question, without too much injustice occurring. The average amount in 1918 was \$33.

France.—The law of 14 July 1905 made it obligatory in France for the state to provide assistance, from 1 Jan. 1907, for aged persons, the infirm and incurable. The scheme is non-contributory and is confined to the necessitous poor. Those admitted to the scheme must be Frenchmen who are without sufficient means and who are incapable of providing by their labor for the necessities of their own existence. They must also satisfy one of the following two conditions: they must be either (a) over 70 years of age, or (b) younger but suffering from an infirmity or a malady which is considered incurable. If they satisfy these conditions, they become entitled to a pension of not less than 60 francs (\$12) a year and not more, except under exceptional circumstances, than 240 francs (\$48) a year. The assistance may be granted either in money or in the form of suitable accommodation and treatment in a hospital or similar institution.

Germany.—The German system is of special interest both because of its avowed intention to stimulate and endow thrift and also of the fact that the contributions imposed are compulsory. The first law on this subject was passed in 1889 and applied compulsorily to all persons over 16 years of age, working for wages or salaries up to \$500 a year, except government and other public officials who were otherwise provided for. In order to draw an old-age pension, the claimant must have attained the age of 70 and must have been insured for a period of 1,410 weeks, termed the "time of waiting." The insured persons are divided into four wage classes and the contributions as well as the pensions differed according to these classes. The employers are responsible for the whole contributory part, but could subtract the contribution of the employees at next pay-day. The premiums were levied in the form of stamps which were issued for the several wage classes. Receipt cards were obligatory and had places for 52 or more stamps and had to be exchanged for new ones when filled up. Some modifications were introduced in the Act of 1899, by which the burden of the payment of premiums was equalized. Later a fifth wage class was added and a central pension office established.

New Zealand.—The act providing old-age pensions was passed in 1898. It provided for the payment out of the Consolidated Fund of a pension of \$90 per annum, or \$1.72 per week, without contribution by the beneficiaries. An amending act of 1 Sept. 1905 increased the full pension to \$130 per annum, or \$2.50 per week. The act applies to all residents of the colony who fulfil the necessary conditions. The qualifications of an applicant are briefly as follows: He must have reached the age of 65; he must have resided continuously in the colony for 25 years; he must not during the past 12 years have been imprisoned for four months; he must not at any time have deserted his wife and children; he must have lived a sober and reputable life for at least five years previous;

his income must not reach \$300, etc. Payment is made by 12 monthly instalments through the post office.

Australia.—The old-age pension system came into force in New South Wales and Victoria in 1901, and closely followed the New Zealand system, and in Queensland in 1908. These plans were superseded by the Commonwealth Act of 1 July 1909, by which the pension age is 60 years for women and 65 for men. A residence of 20 years is required. Pension commissioners fix the pension rate for each special case. It must not exceed \$130; nor must the recipient's total income from all sources exceed \$260. Good character and citizenship are other necessary conditions.

Austria.—In 1906 Austria established compulsory old-age and invalidity insurance after the model of Germany. Only salaried employees are benefited by the act. There are six salary classes.

Belgium.—Minor schemes of insurance had received government aid long before a comprehensive system was enacted into law on 10 May 1900. The two main objects of this law are as follows: (1) Assisted Insurance.—To encourage the working classes to save and to assist them by state contributions, by constituting a fund which will secure to them at the age of 65 an annuity not exceeding 360 francs, or about 18 cents per day. (2) Non-contributory Pensions.—To grant workmen or women, or ex-workingmen or women, special grants of 65 francs per annum when they are in want.

United States.—The old-age pension method is familiar to the American people through the system of war pensions, which are paid to a large number of war veterans at a cost of over \$150,000,000 a year. The British Old-Age Pension Act of 1908 has also stimulated the demand for old-age pensions rather than insurance. While no legislative action, except by some States and municipalities for their own employees, has yet been accomplished, the subject has called within recent years for considerable discussion. Several States have had investigating commissions and the reports of two Massachusetts commissions are perhaps best known. While both of these have been adverse to any immediate legislative program, the subject continues to receive considerable attention. A recent report of the Wisconsin Industrial commission suggests both methods as possible alternatives. Bills for old-age pensions have been introduced in the United States Congress, in Massachusetts and other States.

W., 'Old Age Dependency in the United States' (New York 1912); 'Massachusetts, Commission on old age pensions, annuities and insurance' (1910); 'Massachusetts Report of the Commission on Pensions' (1913); Wisconsin Industrial Commission, 'Report on Old Age Relief' (1915).

OLD BAILEY, London, England, an ancient historic criminal court, prior to 1903 adjoining Newgate Prison, between Holborn Viaduct and Ludgate Hill, where now stands the Central Criminal Court. A prison was attached to it. In the Old Bailey the surviving

judges of Charles I were tried after the Restoration, in 1660, and it witnessed also the trials of the patriot, Lord William Russell, in 1683, Jack Sheppard in 1724, Jonathan Wild in 1725, the poet Savage in 1727, Dr. Dodd in 1777, Bellingham, the assassin of the statesman Perceval, in 1812 and the Cato Street conspirators in 1820. In the days when the criminal law of England was much more severe and far-reaching than it is to-day, Old Bailey Court became known not only in England but all over the English-speaking world for its severity and the number of convictions made and death sentences imposed. In the trial of Charles Darnay for treason, in the 'Tale of Two Cities' Dickens has graphically described Old Bailey. It is now officially designated as the "Central Criminal Court," but non-official England still knows it as "Old Bailey."

OLD BAY STATE, a name given to Massachusetts, whose shores are washed by Cape Cod Bay. Prior to the adoption of the United States Constitution, Massachusetts was known as "the Colony of Massachusetts Bay."

OLD CASTILE. See **NEW CASTILE**.

OLD CATHOLICS, religious denominations formed by certain seceding Roman Catholics in 1870, whose basis of belief and practice was declared to be the revival of the traditions of the Apostolic Church and the recognition, as authoritative, of the first seven œcumenical councils of the Church and none others.

The Cause of the Revolt.—An œcumenical council, commonly known as the Vatican, was convened at Rome and assembled 8 Dec. 1869, which included 49 cardinals, 9 patriarchs of the Eastern Church, 4 primates, 121 archbishops, 479 bishops and 52 abbots and other monastic dignitaries. On 15 Jan. 1870 the number present had increased to 744, and by March to 764. When the object of the council, the definition of papal infallibility, was made known, a protest was made, outside the council, by Dr. Döllinger, the most illustrious scholar of Roman Catholic Germany, supported by the French Minister Darn and the Austrian Von Buesh and a small party of bishops. Nevertheless the dogma was at length promulgated and received the assent of the Roman Catholic hierarchy throughout the world. Its terms were as follows:

"We teach and define . . . that the Roman pontiff, when he speaks *ex cathedra*, that is, when in discharge of his office of Pastor and Doctor of all Christians he defines, in virtue of his supreme apostolic authority, a doctrine of faith or morals to be held by the Universal Church, is endowed with the divine assistance promised to him in Blessed Peter, with that infallibility with which our divine Redeemer willed that the Church should be furnished in defining doctrine of faith or morals, and therefore that such definitions of the Roman pontiff are irreformable of themselves and not in virtue of the consent of the Church." This dogma was promulgated 18 July 1870.

The universities of Germany alone opposed the new Vatican decree. Dr. Von Schulte, professor at Prague, was first to utter a written protest. At Nuremberg a vote of dissent was passed by a meeting of Roman Catholic professors and scholars in August 1870. "Father

Hyacinthe" (M. Charles Loyson) issued his 'Appel aux Evêques Catholiques,' denying that the decree was binding on the Church. The learned Dr. Döllinger set forth in a letter his reason for dissent as "a Christian, a theologian, an historical student, and a citizen." His excommunication was immediately proclaimed from all the pulpits of Munich. He was, however, supported by the professors of the University, and an address to the king, written in the same spirit of protest, received 12,000 Roman Catholic signatures. Finally an assembly of the dissentients was held at Munich the following September and was attended by 500 delegates from all quarters of Europe. The lectures of Reinkens delivered in 1871 made the issues plain to the world, and his arguments were echoed and enforced in the inaugural address delivered by Dr. Döllinger as rector of the University of Munich.

Constitution of the Old Catholic Church.

—The movement gradually gained such momentum that organized action was forced upon its supporters. On 4 June 1873 Dr. Reinkens was consecrated their bishop at Rotterdam by the Jansenist Bishop Heydekamp of Deventer and, as the cause was spreading rapidly in Switzerland, a congress was held there and was attended by both English and American theologians (12-14 September). The election of Bishop Reinkens was recognized by the German government, and in the following year a synod and conference were held at Bonn. The results of these discussions were embodied in canons by which the clergy were allowed to marry, compulsory fasting and confessions were abolished, the vernacular was ordered to be used in public worship, and it was made permissible in the churches to administer the communion in both kinds to Anglicans. In Switzerland the Old Catholics, or as they there preferred to style themselves, Christian Catholics, chose Professor Herzog for their bishop and he was duly consecrated by Bishop Reinkens 18 Sept. 1876. The University of Bern elected an Old Catholic faculty and in 1890 there were 55 congregations under Bishop Herzog, with some 50,000 lay members and 72 ministering clergymen. In Austria the Old Catholics organized themselves in 1888 and in 1900 were reported to number 16,000 souls. In France a Gallican Old Catholic movement was set on foot by Père Hyacinthe under the jurisdiction of the Arminian archbishop of Utrecht. The Old Catholics in Italy were led by Count Campello, those in Spain by Cabrera and in 1890 and 1892 there was an international Congress of Old Catholics at Lucerne, another at Rotterdam in 1894 and a third at Vienna in 1897. On the death of Bishop Reinkens in 1896, Vicar-General Theodor Weber was elected to take his place and consecrated in Bonn with a jurisdiction extending over the German Empire. In this large diocese the Old Catholics number 61 priests (four of them retired and two holding professorates), and from 45,000 to 50,000 lay members; and were building many churches, parsonages and seminaries. At Bonn and Essen they have founded hospitals and poorhouses. Among the periodicals devoted to the interests of the Old Catholics' movement are *Internationale Theologische Zeitschrift* (Bern); *Der Katholik* (Bern); *Alt-katholisches Volksblatt* (Bonn); *Deutscher Merkur*

(Bonn); *Amliches Altkatholisches Kirchenblatt* (Bonn); *Le Catholique National* (Bern); *Le Catholique Français* (Paris); *La Luz* (Madrid); *Giro Camo Savonarola* (Piacenza); *Il Labaro* (San Remo); *Dé Oud Katholiek* (Rotterdam); and *Revue Internationale de Theologie*. M. E., 'The story of the old Catholic and Kindred Movements' (London 1883).

OLD CHURCH SLAVONIC LANGUAGE AND LITERATURE, in Slavic philology, the name of the parent tongue of Slavonic group languages and literature. In the 9th century the Slavic biblical and liturgical books were translated by the "Slavonic apostles" Cyril and Methodius, into a dialect which probably was spoken in Macedonia and the vicinity of Salonika, where these scholars were born and lived in their boyhood. The Slavs, like all primitive peoples, practised divination at first by means of marks and cuts on wood. Later the Southern Slavs used an alphabet called Glagolitic (*Glagolitsa*), which has survived as a liturgical script in certain parts of northern Dalmatia. After their baptism the Slavs were compelled to write the Slavonic tongue with Greek and Latin letters, without any proper rules. Constantine the Philosopher, named Cyril in monastic life, was the first teacher who made them an alphabet of 38 letters (hence the name Cyrillic, in Slavic *Kyrilitsa*). The question into which Slavic dialect were translated church books is still unsettled. The Bulgarian and some German philologists believe that this dialect was the old Bulgarian language. The noted Serbian scholars Daničić and Novaković, and the Russian historian, Kačanovsky, assert that this was old Serbian, while Kopitar, Miklosich and Jagić maintained that old Slavic was identical with old Slovene, as it was spoken in the province of Pannonia, in the 9th century. But there is no doubt that in such decisions much was due to local patriotism or political sentiments. As the liturgical literary organ of the church, Old Church Slavic completely outgrew its original domain. It spread gradually from province to province wherever the divine service was carried on in the Slavic tongue. It penetrated to all the South-Slav lands, and was to be found among Serbo-Croats, Bulgars and the Eastern Slavs (Russians). In all these regions the church language officiated according to mediæval conceptions, both as the national and the common speech, just as the Latin type did among the Roman and Teutonic peoples. In exercising its "civil" functions it laid itself open to the different local influences, as to intonation, form and a continually enlarging vocabulary. Since the 11th century one can accurately speak of the Serbian, the Russian and the Bulgarian recensions, or rather of Serbo-Slavonic, Russo-Slavonic and Bulgaro-Slavonic. It is remarkable to notice that the Church Slavic of the Middle Ages even took into its scope for a considerable time, tongues

which were not Slavic. This happened, to Rumanian in the south, and to Lithuanian in the north.

The sway of Church Slavic as the mediæval literary speech of all the Orthodox Slavs lasted many centuries. In Russia it obtained until the time of Peter the Great, and among the Serbs and Bulgars until the end of the 18th century. Peter the Great put the first obstacle in the way of the monopoly of Church Slavic as the Russian literary speech. He ordained a new form, a kind of modernized letter adopted under Dutch influence, and called this the citizens' alphabet. The hitherto superfluously ornamented letters and characters of the abbreviated words and expressions were kept in reserve for church use. Thus the Old Slavic was limited only to liturgical purposes. Even theology as doctrine and church oratory and administration were henceforth carried on in the new Russian language, which was used in the church service only on special occasions.

Among the Orthodox Southern Slavs, particularly the Serbians, a mixture of Church Slavic in Russian form with a popular rendering was in vogue to the end of the 18th century. Vuk Stefanović was the first reformer to shake off the remnants of this artificial dialect. The pure speech of the Serbian people came into its own as the common organ of officialdom and literature. The influence of Vuk Stefanović in Bulgaria arrived somewhat later and more tardily. So even till to-day all Orthodox Slavs have one and the same church language, which is essentially restricted to church uses. The limits to which it is employed are much narrower than those allowed to the Latin in the Catholic Church. As to the ancient literature in Old Church Slavic, it was mostly written by clergymen of all ranks, and very often by the monarchs themselves, who either chose to, or were forced to, renounce the throne and to join monastic life. They generally wrote their books and documents in the cloisters: at Hilendar (Mount Athos), at Studenica, Dečani, Rilo, Pečerskiy and many another monastery in the Balkan Peninsula and southern Russia. The writers imitated Greek literature, which was very handy to them and extremely rich in content. Properly speaking the Old Slavic literature represents Byzantine literature *en miniature*. It embraces almost the same branches of literary production: theology, history, rhetoric, mysticism, asceticism, polemics, exegesis and other religious topics existing in almost any country at that time. There have been collected up to now 5,000 manuscripts, which represent the production of the old period of Slavic literature, but it cannot be affirmed that there are so many finished works. Besides compilations and translations there are original writings and documents mostly on the lives of the Slav and Yugoslav saints. The disciple of Cyril and Methodius, Clement (styled in the titles of his works, "the Slavonic apostle") wrote many sermons and panegyrics of saints. To him and his pupil Gorazd, is assigned 'Vita SS. Cyrilli et Methodii,' a valuable biography of the Slavic missionaries. Of the year 1073 is the 'Izbornik' or 'Miscellany' of Prince Sviatoslav, written for that prince by John the diak or deacon. This is a kind of a Russo-Slavonic encyclopedia, drawn mostly from

Greek sources. Its style is praised as clear and simple. The reputed author of the earliest Russian Chronicle, Nestor (1056-1114), a monk of the Pečerskiy cloister of Kiev, wrote his books in Herodotean manner, and gave important ethnological data of Slavonic races. Similar works are found in Serbo-Slavonic recension under the name 'The Ancient Serbian Biographies.' The best writers of the time were Archbishop Sava or Saint Sava (1164-1236), his brother, King Stefan Prvovenčani (i.e., the 'first crowned'), and the monks Domentian, Theodosius and Gregorius Tsamblak. The highest literary creation of the period is undoubtedly 'The Lives of the Serbian Kings and Archbishops,' by Archbishop Danilo (d. 1338). With the Serbian 'Enlightener' (*Prosvetitelj*) Sava and the Russian historian, Nestor, began the long series of Slavic annalists, whose works remind us of the 'Anglo-Saxon Chronicle,' with dry details and quaint stories. The chronicles and biographies in the Old Slavic literature are almost without literary value, but as historical material they are useful. In the field of legislation there are some codes of laws in early Slavonic literature which represent many features of interest. Such are the 'Russkaya Pravda' of Yaroslav (11th century) and the 'Zakonik Stefana Dušana' (14th century). Both of these codes show that the Slavs were at that time quite on a level in civilization with the rest of Europe. From the 15th to the end of the 18th century, the cultural life of the Southern Slavs and their literature was almost entirely centred at Ragusa (Dubrovnik), the only portion of the Yugoslav country which was free from the Ottoman yoke. But because this literature was no longer written in the Old Church Slavonic, it remains beyond the scope of this article.

panih knjiga' (Belgrade 1901); Schleicher, 'Die Formenlehre der Kirchenslavischen Sprache' (Bonn 1852); Sobolevskiy, 'Drevniy tserknovno-slav. yazik' (Moskva 1891); Šafarik, 'Památky dřevního písemnictví Jihoslovánu' (Prague 1851); id., 'Slovanské Starožitnosti' (Prague 1862-63); Vondrak, 'Altkirchenslavische Grammatik' (Berlin 1900).

MILIVOY S. STANOYEVICH.

OLD COLONY, a name applied to the southeast part of Massachusetts, the section occupied by the Plymouth Colony, and later given to the State.

OLD CREOLE DAYS, a collection of short stories published in 1879 by George W. Cable, then a young man living in New Orleans. The setting of the stories is that of the picturesque old French and Spanish city in the early years of the 19th century just as it was merging into the American city of later years. Against the background of the Rue Royale with its balconies, cafés and gardens, or the historic mansions on the bayous and the Mississippi, charming types of Creole men and women, with now and then picturesque backwoodsmen or more practical Americans, are portrayed in these stories, that may challenge comparison with the best short stories of modern literature. Mr. Cable is as supreme a master of style as he is of delicate characterization and romantic incidents. One cannot praise too highly the atmosphere of charm and distinction that he has thrown about one of the outstanding human situations in American history. While the author now and then reveals a tendency, so marked in his later writings, to suggest his own interpretation of social problems engendered by certain caste feelings, these stories have the freshness and the charm of a master artist. While it is difficult to speak too highly of the 'Café des Exilés,' 'Tite Poulette,' or 'Madame Délicieuse,' there is something more elemental in 'Posson Jone' and 'Jean-Ah Poquelin.' The last-named story, in its revelation of the hero's resistance to the American invasion and of a brotherly love that knows no limit in its self-sacrifice, is one of the moving tragic stories of modern times.

EDWIN MIMS.

OLD CURIOSITY SHOP, a novel by Charles Dickens, written in 1840-41, as a serial for *Master Humphrey's Clock*, a weekly periodical based on the model of Addison's *Spectator*, to publish short stories, essays and miscellaneous papers. In the fourth number, according to the public request for another 'long story,' Dickens commenced the 'Old Curiosity Shop.' It is a novel of a difficult trend with an involved plot. The character of Little Nell stands out as that of a precocious child of inherited tendencies in a somewhat overdrawn exhibition of pious seriousness and long submissive suffering, which plays upon the sympathy and emotions of sentimental readers. Jeffrey and Landor, however, compared the delineation of this character to that of Cordelia. The story is relieved by the lively wit of Dick Swiveler, the Marchioness, Quilp and the description of the wandering Bohemians which maintain the best characteristics of the humor Dickens had originated in the 'Pickwick Papers'; 'Nicholas Nickleby,' etc.

OLD DOMINION, a name given to Virginia. In the original charters pertaining to the lands of Virginia, it was frequently called "the colony and dominion of Virginia." Massachusetts was given the name "Old Colony" and Virginia "Old Dominion."

OLD-FIELD LARK, a local name in the Southern States for the meadow-lark (q.v.).

OLD FOLKS AT HOME, a famous Southern plantation song, words and music written in 1850 by Stephen Collins Foster (q.v.). The song realized some \$15,000 for the author.

OLD FORGE, Pa., borough in Lackawanna County, on the Lackawanna River, and on the Lehigh Valley, and the Delaware, Lackawanna and Western railways, about five miles southwest of Scranton. It was settled in 1830 and remained a part of the Old Forge township until 1899, when it was incorporated as a borough. It is in the anthracite coal region and a large number of the men and boys of the borough are engaged in coal-mining. The chief industries beside the mining and shipping of coal are glass-blowing, manufacturing silk goods, and making chemicals and fertilizers. It has a fine high school building and good grade schools. The government is administered by a burgess, who holds office three years, a borough council and subordinate officials. Pop. (1920) 12,237.

OLD GLORY, a popular name for the flag of the United States. It was first applied in 1831 by William Driver, a sailing captain of Salem, Mass., who died at Nashville, Tenn., in 1886. Previous to the outbreak of hostilities between the North and South "Old Glory" was flung to the breeze every day from the window of Captain Driver's Nashville house; but when the conflict began the old flag had to be secreted. It was kept out of sight till General Nelson's wing of the Union army appeared in Nashville 27 Feb. 1862, when Captain Driver presented it to the general to be hoisted on the Capitol. It was run up, and Captain Driver himself did the hoisting. Its name and history soon became familiar to all the soldiers in General Nelson's command.

OLD GRIMES, the hero of a popular humorous American ballad and song, by Albert Gorton Greene (q.v.). The title is an adaptation from one of the metrical tales by George Crabbe, but the personage described in the ballad is an exaggerated study of an eccentric New Englander who flourished in the earlier half of the 19th century.

OLD GUARD, The, a popular name applied to a body of French troops in the army of Napoleon I. The Guard consisted of five regiments; was distinguished for bravery, and at the battle of Waterloo made the final charge of the French army. Previously it had suffered severely in the Russian campaign. The Guard was created by Napoleon in 1804, out of picked men from every part of the service and from members of the Consular Guard. The Old Guard was peculiar in that it had its own general staff and received orders from its own commander-in-chief alone.

OLD HICKORY, an affectionate nickname given to Andrew Jackson (q.v.) by his militia troops, on account of his toughness and

endurance of hardship. It seems to have been first conferred on occasion of his march back from Natchez in February 1813, when, after having sent him there to foil an expected British attempt on New Orleans, Secretary Armstrong ordered him to disband his men. Jackson in great wrath marched them home in a body, undergoing great discomforts on the way.

OLD HUNDRED, a popular religious hymn tune adopted from a 15th century melody. The tune is found in the Flemish Psalter (1540) and in the Dutch Psalter (1561). In England it was originally sung to the 100th Psalm. The melody was adapted to Beza's CXXXIV Psalm, included in the Geneva Psalter (1554), and was arranged by the musical editor of the book, Louis Bourgeois. Hence the tune has been frequently credited to him. It was included in the Psalms with music by Marot and Beza (Lyons 1563); and two years later, in Claude Goudimels' collection of tunes published in Paris. It is thus evident that it was both well known and popular by the middle of the 16th century. In England it was originally known as the "hundredth tune"; and from this designation came the name "Old Hundred." Consult Fitzgerald, 'Stories of Famous Songs' (1897).

OLD IRONSIDES, a name applied to the United States frigate *Constitution* (q.v.).

OLD KENTUCKY HOME, a famous plantation song, written and set to music by Stephen Collins Foster in 1850.

OLD LINE STATE, a popular name for the State of Maryland, which in the early colonial days was the dividing line between the Crown land grants of William Penn and Lord Baltimore.

OLD MAN; OLD WOMAN, ornamental and culinary herbs. See ARTEMISIA.

OLD MAN OF THE MOUNTAIN, a name given to a huge rock on Profile Mountain, in the Franconia Range, N. H. When viewed from certain positions it bears a marked resemblance to a man's face. The name is sometimes given to Profile Mountain.

OLD MAN OF THE MOUNTAIN, the mediæval name of the ruler of the Assassins. See MOHAMMEDANISM.

OLD MAN OF THE SEA, (1) frequently in Greek poetry, an epithet applied to Nereus. (2) In the 'Odyssey,' an epithet also of a sea-deity, Phorcys or Phorcus. (3) In the 5th voyage of 'Sinbad the Sailor' in the 'Arabian Nights' Entertainments, an old man, who, under pretense of being carried by Sinbad across a brook, fastened himself upon the latter's back and could not be dislodged. Sinbad finally made him intoxicated, threw him upon the ground and broke his head with a stone. In a derived sense, the expression is often used of a bore, or of a burden that cannot be escaped.

OLD MORTALITY, a novel by Sir Walter Scott published in 1816. It deals with the struggle between the Covenanters and the forces of the Crown under Claverhouse (see GRAHAM, JOHN, VISCOUNT DUNDEE), about 1670. The title is the nickname given to Robert Paterson (q.v.), who bestowed years of care upon the gravestones of Covenanters.

OLD NICK, popular sobriquet of the Devil, derived from Saint Nicholas (Ger. Nicolaus, diminutive Nickel, often used of the Devil) and more remotely from Nekker (or Nikker), a Teutonic water-sprite whose appearance to sailors foreboded death and drowning. Christianity, when it got the upper hand in the Germanic countries, still retained a liking for this old Teutonic culture god; but the priesthood did its best to discredit him. Hence he survives to-day with two exactly opposite characteristics. As Saint Nicholas and Santa Claus he is the beneficent culture god and lover of children as he was beloved and respected by the Pagan people. As Old Nick he lives up to the reputation the Christian priests gave him when they degraded him from his high estate. He was the carrier of souls to the future world, and as such boded disaster. In this respect he is closely related to the Irish Ban She; and from this side of his character his Old Nick attributes were deduced. Old Harry, Old One, Old Scratch are other names similarly used.

OLD NORTH STATE, *The*, a name sometimes given to North Carolina (q.v.).

OLD OAKEN BUCKET, *The*, a poem by Samuel Woodworth (q.v.), an American poet, written in 1817 and first published as 'The Bucket.' The air to which it is set is an adaptation of Frederick Smith's music of Moore's song 'Araby's Daughter.'

OLD ORCHARD, Me., town in York County, on the Atlantic Ocean, and on the Boston and Maine Railroad, about 10 miles southwest of Portland. It is a famous summer resort, on account of its smooth ocean beach 12 miles long, where surf bathing is safe, and there are good opportunities for fishing. Deep-sea fishing is a favorite sport, but those who prefer still-water fishing go to Biddeford Pond nearby. In 1903 conventions were held here under the auspices of the Christian Workers' League, the Christian Alliance, and the Woman's Christian Temperance Union, and a Musical Festival, a White Cross Convention, and a Methodist Convention. The population is several thousand in the summer months, but the regular residents number about 1,700.

OLD POINT COMFORT, Va., a famous watering place in Elizabeth City County; on the point of a small peninsula where Chesapeake Bay and Hampton Roads enter the Atlantic Ocean. It is near Fort Monroe and about five miles north of Norfolk. The climate is equable, the opportunities for bathing, fishing and boating are excellent; the garrison at the Fort, and the cities of Norfolk and Portsmouth nearby all add to the attractions. The place has two excellent hotels which are frequented summer and winter. Commercially the town is active in the shipment of fish, oysters and vegetables.

OLD RED SANDSTONE, *in geology*, a name loosely used by Hugh Miller (q.v.) in his 'The Old Red Sandstone' and 'Footprints of the Creator,' for the formation below the Carboniferous (q.v.), and above the Silurian (q.v.) New Red Sandstone (q.v.) was by contrast used of similar red strata of Permian Age. Miller's books did much to draw the attention of scientists to this group of Paleozoic rocks, and the term became popular. In scientific usage it was soon ousted by 'Devonian' (q.v.),

which as suggesting Devonshire the typical English locality is less misleading than Old Red Sandstone, inasmuch as these rocks consist of other sandstones than red, for example, white, yellow and green, and of many beds of clay and limestone. These beds are believed to be largely of estuarine and terrestrial origin, containing both marine and land fossils. The Devonshire rocks, on the other hand, are not sandstone but chalk; the identity or similarity of geological genesis between the rocks of Devon and Miller's Scotch sandstones was proved by the similarity of fossil remains. In America the main groups falling under the head of the Devonian or Old Red Sandstone System are those styled by the New York Geological Survey, the Catskill, Chemung, Portage, Hamilton, Marcellus, Upper Helderberg, Schoharie and Oriskany groups (qq.v.).

OLD SQUAW, or **OLD WIFE**, the long-tailed duck (*Clangula hiemalis*), a sea-duck present in the nesting season in all boreal regions, and visiting the United States in winter. It is blackish and whitish; head, neck and lower parts mostly white in winter; a patch of gray on the head; breast brownish black; bill black and orange; tail very long—a means of instant recognition of the drake. The tail of the female is short, and her plumage is mostly grayish brown. Gunners sometimes call the drake "old injun" and the female alone "old squaw"; also "south-southerly," etc. Most of the names are taken from its noisy habits, for it is almost continually calling, but its cries are musical. They are favorite with gunners more from the skill required in shooting them, on account of their swift flight and wary ways, than for excellence of flesh; they rarely present themselves for a shot except when they come into the bays and river mouths for food at sunrise, flying in long lines. They also are met with on the Great Lakes.

OLD TESTAMENT, Canon of the. See BIBLE, Vol. III, p. 613.

OLD TESTAMENT, Jewish Translations of the. See BIBLE, Vol. III, p. 652.

OLD TESTAMENT INTERPRETATION, History of. See BIBLE, Vol. III, p. 638.

OLD TESTAMENT STATISTICS. See BIBLE, Vol. III, p. 673.

OLD TESTAMENT TEXT CRITICISM. See BIBLE, Vol. III, pp. 629-633; 669-671.

OLD-WOMAN-WHO-NEVER-DIES, according to a Mandan myth, is a supernatural character who lives in the moon. She is the mother of six children, three sons and three daughters, the Sun, the Night, the Morning Star, the Evening Star, and two other stars, one of which circles round the polar star. Old-Woman-who-never-dies sends the geese and wild fowl in the spring, and she makes the corn grow. Dances are given in her honor in the spring and in the autumn at which she is entertained among other things to send the buffalo. The great stag, the white-tailed stag and the blackbirds help the Old-Woman-who-never-dies to guard the corn fields and the mice and the moles aid the good work. She lives in the south and when the birds go south in the fall they go to her and she feeds them out of her magic kettle which never becomes empty.

OLDBERG, öld'bérg, **Arne**, American musician: b. Youngstown, Ohio, 12 June 1874. He studied at Vienna and Munich under Leschetizky and Rhineberger, and since 1899 he has been professor of music at Northwestern University. He was president of the Chicago Manuscript Society in 1901-03. His compositions in chamber music include several quartets, a trio and three quintets, and among his orchestral compositions are two symphonies, two overtures, a theme and variations, an orchestral rhapsody and an organ concert. He has also composed numerous pianoforte pieces.

OLDCASTLE, öld'kas-l, **Sir John**, **LORD COBHAM**, English nobleman: b. Herefordshire in the 14th century; d. London, 25 Dec. 1417. He obtained his peerage by marrying the granddaughter of Lord Cobham. A zealous adherent of Wickliffe, he collected and transcribed his works and distributed them among the people. In the reign of Henry IV, at the head of an English army in France, he obliged the Duke of Orleans to raise the siege of Paris. Under Henry V he was accused of heresy, and not being able to satisfy his accusers he was condemned as a heretic, and committed to the Tower, but escaped. It was then reported to the king that 20,000 Lollards were to assemble at Saint Giles' for his destruction, with Lord Cobham at their head. This accusation seems to have been credited by Henry, and there certainly was an abortive attempt at a Lollard rising, with which Oldcastle was probably connected. He avoided capture for a time, but at last was taken, and as a convicted heretic and traitor was "hung and burnt" in Saint Giles' Fields. In later days he was represented as "the blessed martyr Lord Cobham," though, on the other hand, he figured as the boon companion of young Prince Henry, a roysterer and a coward. Hence his name was originally adopted by Shakespeare in his 'Henry IV,' instead of that of Falstaff. The old play of Sir John Oldcastle (1600) adopts the favorable view of his character. Consult Gilpin, 'Life of Sir John Oldcastle' (London 1765), and also lives by Gaspey (London 1843), and Brown (London 1848); Maurice, 'English Popular Leaders' (London 1872).

OLDENBURG, öld'dén-bërk, **Henry** (Ger. öld'dén-boorg), German writer and courtier: b. Bremen, Germany, about 1615; d. Greenwich, England, September 1677. He was graduated from the Gymnasium Illustre, Bremen, in 1639; sent as consul for Bremen to London and served in that capacity during the "Long Parliament" and Cromwell's Protectorate. In addition to attending to his diplomatic duties he devoted much time to literature. He was one of the first members of the society organized in 1660, which later became the Royal Society, and he was a friend of Milton, Spinoza, Bayle and many other leaders in the world of learning. He edited the 'Transactions' of the Royal Society (1664-77) and published numerous translations, among which are 'A Genuine Explication of the Book of the Revelation,' by A. B. Piganius (1671) and 'The Life of the Duchess Mazarine.'

OLDENBURG, Germany, (1) a town, capital of the state of the same name, 24 miles northwest of Bremen, on the Hunte, which here receives the Haaren and forms a

harbor. It has fine promenades on the site of the old fortifications, two grand-ducal palaces or residences, one of them containing a fine library, a handsome grand-ducal picture gallery, a modern town-house, a public library, museum of Germanic and other antiquities, fine theatre, railway station, gynasium and commercial school. Among its foremost industries are manufactures of tobacco, glass, leather, soap, earthenware, corks, linoleum, yarn, knit goods, brick and musical instruments. Pop. over 30,000. (2) The grand-duchy of Oldenburg, comprising the duchy of Oldenburg and the principalities of Birkenfeld and Lübeck, has an aggregate area of 2,479 square miles. It borders on the North Sea and is surrounded east, south and west by Hanover. In the Diet or Reichstag of the German Empire the duchy is represented by three deputies and in the Bundesrath or Federal Council by one member. The ducal house of Oldenburg dates from the commencement of the 12th century, and among its branches are the kingly houses of Denmark and Greece. Pop. about 400,000.

OLDFIELD, old'fēld, **Anne**, English actress: b. London, England, 1683; d. there, 23 Oct. 1730. Her dramatic powers attracted the attention of Farquhar, the dramatist, and through his influence she made her appearance at Drury Lane. She soon overcame adverse criticism and rapidly rose to be the leading actress of her day. Her preference was for rôles in plays of the "genteel comedy" order, but when finally persuaded to take tragic parts she is said to have startled even her fellow actors by her power. Though received in the highest social circles her private life furnished ground for censure, as she openly lived with Arthur Mainwaring, and after his death with General Charles Churchill. She was buried in Westminster Abbey with high honors. Her most famous rôles were Lady Betty Modish in 'The Careless Husband'; Jane Shore; Cleopatra; Sophonisba. Consult Baker, 'English Actors from Shakespeare to Macready' (New York 1879); Doran, 'Annals of the Stage' (Bath 1888); Geneste, 'Some Account of the English Stage' (Bath 1882).

OLDHAM, öld'am, **John**, American colonist: b. England, 1600; d. Block Island, R. I., 1636. He came to Plymouth from England in 1623, but because of designs against the Plymouth government entertained by him with John Lyford, a Church of England clergyman, he was banished from the colony. He subsequently made his peace with the colonists and was of service to them on several occasions. Removing to the Massachusetts Bay Colony he settled in Watertown, which he represented in the first General Court. His murder by Indians on Block Island in 1636 was the chief incident leading to the Pequot War (q.v.).

OLDHAM, William Fitzjames, American Methodist Episcopal bishop: b. Bangalore, India, 15 Dec. 1854. He was educated at the Madras Christian College, at Allegheny College, Meadville, Pa., and at the University of Boston. He entered the Methodist Episcopal Ministry in 1883, and in 1884 founded the Malaysian Mission of the Methodist Episcopal Church at Singapore, Straits Settlements and

in the East Indies. In 1885 he founded the Anglo-Chinese School at Singapore, which in 1918 had 1,000 students. In 1895 he founded a chair of missions and comparative religions at the Ohio Wesleyan University and was its occupant in 1895-1900. He was assistant secretary of the Missionary Society of the Methodist Episcopal Church in 1900-04; was missionary bishop for southern Asia in 1904-12; and in 1912 was appointed corresponding secretary of the Board of Foreign Missions. He was Graves lecturer at Syracuse University in 1912 and 20 May 1916 he was elected a bishop.

OLDHAM, England, town in Lancashire, six miles northeast of Manchester. From an insignificant village in the 18th century, Oldham during the 19th century became one of the chief seats of the cotton industry, and an important coal-mining centre. In the town and the immediate neighborhood there are over 300 cotton mills, which employ about 40,000 mill hands. Its numerous other industries include wool-weaving, hat-making, iron-founding and the manufacture of engines, gas-meters, sewing machines and cotton weaving and spinning machinery. Although irregularly built on hilly ground and of no great architectural pretensions, Oldham is distinguished for its municipal enterprise and the administrative ownership of its various public utilities, as gas, water, electric-lighting plant, street railroads, baths, wash-houses, hospitals, cemeteries, markets and museums. Pop. about 150,000.

OLDHAMIA, a genus of carboniferous brachiopods, known as fossils in the rocks of India and China. The name has also been applied in Great Britain to some remains of indeterminate character, probably of sea weeds. It also applied to a fossil alga found in the Cambrian rocks of Ireland.

OLDMIXON, *ôld'mik-sŏn*, **John**, English political writer: b. Axbridge, Somerset, 1673; d. 1742. In his 'Essay on Criticism in Prose' (1728), he attacked Pope, who returned the compliment by abusing Oldmixon in the 'Dunciad.' He published also 'The British Empire in America' (1708); 'A History of England' (1730-39); 'The Secret History of Europe' (1712-15); 'Memoirs of the Press' (1710-42). He was distinguished for his hatred of the Stuart family.

OLDTOWN, Me., city in Penobscot County, on the Penobscot River, and on the Bangor, Aroostook and the Main Central railroads, about 11 miles northeast of Bangor. It was settled in 1820 and was a part of Orono until 1840, when it was incorporated as a town; and was chartered as a city in 1891. It is in a lumber region, and the chief manufactures are wood products, machinery, patent medicines, chemicals and foundry products, pulp, boots and shoes, woolen goods and large quantities of lumber in different forms. It has a free public library in different forms. It has a free and a fine city hall. The revised charter provides for a mayor and council elected annually. Pop. 6,630. Consult Howard, 'History of Penobscot County.'

OLDYS, *ôl'dis*, **William**, English antiquary: b. probably London, 14 July 1696; d. College of Arms, 15 April 1761. He was a natural son of Sir William Oldys, Chancellor of Lincoln.

He suffered financially through the South Sea Bubble in 1720, and in 1724-30 he was the guest of the Earl of Malton. He assisted Dr. Knowler in editing the 'Earl of Strafford's Letters and Despatches' (2 vols., 1739). On his return to London in 1730 he found that his library and manuscripts had been sold, among them an annotated copy of Gerard Langbaine's 'Dramatick Poets,' which later formed the foundation for Cibber's 'Lives of the Poets' (1753). Despite this loss he had succeeded in 1731 in collecting a valuable library which he sold to the Earl of Oxford, and in 1738-41 he was literary secretary to the earl. Upon his patron's death Oldys was forced to subsist upon irregular employment from the booksellers, relieved in 1742-46 by his work with Dr. Johnson in preparing a catalogue of the library of the Earl of Oxford and the 'Harleian Miscellany' (8 vols., 1744-46). In 1747-60 he contributed much valuable material to the 'Biographia Britannica,' but owing to financial difficulties he spent the years 1751-53 in Fleet Street Prison. Through the efforts of friends his debts were then paid and he was appointed Norroy king-of-arms. He lived at the College of Arms the remainder of his life. His works include 'The British Librarian' (1737-38); 'Life of Raleigh,' prefixed to Sir Walter Raleigh's 'History of the World' (1736; separate ed., 1740); 'Life of Charles Cotton' (1760).

OLE BULL. See **BULL**, **OLE BORNEMANN**.

OLEAN, *ô-le-ân'*, N. Y., city in Cattaraugus County, on the Allegheny River at the mouth of Olean Creek and on the Pennsylvania, the Erie, the Pittsburg, Shawmut and Northern railroads; about 68 miles in direct line south by east of Buffalo. It was settled in 1804 by Major Hoopo and David Heuston, was incorporated as a township in 1808, as a village in 1854 and was chartered as a city in 1893. It is in a fertile agricultural region and near the Pennsylvania oil fields and is a distributing point for large quantities of petroleum which is brought by pipe lines from the oil fields south of the city and considerable of it is sent by the same means to other cities. The chief manufacturing establishments are lumber mills, tanneries, oil-refineries, glass factories, machine, railroad and copper shops, wagon and carriage factories, brewery, brick yards, flour mills and furniture factories. The educational institutions include public schools, one parish school, commercial colleges and the Foreman Library. The two banks have a combined capital of \$225,000 and the total assets are over \$4,000,000. The government is vested in a mayor, elected for two years, and 12 aldermen, six of whom are elected each year. Pop. (1920) 20,506.

OLEANDER, a genus of shrubs (*Nerium*) of the order *Apocynaceæ*. The two or three species have narrow, leathery, evergreen leaves and terminal cymes of flowers, usually pink, followed by pods containing twisted seeds. The common oleander (*N. oleander*) is a native of subtropical and tropical Asia and of the Mediterranean region, whence it has been introduced into other warm countries as an ornamental shrub and hedge plant and into greenhouses for growing in tubs. In the Bermudas it is so abundant that the landscape is perceptibly tinted

by its bloom at some seasons. Otherwise the shrub seems to have few uses though charcoal from its soft light wood is used in Algeria for making gunpowder. The plants are easily grown from cuttings placed in water or in wet sand. They thrive best in rather moist soil, but will also do well upon high land if they obtain a good root-hold. The sweet-scented oleander (*N. odorum*), a native of Japan, India and Persia, is less sturdy than the common species and is less cultivated.

OLEASTER, or SILVERBERRY, a shrub (*Elæagnus angustifolia*) of the order *Elæagnaceæ* (q.v.), an ornamental plant introduced from western Asia and southern Europe into temperate climates as an ornamental plant. It grows about 20 feet tall, is often spiny, has narrow light green leaves about two inches long, small, fragrant bell-shaped flowers, followed by yellow, oval silvery-scaly fruits. It seems to prefer well drained limy soils and sunny situations. It is very popular in cold climates, especially in the Dakotas and Minnesota, where it has proved hardy.

OLEFIANT GAS. See ETHYLENE.

OLEIC ACID, $C_{18}H_{34}O_2$, the most important member of the "oleic" series of unsaturated organic acids occurs as the glyceride triolein, $C_3H_5(C_{18}H_{33}O_2)_3$, in most liquid and solid fats as olive, almond and codliver oils, lard, tallow, etc., olive oil being about 72 per cent pure olein. To obtain the free acid the fat is saponified with alkali, the soap so formed dissolved in water and the fat acids liberated by the addition of dilute hydrochloric or sulphuric acids. This impure oleic acid is heated for a time with powdered lead oxide (litharge). The lead salts so obtained are extracted with ether which dissolves only the lead oleate. On acidifying the ethereal solution with dilute hydrochloric acid the lead is precipitated as lead chloride, leaving the pure oleic acid in solution from which it can be obtained by evaporation of the ether. The decomposition of triolein into oleic acid and glycerine may be accomplished by other means such as heating with superheated steam or with water and sulphuric acid. Oleic acid is a thin colorless oil at ordinary temperatures but solidifies when cooled to 4° C. (39° F.). Crystallizes from alcohol in silky needles melting at 14° C. (57° F.). Specific gravity at 19° C. (66° F.) is 0.897. It decomposes when heated to boiling at ordinary atmospheric pressure, but may be distilled unchanged under diminished pressure or with superheated steam. Insoluble in water, very soluble in alcohol, ether and most other organic solvents. It is a mono-basic acid forming many well defined salts, many of which are of use in the arts or in medicine. Sodium oleate is the chief constituent of castile soap; potassium oleate is found in soft soap; lead oleate is the "lead plaster" of the pharmacist. When well cooled oleic acid is treated with nitrogen trioxide it is changed to a solid isomeric, elaidic acid, which is used to some extent in making candles.

OLEINE. True oleine is the glyceride of oleic acid. Composition, $C_3H_5(C_{18}H_{33}O_2)_3$. It occurs in most vegetable and animal fats, notably in olive oil, lard and tallow. A colorless, odorless, nearly tasteless oil, insoluble in water, only slightly so in alcohol, soluble in ether. Alkalies saponify it to the alkali salt of oleic

acid (soaps) and glycerine. Nitrogen trioxide changes it to its solid isomeric elaidine. It is difficult to obtain it perfectly free from the glycerides of other acids occurring with it. The term "oleine" is applied to various commercial products, such as the liquid fats used by the soap-maker and the liquid fatty acids utilized by the candle manufacturer.

OLENEK, ô-lyë-nôk', a river of northern Siberia, which rises between Mounts Boldisno and Dsholokon and after a tortuous northeastern course of about 1,000 miles enters the Arctic Ocean 100 miles to the west of the Lena delta. It is six miles wide and 20 feet deep at its mouth, on the left bank of which is the village of Ust Olenok.

OLEOGRAPH, ô'lë-ô-gräf, an imitation of oil painting produced by means of a process similar to that of chromo-lithography. The use of embossing to imitate the rough texture of the painting is sometimes employed and the print when finished is mounted on canvas, sized and varnished to heighten the effect. The artistic value suffers through the attempt at imitation, frank reproduction coming under a different category.

OLEOMARGARINE, a mixture of fats used as a substitute for butter. Oleomargarine was invented by a Frenchman, Mège-Mouries in 1870. His idea was to produce a substance very like butter in physical properties and chemical composition that would be more wholesome than and as cheap as poor butter. He used the best of beef-suet as a basis; 1,000 parts of well washed and finely chopped fat were digested at 45° C. (113° F.) with 300 parts of water, one part of carbonate of potash and two-stomachs of sheep or pigs. After two hours the membranes had dissolved under the influence of the pepsin of the stomachs and the melted fat had risen to the surface. It was drawn off, salted and allowed to cool whereupon most of the stearin and palmitin crystallized out. This semi-solid mixture was subjected to hydraulic pressure and the fluid oleo 50-60 per cent pressed out. The oleo was churned with 10 per cent of its weight of milk together with a little butter color and the product worked up like regular butter. Many changes have been made in the manufacture of oleomargarine since its invention by Mège-Mouries. The process given below as described by Armsby (*Science*, Vol. VII, pp. 471-472) is essentially the same as that described by Armour and Swift and is a fair representative of that followed in this country. From the beef-tallow is prepared the oleomargarine oil of Mège. The caul fat of freshly killed beeves is, after thorough washing first in tepid water and then in iced water, allowed to stand in a cold room until thoroughly cold. It is then rendered at a temperature between 130° and 175° F. The resulting oil is allowed to cool slowly until a considerable portion of the stearin and palmitin has crystallized out and the pasty mass is then subjected to hydraulic pressure. The still fluid (about two-thirds of the whole) flows out into a tank of cold water, where it solidifies into a granular mass which is known to the trade as "oleo" oil or simply "oleo." The name "oil" is somewhat misleading as the product is a granular solid of a slightly yellow color. Fresh leaf lard treated in substantially the same way as the

beef tallow yields the "neutral lard" or "neutral" of the trade, also a granular solid of a white color.

The objects of this treatment are twofold, first, to produce fats as free as possible from taste or odor; second, to remove some of the difficultly fusible stearin and palmitin, in order that the finished product may melt readily in the mouth. Having thus secured the fats in the proper condition, the manufacturer proceeds to mix "oleo" and "neutral," the proportions varying according to the destination of the product; a warm climate calling for more "oleo," a cold one for more "neutral," and to flavor the mixture with butter. This flavoring is conducted in large steam-jacketed vessels provided with revolving paddles, by which their contents can be thoroughly agitated. Here the "oleo" and "neutral" are melted and thoroughly agitated with a certain proportion of milk, or sometimes of cream and a proper amount of butter-color. Forty-eight gallons of milk to 2,000 pounds of product are stated to be a common proportion. After sufficient agitation, the melted mass is run into cold water and as it cools is broken up by paddles so as to granulate the mass. After thorough washing it is salted and worked exactly like butter. The product is known as oleomargarine. Although it contains hardly more than a trace of butter, the latter flavors the whole mass so strongly that when well salted, as it usually is, it might readily pass with an inexpert or careless consumer for rather flavorless butter. Oleomargarine is the cheapest product made. By adding to the material in the agitator or "churn" more or less pure butter what is known as butterine is produced, two grades of which are commonly sold, namely, "creamery butterine" containing more and "dairy butterine" containing less butter. Certain other substances such as cottonseed-oil, sesame oil sugar, glycerine and glucose are used to some extent by a few, usually unimportant makers. On the question of the wholesomeness of artificial butter there is a wide difference of opinion, but most authorities say that a butter substitute carefully made from the fresh clean fat of healthy beeves or swine is wholesome.

The physical properties of oleomargarine are so similar to those of butter that it is very difficult to distinguish between them by any superficial test. For a good test that can be applied in the household, consult Farmers' Bulletin No. 131, United States Department of Agriculture (to be obtained for the asking from the Secretary of Agriculture). The analytical chemist is able to detect oleomargarine by making use of the fact that it contains a large percentage of fatty acids not soluble in water and a lower percentage of those volatile with water vapor than butter does. There has been both Federal and State legislation regarding this substance. The Federal law of 1886 imposed a special tax on the manufacture (\$600 per annum), the wholesaler (\$480) and the retailer (\$48). In addition the manufacturer must sell it in stamped packages, the stamps making an extra tax of two cents a pound. The act of 1902 abolished this tax of two cents but established new rates, namely, 10 cents a pound on artificially colored oleomargarine, while oleomargarine free from any color that would cause it to look like butter was rated at one-fourth of a cent a pound. The special

taxes on the maker, etc., were not changed. Most States have an extra tax of their own. They vary widely and change frequently. Some merely add a few cents a pound while others fix so high a rate or such conditions of manufacture or sale as to be practically prohibitory.

The production of oleomargarine in this country in 1888 was 34,325,527 pounds, which increased to 126,316,427 pounds in 1902. Only about 3 to 4 per cent of it was exported. Oleo-oil however, was exported in large quantity (161,651,413 pounds in 1901), more than half going to the Netherlands. In 1909 oleomargarine to the value of \$14,000,000 was manufactured in the United States; while the exports in 1914 amounted to 2,533,000 pounds valued at \$263,453; and oleo oil 97,017,000 pounds valued at \$10,157,000, most of the former going to the West Indies and of the latter to Denmark, Germany, Norway, Sweden, Belgium and Great Britain and colonies. Consult, Bannt, W. T., 'A Practical Treatise on Animal and Vegetable Fats and Oils' (Philadelphia 1896); Wiest, E., 'The Butter Industry in the United States' (New York 1916); New York Commercial Manufacturing Company, 'Oleomargarine Butter' (New York 1880); United States Department of Agriculture 'Year Book' (Washington 1895-96); United States Census 'Bulletin No. 138' (Washington 1902); United States Office of Internal Revenue 'Revised Regulations Concerning Oleomargarine' (Washington 1907).

OLEOMETER, ô-le-ôm'e-ter, a species of apparatus adapted for determining the relative densities and proportions of oils contained in seeds, nuts and other materials. The construction of the apparatus permits of a small quantity of volatile solvent being used to extract the oil, being distilled back upon the material under treatment and filtered through it successively several times.

OLÉRON, ô-lâ-rôn, France, an island in the Bay of Biscay, its nearest point two miles from the coast of the department of Charente-Inferieure, opposite Rochefort. It is 19 miles long by about five broad, and is very fertile. On it are the port of Le Château and the towns of Saint Pierre d'Oléron and Saint Georges d'Oléron. In history, the island is noted for the *Jugements ou Rôles d'Oléron*—Judgments or Laws of Oléron, a code of maritime law compiled by command of Eleanor of Guienne before she married Henry II of England, and modeled on the 'Book of the Consulate of the Sea' (a maritime code regulating commerce in the Levant). It was drawn up from the decisions of the maritime court of Oléron, in the duchy of Guienne, and was intended for the use of mariners in the Atlantic waters. It was introduced into England in the end of the 12th century and into Flanders in the 13th. The usages and decisions upon which it was based were those observed in the wine and oil trade between Guienne and the ports of England, Normandy and Flanders. The code formed the basis of modern maritime law. It was published for the first time in the 'Collections des Lois Maritimes' of M. Pardessus. An English translation was published as 'Rutter of the Sea.' See COMMERCIAL LAW.

OLEVIANUS, ô-lâ-vê-ä'-noos, Kasper, German religious reformer: b. Treves. 10 Aug. 1536; d. there, 15 March 1587. He studied law

in Paris, Orleans and Bourges, where he became acquainted with the teachings of Calvin. Further theological learning was acquired by him in Geneva and he began to teach the Reformation doctrine in Treves in 1559, and to promote the spread of the new movement under the inspiration of Calvin. This roused the hostility of the archbishop, and the reformer was compelled to retire to Heidelberg, where he was appointed member of the church consistency, and court preacher. He now in collaboration with Ursinus produced the Heidelberg Catechism. His Lutheran sympathies led Louis VI to depose him from his ecclesiastical preferments in 1576; and he went to Berleburg and thence in 1584 to Herborn, where he advocated the doctrines of the Reformation in the territories of Count von Wittgenstein and Nassau. His special contribution to the progress of the Reformation was of a practical and administrative character, and from him the Reformed churches received that Presbyterian type of organization and policy which has become permanent in Europe and America, where his method of government by synods has become universal. Consult Harbaugh, 'Fathers of the German Reformed Church'; Hagenbach, 'Väter und Begründer der Reformierten Kirche' (1857); Cuno, F. M., 'Blätter der Erinnerung an Dr. Caspar Olevianus' (Barmen 1887).

OLFACTORY NERVE, or OLFACTORY SENSE. See NOSE AND THROAT.

OLGA, Saint, a popular saint of the Russian Church. She was a peasant girl taken to wife by the Grand-duke Igor of Kiev, who met her by chance when on a hunting party in Pskoff. She possessed remarkable talents and an exalted character. After her husband had lost his life when returning from an unsuccessful expedition to Constantinople (945), she managed the government for his son, Sviatoslav, a minor, until he came of age in 955. Then going to Constantinople, she was baptized by the Patriarch Theophilactes and took the name of Helena. On her return to Russia she labored earnestly and successfully for the propagation of the Christian faith. After her death in 969 she was canonized by the Greek Church under her original name and her festival is kept on the 11th day of July (O. S.). Consult Castremont, D'Elissalde, 'Histoire de l'Indroduction du Christianismo sur le continent russe, et la vie de Sainte Olga' (Paris 1879).

OLIBAN (OLIBANUM), a gum-resin which flows from incisions in certain species of *Boswellia*, a genus of trees of the family *Burseraceae*, noted for the production of aromatic gums, growing on bare rocks in the mountains of southern Asia and northeastern Africa. Olibanum is the *lebanah* of the Hebrews, *libanos* or *libanotos* of the Greeks, thus of the Romans, of all which terms the ordinary English translation is "frankincense" (q.v.). It is produced mainly by *B. serrata*, a large tree growing on dry and rocky ridges from Abyssinia and southern Arabia to northern India; but the best oliban comes principally from Somaliland and from Arabia. Aden is the chief point of collection, exporting from 1,500,000 to 2,000,000 pounds annually, much of which goes to India and China. The gum occurs in commerce in semi-transparent yellowish

tears and masses; has a bitter nauseous taste; is hard, brittle and capable of being pulverized; and diffuses a strong aromatic odor when burned. It was formerly used in medicine, but now is chiefly employed as incense in Roman Catholic churches and Indian and Chinese temples. It contains 56 per cent of resin soluble in alcohol, 30 per cent of gum soluble in water, and from 4 to 8 per cent of an aromatic oil. Another species of *Boswellia* supplies in India an inferior gum of similar properties, both used as incense and as a substitute for pitch.

OLID, Cristóbal de, krēs-tō'hāl dā ò-lēd', Spanish soldier: b. about 1490; d. Naco, Honduras, 1524. He was brought up in the retinue of Diego Velázquez, governor of Cuba, who in 1518 sent him with a small force to find Grijalba, of whom nothing had been heard since his setting out for Yucatan. In Yucatan he met Cortes and was induced by him to desert Velázquez and join the other in his adventurous schemes. In 1524 was captured and beheaded by one of Velázquez's kinsmen.

OLIER, ô'lyá', Jean Jacques, French priest: b. Paris, 20 Sept. 1608; d. there 2 April 1657. He was educated at the Jesuit College of Lyons, the College of Harcourt and at the Sorbonne. He was ordained priest in 1633 and in company with other priests traveled through Suvergne and Velay as a missionary. His reputation reached Louis XIII and through the advice of Richelieu Olier was appointed coadjutor of the bishop of Châlons-sur-Marne, an honor he declined in order to carry out his project of founding a seminary for priestly education. In 1642 he established a seminary at Vaugirard, near Paris, and gradually gathered other priests to aid the work. Later in the year he was appointed to the charge of Saint Sulpice, Paris, a parish notorious for its evil practices. Olier accepted the charge without abandoning the seminary and succeeded in making Saint Sulpice a model parish. He made a determined stand against duelline and brought to his support a number of the most valiant among the nobles, who took a vow not only to refrain from giving or accepting challenges but to refuse to act as seconds. The Seminary of Saint Sulpice was chartered in 1645, and in 1655 the cornerstone of the church of Saint Sulpice was laid. Other seminaries under Olier's direction were founded at Clermont, Le Puy, Viviers, Bourg, Saint Andéol, and Montreal, Canada. Consult 'Vie de M. Olier, Fondateur du Séminaire de Saint Sulpice' (1853); Jervis, 'History of the Church of France' (Vol. 1).

OLIGARCHY, a form of government in which the supreme power is vested in a small class of persons. See GOVERNMENT.

OLIGOCENE, in geology, a name introduced by Beyrich (1855) for beds in North Germany, especially at Mainz, including portions of formations of the upper Eocene and the lower Miocene, and so forming a fourth subdivision of the Tertiary (q.v.), namely into Eocene, Oligocene, Miocene and Pliocene. The rocks of the Oligocene are freshwater, brackish, or marine in origin and display a quasi-tropical flora; they occur in the Paris Basin, in Switzerland, where they are called Molasse, and rather rarely in North America, where the more important beds identified with the Oligocene occur

in the Northwest Territory, North Dakota, along the White River, and from Florida to Texas, the last being styled the Vicksburg beds by Conrad and the Orbitoidic beds by Heilprin, who first called attention to the frequent occurrence in it of a fossil foraminifer, *Orbitoides mantelli*.

OLIGOCHÆTA, ôl-î-gō-kē-tā, a suborder of chætopod annelids (see CHÆTOPODA) of which the earthworm (q.v.) is the most familiar example. The species are almost solely inhabitants of the earth or of fresh water, have the segments of the body similar, and differ from the marine chætopods (*Polychæta*, q.v.) in their greater simplicity of structure. They lack all appendages — cirri, palpi, tentacles, as well as parapodia, the bristles arising directly from the body-wall, either distributed regularly or arranged in four bunches on each segment. Usually eyes are lacking and there is no metamorphosis in development. These animals are hermaphroditic, and usually some of the segments are markedly glandular, forming a girdle (clitellum) which secretes the cocoon in which the eggs are laid. The group is divided into the aquatic or parasitic species (*Limicola* or *Microdrile*) and the terrestrial forms (*Terricola* or *Macrodrile*). The aquatic species are mostly minute.

OLIGOCLASE (Greek, "slight fracture"), one of the feldspar unisilicates, with the possible formula $(\text{CaNa}_2)\text{Al}_2\text{Si}_6\text{O}_{28}$. It crystallizes in the triclinic form, but with angles very near to those of the monoclinic feldspar orthoclase (q.v.); has a single clean fracture; is not affected by acids; varies in color from white to greenish; has a specific weight of 2.62–2.65 and a hardness of 6; occurs in granite and other early rocks in Switzerland, Germany, Sweden and in the United States in New Hampshire, Connecticut, North Carolina and elsewhere. A reddish variety with fine iron oxide crystals is used as a gem and is called sun stone.

OLIN, Stephen, American Methodist clergyman: b. Leicester, Addison County, Vt., 7 March 1797; d. Middletown, Conn., 16 Aug. 1851. He was graduated at Middlebury College, Vt.; was appointed principal of the Tabernacle Academy, South Carolina, and subsequently entered the ministry of the Methodist Episcopal Church. In 1826 he was appointed professor in the University of Georgia. In 1833 he was transferred to the Virginia Conference, and elected president of Randolph Macon College. Later he spent some time in foreign travel, and in 1842 became president of Wesleyan University, Middletown, Conn. He was an impressive preacher, and a prominent advocate of the evangelical alliance. He wrote 'Travels in Egypt, Arabia Petrea, and the Holy Land' (1843); 'Greece and the Golden Horn' (1854); 'The Relations of Christian Principle to Mental Culture' (1848), and several works of essays which appeared posthumously. Consult his 'Life and Letters' (1853).

OLINDA, ô-lên-dā, Brazil, a seaport town of Pernambuco, five miles north of the city of Pernambuco, which replaced it as the capital and commercial centre of the state, after the Dutch burned Olinda in the 17th century. Olinda was founded in 1535. For a long time it was the most important city of northern

Brazil. In addition to being the capital of the province of Pernambuco it was also the administrative headquarters of the Dutch Colony established there in the 17th century. Long after it ceased to be the provincial capital it remained the favorite residence of old and wealthy families. Pop. 12,000.

OLIPHANT, ôl'î-fant, Laurence, English traveler and author: b. Cape Town, South Africa, 1829; d. Twickenham, near London, 23 Dec. 1888. He was the son of a chief justice of Ceylon, and after a boyhood spent in England went to Ceylon in 1841 and was subsequently private secretary to his father. Although later called to the bar he spent much of his time in travel, visiting the Crimea in 1852, and Canada and the United States (1853–54) as private secretary to Lord Elgin, and in 1855 he served under Omar Pasha in the Crimean War. The next year he joined Walker, the filibuster, at New Orleans, and was attached to Lord Elgin's China mission 1857–59. The year 1860 saw him with Garibaldi in Italy and the year after he was first secretary of legation at Yeddo, Japan, where he was wounded by assassins. He afterward traveled in Egypt, Poland and Palestine. He sat in Parliament for the Stirling Burghs 1865–67, but having by this time come under the influence of the mystic, Thomas Lake Harris (q.v.), he resigned his seat and entered the brotherhood which Harris had founded at Brocton, Chautauqua County, N. Y. At Brocton, under the orders of Harris, he was forced to do the hardest kind of farm labor, and there his mother joined him, but was not permitted to hold any confidential intercourse with him. Both mother and son gave up their private means to the community. In 1870 Oliphant returned to Europe and was *Times* correspondent during the Franco-Prussian War. In 1872 he married and the next year, with his wife and mother returned to Brocton. All three of the Oliphants were now the obedient slaves of Harris, and while his wife and mother were employed in menial duties Oliphant was called upon to engage in commercial enterprises for the good of the community. Husband and wife were presently separated by the command of the inexorable Harris, the wife being removed to a branch of the community in California. At last, in 1882, they emancipated themselves from the Harris influence, and after more wandering Oliphant finally settled at Haifa, in the Bay of Acre, and busied himself with schemes for assisting the Jews to return to Palestine. Although he had broken with Harris he still retained visionary beliefs not easy to define. In spite of his singular mysticism he was a shrewd man of business, a polished man of the world, and a writer of rare talents. Among his many books are 'A Journey to Khatamandu' (1852); 'The Russian Shores of the Black Sea' (1853); 'Earl of Elgin's Mission to China and Japan' (1857–59); 'The Tender Recollections of Irene McGillicuddy' (1878); 'Piccadilly,' a novel (1865); 'Altiora Peto' (1883); 'Sympneumata' (1886); 'Mas-solam' (1886); 'Episodes in a Life of Adventure' (1887); 'Haifa, or Life in Modern Palestine' (1887); 'Masollam' (1888); 'Scientific Religion' (1888). Consult 'Memoir of Laurence Oliphant and Alice, his Wife,' by Mrs. Margaret Oliphant (1891).

OLIPHANT, Margaret Wilson, novelist and biographer: b. Wallyford, near Musselburgh, Scotland, 4 April 1828; d. Wimbledon, Surrey, England, 25 June 1897. She was a cousin of Laurence Oliphant (q.v.). She removed with her parents to Liverpool in childhood and in 1852 was married to her cousin, Francis Wilson Oliphant, an artist in stained glass, who died in 1859, leaving her with three children and no means to support them except her pen. She began literary work early, publishing 'Passages in the Life of Mrs. Margaret Maitland' in 1849, and this was quickly followed by several other tales of Scottish life. After the death of her husband her family was supported entirely from the earnings of her pen, and during her long literary career she published 120 books and quite as many contributions to *Blackwood's Magazine* in the shape of reviews, etc. Few women of her time have surpassed her in the amount of work accomplished and the even excellence of what she wrote. Of her many novels among the best are those comprising 'The Chronicles of Carlingford' (1863-76) — of which 'Salem Chapel' (1863) and 'Miss Majoribanks' (1866) are the most important, — 'Within the Precincts' (1879); 'Harry Joscelyn' (1881); 'The Ladies Lindores' (1883); 'The Sorceress'; and 'The Cuckoo in the Nest' (1892). She was not a great novelist, for she lacked constructive power, and her plots are not always effective; but her careful and sympathetic analysis of character, her humor, pathos, invention and naturalness entitle her to a high place among novelists of the second rank. Of several tales of the supernatural by her 'A Little Pilgrim in the Unseen' (1882), is the best known, but is surpassed in power by 'A Be-leaguered City' (1880); and 'Old Lady Mary' (1884). In addition to her work in fiction she produced a large number of biographies and works of literary history, such as the 'Life of Edward Irving' (1862), a remarkable piece of sympathetic biography; 'The Makers of Florence' (1874); 'The Literary History of England 1790-1825' (1882); 'Life of Laurence Oliphant' (1883); 'The Victorian Age of English Literature,' with her son F. R. Oliphant (1892); 'Historical Characters of the Reign of Queen Anne' (1894); 'Annals of a Publishing House' (1897); etc. In spite of much sorrow in her life her outlook upon existence was cheerful and tolerant, and her influence upon English fiction was wholesome in every respect. For a half century her admirable fictions were the delight of a wide circle of cultivated readers in this country and her own, and her 'Chronicles of Carlingford,' at least, have in them something of the same quality which renders 'Trollope's Dorsetshire tales so enduring. Consult 'Autobiography and Letters of Mrs. Oliphant' edited by H. Coghill (1899). Consult Coghill, Mrs. H., 'The Autobiography and Letters of Mrs. M. O. W. Oliphant' (New York 1899).

OLIVAREZ, Gaspar de Guzman, COUNT or, *gás'pär dā gooth-män ô-lē-vā'rēth*, Spanish statesman: b. Rome, 6 Jan. 1587; d. Toro, Spain, 22 July 1645. He was educated at the University of Salamanca, was a gentleman of the bed-chamber to the Prince of Asturias, and gained the favor of his royal master to such an extent that soon after the latter succeeded to the

throne as Philip IV, Olivarez was appointed Prime Minister. For 22 years (1621-43) his power was almost unlimited. He was Duke of San Lúcan Barrameda, and was known as the "COUNT-DUKE." His sole object soon became the extortion of money from the people to supply the expenses of the war with Holland, France and other powers. His severity occasioned revolts in Catalonia and Andalusia, and the Portuguese threw off the Spanish yoke, and acknowledged the Duke of Braganza king in 1640. The foreign wars were so fatal to Spain, whose armies were defeated by the French, and whose fleets were destroyed by the Dutch, that the king was compelled by universal public discontent to dismiss Olivarez in 1643. Consult Cánovas del Castillo, Antonio, 'Estudios del Reinador de Felipe IV' (Madrid 1889); Silvela, F., 'Cartas de Sor Maria de Agreda y del rey Felipe IV' (Madrid 1885).

OLIVE, PRINCESS OF CUMBERLAND, title assumed in 1821 by Mrs. Olivia Serres: b. Warwick, 3 April 1772; d. 21 Nov. 1834. Her maiden name was Wilmot; she married John Thomas Serres in 1791 and was separated from him in 1803. She wrote poetry and fiction and several pamphlets (1813-17) urging the claim of her uncle, James Wilmot, to be the author of 'Junius Letters.' In 1821 she was arrested for debt, and moved a stay as being daughter of the Duke of Cumberland. She asserted that £15,000 had been left her by George III, who recognized her as Cumberland's daughter, but she died without being able to see the king's will. Her claims were continued by her daughter Lavinia (1797-1871), who married Thomas Ryves, a portrait painter, was divorced from him in 1841, and in 1866 procured a verdict that her mother was not the daughter of the Duke of Cumberland. This *cause célèbre* was built upon most outrageous forgeries, but both Mrs. Serres and Mrs. Ryves succeeded in interesting Sir Gerald Noel and others in their pretensions.

OLIVE THORNE, American writer on ornithology. See MILLER, HARRIET MANN.

OLIVE, one of the leading fruits of the world. It is borne by a small tree (*Olea europæa*) of the order *Oleaceæ*, and is the most important member of its genus, which includes between 30 and 40 species. This tree is a native of western Asia and probably of the Mediterranean region, and attains a height of about 25 feet, bears small lanceolate evergreen leaves and axillary racemes of fragrant yellowish-white flowers followed by oblong or ovoid fruits (drupes). From remote antiquity it has been cultivated as a food-plant, especially for the oil pressed from its fruits. Throughout the coast of the Mediterranean the olive has been grown upon a commercial basis for many centuries, individual trees being known to be more than 1,000 years old. It was introduced during the 18th century into California, which is now the leading olive-producing district of the United States, but part of Arizona and New Mexico are adapted to olives and are gradually coming into notice. The assumption is made that seed was introduced in 1769 from Mexico and planted at the San Diego Mission, whence cuttings were taken to other missions throughout California; and this olive, the only one known in the State until about 1880, was called the

"Mission" variety. Since 1880 numerous varieties have been introduced from olive-growing countries of Europe.

The olive succeeds best in warm, dry climates. It will withstand some frost, but at blossoming time this is believed to impair if not to destroy the crop; and the same result is often attributed to high wind and very dry air at that time. A rich, well-drained soil is preferred, but the tree will succeed and produce excellent crops upon a very great variety of soils; it is usually a mistake, however, to plant it upon rocky hillsides, as too numerous failures in California prove. While not exacting as to food, the trees must have an adequate fertilizer. To return to the soil of the pomace after the oil has been expressed, together with slight dressings of commercial fertilizers and judicious cultivation, will keep the trees in lusty bearing condition. The trees are usually set about 30 feet apart either in hexagons or in squares, the former plan being preferred in California because it is more economical of land, and permits of plowing in three directions instead of only two. The land is kept cleanly cultivated throughout the season.

The olive is propagated by layers, suckers, sprouts, cuttings, tips of twigs, grafts, buds and seeds. The last three, being tedious and slow, are rarely employed. The favorite method is by means of tips. These are obtained from small dormant branches, partly defoliated, rooted in moist sand and then transplanted in nursery rows. The trees should begin to bear when about eight years old and reach full productivity when about 30.

Olive Oil.—The principal uses of the olive are for oil production, for pickling, either green or ripe, and for drying. For the production of oil, the ripe fruits are carefully gathered by hand, bruised as little as possible and preferably crushed at once, otherwise they are partially dried in very thin layers through which air must circulate freely to avoid molding and fermenting, unsound fruit being prone to decay and impair the flavor and odor of the oil. An old practice was to crush the fruit by means of heavy mill-stones in pits, but the oil thus extracted from the kernels has been found to injure both the flavor and the keeping quality of the oil obtained from the pulp. Modern crushers, therefore, do not break the stones. The crushed pulp is then pressed in linen sheets, the pressure being applied very gradually. A second pressing is made after the pulp has been mixed with cold water. Other pressings are sometimes given, each one resulting in a grade of oil inferior to the preceding. The two first grades are sometimes mixed. Since the separation of the oil from the juice by gravity is hazardous on account of liability to ferment, the impurities are washed out quickly by special apparatus in which a current of cool water comes in contact with a small quantity of the juice; mixes with it, separates the larger particles of pulp and allows the oil to rise through a tall column of water which further washes the oil-globules as they rise. After being allowed to stand for a time in a cool room this oil is racked off and sold as "new oil," or may be again allowed to stand for further clarification. Since the American market demands a clear oil, however, much of the domestic oil is filtered, a process which, especially if often re-

peated, impairs the flavor and makes the oil seem greasy. Throughout the process, scrupulous cleanliness is essential, because olive oil is prone to absorb any taint either in the utensils or in the air. The oil is pale yellow, inodorous, and has a specific gravity of .918 at a temperature of 15° C. It is largely used in cookery and pharmacy, for lubricating and illuminating purposes, and for making Castile and other kinds of soap, for which purpose the lower grades are most employed. In the United States it is often adulterated with cottonseed-oil. Gallipoli oil, which is used in dyeing, is made from the fermented fruit.

Olive oil also has important medical uses. In doses of from one to two ounces for adults, and one teaspoonful for infants, it acts as a laxative. It is also used in intussusception of the bowels; as an antidote in cases of acrid poisoning; as a local neutral protective from the atmosphere; in place of suet, lard, etc., as an inunction to increase the fat of the body, or to reduce the heat of the skin, and by workmen in lead factories as a laxative, and to prevent the absorption of lead. Combined with camphor, morphine, etc., it is applied to wounds, burns and bruises, and forms the basis of many liniments. It is used to allay the pain of insect bites, and (warmed) in the ear, to destroy insects. It is also employed as an application to swollen breasts, as a lubricant of surgical instruments, sounds, pessaries, etc., and as an injection in cases of constipation; but for this last purpose it is inferior to castor oil. In large doses, it is believed by some physicians to hasten the discharge of gall-stones, sometimes apparently softening them.

Pickled Olives.—For pickling the fruits are gathered by hand before they are likely to become soft during the process, a degree of maturity not readily described except by saying that the time is just before the fruits would change from green to the mature fruit tint, which varies with the variety from yellow to almost black. They are first placed either in pure water, which must be changed each day, or in a weak solution of lye. This is to remove the bitterness and acidity and to soften the skin. After the latter process, which may occupy from one to three months, the lye is removed by soaking in pure water. Then the olives are subjected to a series of immersions in salt solutions of gradually increasing strength, the maximum being dense enough to float an egg. They will now keep for years if properly stored. Pickled green olives are much less a food than a table delicacy or relish; but pickled ripe olives, which are prepared by much the same process and are gaining in favor, are considered primarily as a food. However, there is little difference in their food value. Dried olives are popular in some Mediterranean countries, but are little known in the American market.

The average composition of pickled green olives is: water, 58; fat, 27.6; carbohydrates, 4.3; protein, ash, etc., 7.8; that of pickled ripe olives: water, 65.1; fat, 25.5; carbohydrates, 3.8; protein, ash, etc., 5.6.

Besides the species mentioned above, several other related species are valued more or less. *Olea chrysophylla*, a tropical African species, has been introduced into southern California, where it is planted for ornament, the

under surfaces of the leaves being bright golden yellow. *Olea*, or *Osmanthus, fragrans*, is the fragrant olive of China and Japan, where its flowers are used for perfuming tea. It is also cultivated in greenhouses for its inconspicuous but exceedingly fragrant flowers.

In ancient Greece the olive was sacred to Pallas Athene and was a symbol of chastity and peace. Like the laurel it was used for making wreaths for crowning the victors in athletic sports. Olive wood is very hard and beautifully grained, and is valuable for cabinet work.

Olives vary in size from 100 to more than 400 to the pound. The exports of the United States are about 6,000,000 gallons of oil and 5,000,000 gallons of green olives. The United States production of olive oil in 1912 amounted to 350,000 gallons.

B., 'Olive Culture in the United States' (*United States Department of Agriculture, Yearbook* 1896).

OLIVE-BACKED THRUSH, an American thrush. See THRUSH.

OLIVE-SHELL, the polished and often beautifully colored shell, of nearly the size and shape of an olive, of a marine gastropod mollusk (family *Olividae*), allied to the volutes and cones, many species of which inhabit the warm seas, creeping about the bottom in search of animal food at considerable depths. The front of the foot is developed into a strong sort of fender, and fleshy flaps (mesopodium) are reflected laterally over the shell. An allied genus of smaller size is *Olivella*, one species of which has been used in the South Pacific islands as a kind of shell-money. Consult Cooke, 'Mollusca' (1895).

OLIVEIRA MARTINS, ô'lê-vā'rā mār-têns, Joaquim Pedro de, Portuguese author: b. Lisbon, 1845; d. 24 Aug. 1894. He entered commercial life at 14 but continued his studies and in 1870 he became manager of the mine of Saint Eufemia near Cordova. It was during this period that he wrote 'O. Socialismo.' In 1874 he returned to Portugal as administrator of the railway from Oporto to Povoá. He had meantime seriously devoted himself to the study of economics, geography and history, and his 'A Circulação fiduciária' (1871), received the gold medal of the Royal Academy of Sciences at Lisbon as well as gaining for him membership in that institution. He was elected president of the Society of Commercial Geography of Oporto in 1880, and in 1884 became a director of the Industrial and Commercial Museum there. He entered Parliament in 1886, and in 1888 he removed to Lisbon where he became editor of the *Reporter*. He became administrator of the Tobacco Régie in 1889. He was his government's representative at international conferences at Madrid and Berlin in 1890; and for his address at the fourth centenary of Columbus at Madrid in 1891 he was awarded membership in the Spanish Royal Academy of History. He was appointed Minister of Finance in 1892 and sub-

sequently was vice-president of Junta do Crédito Público.

Together with his many activities in business and public life he attained a position of leadership in the literature of Portugal during the last half of his life. He was a man of high moral character and perceptions, an ardent patriot and gifted with keen psychological sense as well as a broad and sympathetic grasp of sociological conditions. He possessed as well vivid imaginative powers, an easy grace of expression and a knowledge of history which gave him an important share in the literary revival his country experienced in the latter part of the 19th century. Author of 'Bibliotheca das sciencias sociais' (1881-93); 'Elementos de anthropologia' (1880); 'Historia da civilização ibérica'; 'Historia de Portugal'; 'Historia da republica Romana'; 'Portugal contemporaneo'; etc. Consult Barreto, M., 'Oliviera Martins' (1887); D'Ayalla, F. D., 'Os Ideás de Oliviera Martins' (1897); De Quental, A., 'Oliviera Martins' (1894).

OLIVENITE, natural hydrated arsenate of copper, occurring in most copper ores. It varies in color from brown to green, and in form from crystal, usually oblique tetrahedral prisms, the common form in the English copper mines, to amorphous, being then styled "wood copper" or "wood arsenate" because of its fibrous nature. Both forms occur in the Utah copper mines.

OLIVER, Andrew, American colonial official: b. Boston, 28 March 1706; d. there, 3 March 1774. He was graduated at Harvard College in 1724, was elected to the general court and became secretary of the province. He was a brother of Peter Oliver, chief justice of Massachusetts. When the Stamp Act was passed by the English Parliament he made himself obnoxious by accepting the office of distributor of stamps, and on 14 Aug. 1765 was hanged in effigy from the "liberty tree." In the evening of the same day the mob cut down the effigy and burned it in front of Oliver's house. Oliver was so much alarmed that the next day he publicly resigned his office. In 1771 he was appointed lieutenant-governor, succeeding his brother-in-law, Hutchinson, and pursued the same public course, promoting, as far as possible, the plans of the British ministry. This was proved by his letters obtained by Franklin in England and sent back to America in 1772. When, therefore, the general court petitioned the king for the removal of Hutchinson, Oliver's name was also included. The petition was refused, but Hutchinson was let out of office very shortly after the death of Oliver.

OLIVER, Frank, Canadian journalist and statesman: b. Peel County, Ontario, 1853. He went to Manitoba in 1873 and to Edmonton in 1876, and in 1880 he established the *Edmonton Bulletin*. He served in the northwest council in 1883-88 and in the legislative assembly which succeeded the council in 1888-96. In 1896 he was elected to the Canadian House of Commons for Alberta, and in 1905-11 was Minister of the Interior under Sir Wilfrid Laurier. He afterward represented Edmonton in the house.

OLIVER, George Tener, American lawyer: b. Ireland, 26 Jan. 1848; d. 22 Jan. 1919. He was of American parentage and was educated at

Bethany College, West Virginia. He was admitted to the bar in 1871 and in 1871-81 was engaged in practice at Pittsburgh. He later entered the iron and steel industry, and after 1900 he was publisher of the *Pittsburgh Gazette* and the *Pittsburgh Chronicle Telegraph*. He was elected to the United States Senate in 1909, serving out the unexpired term of Senator P. C. Knox, and in 1911 he was re-elected.

OLIVER, Henry Kemble, American musician: b. Beverly, Mass., 24 Nov. 1800; d. Boston, Mass., 10 Aug. 1885. He was a boy soprano in the choir of Park Street Church, Boston, and was graduated at Dartmouth College in 1818. He was mayor of Lawrence, Mass., in 1859, and in 1861-65 he was treasurer of the State of Massachusetts. He was afterward mayor of Salem, and in 1880 removed to Boston, where he lived thenceforth. He was organist and musical director of churches in Lawrence and Salem; and founded a Glee Club and a Mozart Association in Salem. He wrote 'The National Lyre' with others (1848); 'Collection of Church Music' (1860); 'Original Hymn Tunes' (1875); 'Federal Street' (1832); sung at Boston Peace Jubilee, 1872; the hymns, 'Morning'; 'Harmony Grove'; 'Merton'; etc. He also wrote a 'Te Deum' and several motets and chants.

OLIVER, James, plow manufacturer and inventor of the chilled plow: b. Scotland, 28 Aug. 1823; d. South Bend, Ind., 2 March 1908. He came to America in 1835 with his parents, who, after residing for a year in Seneca County, N. Y., settled in Mishawaka, Ind., in 1836. He learned the trade of a molder, and in 1855 began the manufacture of plows at South Bend, Ind., founding the establishment of which he became president. After years of exhaustive study and expensive experiments he invented the first successful chilled plow, which made his name famous throughout the world. See Plow.

OLIVER, James Edward, American mathematician: b. Portland, Me., 27 July 1829; d. Ithaca, 27 March 1895. He was educated at Harvard, became an assistant on the *American Nautical Almanac* and later was appointed assistant professor of mathematics at Cornell University, succeeding to the chair after two years. He was a member of the American Academy of Arts and Sciences, the American Philosophical Society and the National Academy of Sciences; author of 'A Treatise on Trigonometry' (1886).

OLIVER, Peter, American jurist: b. Boston, 26 March 1713; d. Birmingham, England, 13 Oct. 1791. He was a brother of Andrew Oliver (q.v.), and was graduated at Harvard College in 1730; held several offices in Plymouth County, Mass., and in 1756 was appointed a justice of the Superior Court, although he had never become a lawyer. In 1771 he was made chief justice. Oliver was a Loyalist, and when, in 1774, the legislature ordered the judges to refuse a fixed salary from the king, he alone declined to comply and was impeached in consequence. He wrote in favor of the British rule in a Loyalist publication called the 'Censor,' and went to England in 1776, when the British troops evacuated Boston. There he passed the remainder of his life. He possessed

considerable literary skill and was a collector of antiquarian materials.

OLIVER TWIST, begun while Dickens was still at work on 'Pickwick Papers' and published in 1837-38, was one of the earliest and is still among the best known and widely read of the author's novels. Almost more than any other of his stories, except 'Pickwick,' it is modeled upon that loose agglomeration of adventures known as the picaresque novel, most familiar to English readers in such stories as Smollett's 'Roderick Random' and 'Peregrine Pickle,' and of which the best known examples are 'Gil Blas' and 'Don Quixote.' It is, however, much more beneficent and moving than most of its prototypes and is full of sympathy and pathos. Oliver Twist, a waif, after being half-starved and ill treated in an orphan asylum, runs away to London, where he falls in with and is exploited by the underworld of the Jew, Fagin; Charlie Bates, the Artful Dodger; Bill Sikes and other disreputable people, but is finally rescued through the providential advent of the kindly disposed people of whose colorless amiability the Cheeryble brothers in 'Nicholas Nickleby' are the best known. Oliver finally appears to be a scion of respectable stock and the villains of various descriptions are condignly discomfited by a considerable variety of arrests, terrors, murders and mortal accidents. The story is one of the most rapidly moving and affecting of Dickens' earlier works in its sympathy with oppressed childhood, and the figures of the underworld are usually thought to be among the most interesting in Dickens' great gallery of such characters. Those of Bill Sikes and Nancy are particularly realistic, and though Fagin, Bumble and some of the others are somewhat grotesque, they have become household words. The higher classes are, as usual in Dickens' novels, less convincingly drawn and far less real.

WILLIAM T. BREWSTER.

OLIVERS, Thomas, British Methodist preacher: b. Tregynon, Wales, 1725; d. London, March 1799. He received little education and earned a scanty livelihood as a cobbler. Upon hearing Whitefield preach at Bristol he was converted, became a preacher of the Methodist Society at Bradford, Wiltshire, and later came under the supervision of Wesley. He spent the years 1753-75 as a traveling preacher, and in 1775-79 he was supervisor of the Methodist press, a position for which he had not the necessary education and from which he was removed. He afterward lived in retirement in London, and was buried in Wesley's tomb. He wrote numerous tracts, but his hymns were more important and his 'The God of Abraham praise' is still included in the best collections.

OLIVES, Mount of, or MOUNT OLIVET, the historic hill on the east side of Jerusalem, separated from the city by the valley of Jehoshaphat and the brook Kedron, and rising to a height of over 2,700 feet. It is celebrated as the scene of many Biblical incidents, especially in the ministry of Jesus Christ. It has four eminences extending from north to south, known respectively as Galilee or Viri Galilæi, Mount of Ascension, Prophets and Mount of Offense. The northernmost of these derives the name by which it is known among

Christians from the fact that it is supposed to be the hill on which two angels addressed the apostles after the Ascension, as "Ye men of Galilee." The next in order, proceeding southward, gets its name of Mount of Ascension from the supposition, originated by the Empress Helena, that this was the scene of our Lord's ascension, a supposition at variance with the narrative of Luke (xxiv, 50, 51), where it is said that Christ "led them out as far as to Bethany." This was the most important of all the eminences. At its foot lay the Garden of Gethsemane. The next eminence southward is rather a portion of the previous one than a separate height, and is remarkable for containing a celebrated catacomb, known as the "Tombs of the Prophets" (perhaps in allusion to the words of Christ in Matt. xxiii, 29). The southernmost eminence is called the Mount of Offense, because it is supposed to be the "Mount of Corruption" on which Solomon erected the high places for strange gods (1 Kings, xi, 7; 2 Kings, xxiii, 13). On the hill is the small village of El Tour on the north of which is the Chapel of the Ascension belonging to the Mohammedans but used on festival occasions by Christians. On the east are several Russian buildings, including a handsome church, a hospice for pilgrims and a tower from which a magnificent view is obtained, especially of the Dead Sea, Jordan Valley and surrounding country. South of the village are the Paternoster Church, or Church of the Lord's Prayer, belonging to the Roman Catholics, and also a Carmelite convent. Modern olive trees represent the historical trees from which the mount derived its name, and which were cut down during the siege of Jerusalem 70 A.D. From the village of El Tour a road to the southeast leads to Bethany, passing Bethphage.

The Mount of Olives seems to have been a sacred place back in the semi-heathen days when it appears to have been devoted to the worship of the moon. The mount was known in later days as the Mountain of Light and on it a beacon was lighted to announce the coming of the new moon. This practice was kept up in even later days of the Jewish sovereignty. Consult Baedekes, 'Palestine and Syria' (London 1906); Hofman, 'Galileae auf dene Oldberg' (Leipzig 1896); Leary, L. G., 'The Real Palestine of Today' (New York 1911).

OLIVET, Mich., founded in 1844 and incorporated in 1866, is mainly important as the seat of Olivet College, a coeducational and non-sectarian institution, founded in 1844 by John J. Shipherd, as Olivet Institute and chartered as a college in 1859. It is closely allied with and under the management of the Congregationalists. Besides the regular preparatory and collegiate courses, the curriculum offers courses in pedagogy, the sciences, biology and music. The college confers the degree of A.B. The main buildings are Parsons Hall, Shipherd Hall, Mather Hall, a building for the laboratories and the biological museum and Burrage Hall, the home of the library, which in 1905 contained 30,000 volumes. There is also a small gymnasium and the campus contains 15 acres. The Olivet Congregational Church is the church chapel and is the joint property of the college and church. The property of the college in buildings and endowments was valued

in 1910 at \$350,000; the faculty numbered 26; students, 260, and graduates, 732.

OLIVETANS. See ORDERS, RELIGIOUS, OF THE WORLD.

OLIVINE, natural silicate of iron and magnesium (Mg_2FeSiO_4), also called peridot and chrysolite, occurring in lava and as a principal constituent of basaltic rocks. It is rhombic and holohedric, of hardness $6\frac{1}{2}$ -7 and of specific gravity 3.3-4. It is possibly an original magnesian component of rocks now altered to serpentine. Olivine is transparent, olive green or brown, with a colorless streak and conchoidal fracture.

OLLA PODRIDA, òl'y'a pō-drē'da (Sp., literally, rotten or putrid pot), a popular Spanish dish consisting of various kinds of meat stewed with vegetables. The term has also been applied to any incongruous mixture, particularly literary collections, to which the word hodgepodge might similarly be employed.

OLLENDORF'S SYSTEM, an educational term applied to a 19th century method of learning languages, invented by H. G. Ollendorf (1803-65), and designed for those who teach themselves. The grammars are intended to give the students a mastery of the conversational forms of language, grammatical rules being few.

OLLION, Henri, French educator: b. Boisle-Roi, France, 1 April 1878. He was educated at the Jesuit colleges of Lyons and Avignon and the universities of Tübingen, Leipzig, Lyons and Paris. He was successively master of conferences and after 1909 professor of philosophy at the Catholic University of Lyons and professor of philosophy at the Institute for the Higher Education of Young Girls, Lyons. In 1914 he was commissioned captain of the 213th Infantry regiment and was awarded the Croix de Guerre. He published 'Philosophie de la grammaire' (1900); 'Lettres inédites de Locke à Thoynard, et notes sur la correspondance de Locke' (1908); 'La philosophie générale de John Locke' (1909); 'Lettres inédites de Locke à Thoynard, Limborch et E. Clarke,' with M. de Boer (1912). M. Ollion is a contributor to the 'Catholic Encyclopedia,' the *Revue de Philosophie*, the *Revue des Facultés Catholiques de Lille*, etc.

OLLIVANT, òl'i-vănt, Alfred, English novelist: b. 1874. He was educated at Rugby and at the Royal Military Academy at Woolwich, and was commissioned in the Royal Artillery in 1893, resigning in 1895. He subsequently devoted himself to literature, his first book, 'Owd Bob' (1898), published in America as 'Bob, Son of Battle,' achieving a remarkable success. His later works have sustained his reputation as a writer of high merit. Author of 'Danny' (1903); 'The Redcoat Captain' (1907); 'The Gentleman' (1908); 'The Taming of John Blunt' (1911); 'The Royal Road' (1912); 'The Brown Mare' (1916); 'Boy Woodburn' (1918).

OLLIVIER, ô-lê-vê-ă, Olivie Émile, French statesman: b. Marseilles, 3 July 1825; d. 20 Aug. 1913. He studied law and began the practice of his profession at Paris in 1848. Having taken part in the Revolution of 1848, he was appointed commissary-general at Marseilles under the republic, afterward becoming

prefect at Bouches-du-Rhône and then of Haute-Marne. In 1857 he entered the legislative assembly, where he became one of the leaders of the Liberal opposition and was one of "The Five" who were distinguished for eloquent and often successful opposition to the policy of Napoleon III. Gradually, however, he severed himself from his former political associates, and the severance was final when in January 1870 he accepted Napoleon's invitation to form a ministry. It was this ministry which declared war with Germany in July 1870, and was overthrown with disgrace in August 1870. Afterward Ollivier was several times a candidate for election to the Chamber of Deputies, but without success. He was elected a member of the French Academy; and his home became the resort of literary and musical Paris, for his wife was the daughter of Franz Liszt. Beyond that he took no part in politics, but devoted himself to writing works on legal and other subjects. These include 'Lamartine' (1874); 'Principes et Conduite' (1875); 'L'Eglise et l'Etat au Concile du Vatican' (1879); 'Thiers à l'Académie et dans l'Histoire' (1879); 'Le Concordat, est-il respecté' (1883); 'Nouveau Manuel de Droit Ecclésiastique Français' (1885); 'Michel-Ange' (1892); 'L'Empire Libéral' (6 vols., 1894-1908), a defense of his career; 'Solutions Politiques et Sociales' (1894), and 'Marie-Madeleine, Récits de Jeunesse' (1896). In 1870 he was elected a member of the French Academy.

OLMEDILLA, òl-mā-dél'yā, **Ramon Francisco de la Cruz Cano**, Spanish dramatist and poet: b. Madrid, 28 March 1731; d. Madrid, 4 Nov. 1795. He ranks high among the original dramatists of Spain, and he is undoubtedly the best of them in his century. He began by modeling his plays upon strictly classical lines for which he professed an ardent admiration, and remodeled or translated plays from French and Italian. During this period of translation and imitation he acquired an intimate knowledge of the theatre and developed his dramatic talent, which he tried out in almost every kind of dramatic work, legitimate drama, tragedy, comedy, serio-comedy, tragic-comedy, comic opera, farce and sainete. This wide field of action gradually drew him more and more from the rigid lines of strict classical drama, and he soon began to find his own particular and peculiar dramatic sphere in the sainete and the zarzuela, two mediums which permitted him to depict scenes from Spanish life of the middle classes. The former is a short, one-act play, with little or no regularly constructed plot, the aim of which is to give a picture from real life. Olmedilla made the sainete witty and familiar, and achieving this he succeeded in making it so popular that it has continued in public favor to the present day with no sign of declining popularity. The sainete is still to be found on the weekly bill of fare of most theatres in Spain where the moving picture has not driven out the acted drama. The value of Olmedilla's work in this line lies in the fact that he created a species of drama peculiarly national and thus helped to free the Spanish stage from the rigid bonds of classical tradition, and to bring it back to naturalness by thus depicting scenes from real life in a truly realistic manner that attracted the sympathy of the general public. His

influence upon Spanish drama was deep and far-reaching. He turned it from regal to democratic subjects and he cut the bonds that had long bound it to certain forms and prescribed fields.

Next to Lope de Vega he is the most prolific genius in Spanish drama; and he has reached out and covered a wider and more varied field than the only dramatist who can claim to dispute dramatic honors with Shakespeare. In his 30 years of active life he produced over 500 plays, many of which are still unpublished. These touch almost every phase of the life of the Spanish people. Olmedilla also gave form and popularity to the zarzuela, or musical comedy, which has become one of the distinctive features of the Spanish stage. Previous to his time the zarzuela had been based on foreign models and had served for the amusement of the wealthy. But Olmedilla faced about and found his characters for it in the life around him just as he had done for the sainete. All this could have but one result, the renaissance of Spanish drama and its development along new and more national lines. He gave to the Spanish drama an easiness, grace and naturalness of dialogue which it had not previously possessed; for he avoided affectation and exaggeration both in form of speech and versification. He was a master scene maker; but one weakness was his frequent inability to link up his scenes into a properly jointed and related story. This was probably partially due to his constant attention to the sainete and the zarzuela, both of which were developed by him along the same irregular lines and subject to the same weaknesses. But what he lacks in this respect he makes up in his brilliant pictures and conversation of the mass of the common people of Madrid. He passes in review street vendors, dwellers in back streets, all the common and uncommon characters of the Spanish capital with their propensity for talking, their immense fund of good humor and their natural wit; and he makes his audience laugh with them. Yet he never prostitutes the stage which he left purer and infinitely more human than he found it, and hence galvanized into that life which brought with it the renaissance of the Spanish stage. He naturally has had many imitators who have helped, consciously or unconsciously, to change the whole course of Spanish drama, by fixing the attention of the dramatist on every class of society from the highest to the lowest and forcing him to find everywhere the real heart of society and to fit it into the frame of human interest. A list of Olmedilla's works would read more like a catalogue than a part of a literary biography; only a few, therefore, of the best-known dramatic productions are given below: Sainetes, 'La Petray la Juana'; 'La moja mojada'; 'Las castañeras picadas'; 'Manolo'; 'El casero burlado'; 'La comediade Maravillas'; 'Los bandos del Avapiés'; 'El Manuelo'; 'Zara'; 'El Rastro por la Manana'; 'El Careo de los majos'; 'Las tertulias de Madrid'; 'El marido sofocado'; 'El fandango de *candil*'; 'El hambriento en Nochebuena'; 'la visita de duelo'; 'Los payos en el ensayo'; 'Los hombres solos,' and 'Caldereros y vecindad.' Consult Cotarelo y Mori, 'Ranion de la Cruz y sus abras' (Madrid 1899); 'Pérez Galdós, 'Ramon de la Cruz y su epoca' (*Revista de España*, 1870-71).

OLMEDO, José Joaquín, hō-sā' hō-ä-kën òl-mā'thō, Ecuadorian poet: b. Guayaquil, Ecuador, 20 May 1781; d. there, 19 Feb. 1847. He was educated in Quito and Lima, taught law for a time in the University of Lima and then practised in his native city. He engaged actively in public affairs, was vice-president of Ecuador and governor of the department of Guayas, and in 1845 led a successful revolution against General Flores, but though he directed the provisional government he was defeated for the presidency. But his fame as a poet will outlast his political record, and few poets have been more widely read in South America than he. One of his best poems is 'La Victoriade Junin,' a song to Bolívar (1826). His 'Collected Works' (Valparaíso, 1848; Paris 1853, and Mexico 1862) have been widely circulated. See LA VICTORIA DE JUNIN. Consult Gutiérrez, J. M., 'América Poética' (Valparaíso 1846); 'Poesías inéditas de Olmedo' (1861); Herrera, Pablo, 'Apuntes biográficos de D. J. J. Olmedo' (1887).

OLMSTEAD (öm'stēd or ūm'stēd) **CLAIM, The**, in American history, a celebrated case in admiralty law. Originally it was a case of capture on the high seas, and involved questions of prerogative regarding which the decisions of the Federal commissioners were set at naught by a State Court of Admiralty. One Olmstead and others, of Connecticut, being pressed into British service aboard the sloop *Active* in 1777, took possession of the sloop, and were in turn captured by Houston, commanding the Pennsylvania armed brier *Convention*. The Pennsylvania State Court of Admiralty awarded a large share of prize money to the State and to the officers and crew of the *Convention* and the owners, officers and crew of a privateer which assisted in the capture. Olmstead and others appealed to the Federal commissioners of appeals and received a favorable verdict. This the Pennsylvania State Court set aside and deposited the moneys with David Rittenhouse, State treasurer. His executrixes were sued in 1802 before the newly organized United States Supreme Court and judgment was executed in favor of Olmstead and others, in 1809, against violent opposition from Pennsylvania.

OLMSTED, öm'stēd or ūm'stēd, Charles Sanford, American Protestant Episcopal bishop: b. Olmstedville, N. Y., 8 Feb. 1853; d. Old Saybrook, Conn., 21 Oct. 1918. He was educated at Saint Stephen's College, Annandale, N. Y., and the General Theological Seminary, New York, and was ordained priest in 1877. He was subsequently rector of Saint Asaph's Church, Balā, Pa., and in May 1902 was consecrated bishop of Colorado. He published 'December Musings,' verse (1898); 'The Discipline of Perfection' (1902).

OLMSTED, Charles Tyler, American Protestant Episcopal bishop: b. Cohoes, N. Y., 28 April 1842. He was graduated from Trinity College, Hartford, Conn., in 1865, and after studying for the ministry at Saint Stephen's College, Annandale, N. Y., took orders; was assistant in Trinity Parish, New York, 1868-84; rector of Grace Church, Utica, N. Y., 1884-99, and vicar of Saint Agnes Chapel, New York, 1899-1902. In October of the year last named he was consecrated bishop-coadjutor of the

diocese of central New York and in 1904 became bishop. He died 26 March 1924.

OLMSTED, Denison, American physicist and astronomer: b. East Hartford, Conn., 18 June 1791; d. New Haven, Conn., 13 May 1869. He was graduated at Yale in 1813 and later began the study of theology there, but in 1817 became professor of chemistry, mineralogy and geology at the University of North Carolina. He made a geological survey of North Carolina, the first State survey in the United States, publishing reports of the work in 1824-25. He was appointed professor of mathematics and natural philosophy at Yale in 1825, but from 1836, at his request, occupied only the chair of natural philosophy, which he held until his death. He, and his associate, Elias Loomis, were the first Americans to observe Halley's comet in 1835. He was notable for his theory of hailstones and his observations of the aurora borealis. He was a contributor to scientific reviews and author of textbooks, of which more than 200,000 copies were sold. Among them are 'Introduction to Natural Philosophy' (2 vols., 1831); 'Compendium of Astronomy' (1841); 'Rudiments of Natural Philosophy and Astronomy' (1844), etc.

OLMSTED, Frederick Law, American landscape architect: b. Hartford, Conn., 26 April 1822; d. Waverly, Mass., 28 Aug. 1903. He had some early instruction (1837-40) in civil engineering, went to sea, after a year before the mast studied agricultural science and engineering at Yale, and later was for seven years a farmer and horticulturist upon his own land. In 1850 he made a tour, largely on foot, of Great Britain and parts of the Continent, for the study of methods of agriculture and landscape gardening. In 1852-53, 1853-54 and 1856 he traveled in the South and Southwest, investigating the effects of slavery upon the economic and social condition of slave States. The results of his observations appeared in three successive volumes, 'A Journey in the Seaboard Slave States' (1856); 'A Journey in Texas' (1857); and 'A Journey in the Back Country' (1861). In 1861 a compiled work, based upon the three preceding, appeared in London as 'The Cotton Kingdom,' an account, says H. T. Tuckerman, "copious, specific and authentic," which, it is stated, was frequently quoted by such leaders of English opinion as favored the Northern viewpoint in the Civil War. In 1856 he again visited Europe, giving particular attention to parks; and three other trips were subsequently made. In 1855 the State legislature of New York passed an act for the construction of a large central park in New York city and in 1857 Olmsted was made superintendent of the preparatory work. With Calvert Vaux (q.v.) he presented a plan for the park which was selected for the prize from 33 plans submitted in competition. Olmsted then became architect-in-chief, with Vaux as assistant, and despite political difficulties in four years practically completed the task. He employed at one time a working force of nearly 4,000 with a high degree of efficiency. In 1861 he was appointed by Lincoln to the United States Sanitary Commission, of which he became secretary and general manager. He displayed in this post great administrative ability. Besides conducting a necessarily large correspondence, he obtained legis-

lation, visited the field and prepared reports. He aided in the formation of the Union League Club and was prominent in the organization of the Southern Famine Relief Association. In 1863 he resigned from the commission and became first commissioner of the Yosemite National Park and the Mariposa Grove. He was in partnership with Vaux and Withers at New York in the practice of landscape architecture in 1865-72, was for a time president and treasurer of the New York Park Commission, and later for about six years was landscape architect to the commission. In 1878 he removed to Boston and there continued his professional practice. This was very large, and in the pursuit of it he visited every State in the Union and eight times crossed the Continent. In 1895 he retired. A list of the public and semi-public grounds formed wholly or largely after his plans would be very extensive. It has been estimated that among the expressions of his art are more than 80 public parks, including prominently, besides Central Park, the Mount Morris, Riverside and Morningside parks of New York; the Prospect and Washington parks of Brooklyn; the Washington and Jackson parks of Chicago; the Back Bay Fens of Boston, one of the most interesting domains of the kind in America; also in Boston, Leverett, Jamaica, Franklin and Marine parks; Belle Isle Park of Detroit; the Cherokee, Shawnee and Iroquois parks of Louisville; Delaware, South and Cazenovia parks of Buffalo; Lake, West Side and River parks of Milwaukee; and Washington Square in Baltimore. He laid out the grounds for the World's Columbian Exposition at Chicago in 1893, whose landscape features were so remarkable a success. He designed the general scheme for the preservation of the natural scenery at Niagara Falls. He planned the grounds of the capitol at Washington, besides the marble terrace and the grand staircase and other structures exterior to the building. Among his further works are designs for the grounds of numerous suburban land divisions, railway stations, schools, colleges and private estates. It is somewhat difficult to express in concise form Olmsted's distinctive service to the landscape gardening of America. But it may perhaps be defined as having been the originating of the use of natural landscape resources, existing under urban or partially urban conditions toward the making of pleasure-grounds. He studied the genius of American scenery, and in the adaptation of his methods thereto made a real if unobtrusive contribution to the art of the United States. In his public parks he avoided the formal and the monumental as he had seen it in Italy and France and combined system with wild nature in an unconventional result which is distinctive. It has been said that one of the secrets of his success was that he never endeavored to make unsuitable conditions conform to preconceived ideas, but made logical use of such conditions as they were. At the time of his death it was asserted with pardonable exaggeration, if exaggeration it were, that he had done more than any other of his generation to develop the aesthetic possibilities of the country. He was a founder of the Metropolitan Museum of Art, of the American Museum of Natural History and of the New York State Charities Aid Association, of which for many years he was vice-president. In addition

to the books above cited he wrote 'Walks and Talks of an American Farmer in England' (1852), frequently reprinted, and papers and reports on special problems of his profession. For an account of Olmsted's work on the sanitary commission, consult Stillé's 'History' (1866), also *Century Magazine*, October 1893.

OLMSTED, Frederick Law, landscape architect: b. Staten Island, N. Y., 24 July 1870; he was graduated at Harvard 1894. He studied landscape architecture under his father and began practice as landscape architect in 1895. Landscape architect for Metropolitan Park Commission of Boston since 1898; Baltimore Park Commission since 1902; Roland Park Company, Baltimore, since 1898; Sage Foundation Homes Company, Forest Hills, Long Island, N. Y., since 1908; and for various other land companies and for many private properties. Member of Commission on Improvement of Washington, 1902; instructor in landscape architecture, 1901-03; professor, 1903-15; lecturer, 1915—, Harvard University. Member of National Commission of Fine Arts since 1910; member of the Board of Supervising Architects of the Group Plan, Cleveland, Ohio, since 1912; chairman Planning Board of Town of Brookline since 1914; chairman of the executive committee, National Conference on City Planning, since 1910. He has acted in a consulting capacity for and designed portions of the parks or other public improvements of many towns and cities and numerous institutions, land subdivisions and private properties. He is author of numerous reports and articles on parks, municipal improvements, city planning and landscape architecture, and of the following city plan reports: Boulder, Colo.; Baltimore, Md. (both alone and jointly with A. W. Brunner and J. M. Carrère); Detroit, Mich.; Holyoke, Mass.; New Haven, Conn. (jointly with Cass Gilbert); Pawtucket, R. I.; Pittsburgh, Pa.; Rochester, N. Y. (jointly with A. W. Brunner); Utica, N. Y.; Woonsocket, R. I.; York, Pa.

OLMSTED, John Charles, landscape architect: b. Geneva, Switzerland, 14 Sept. 1852; d. 24 Feb. 1920. He was graduated Ph.B. at Yale 1875 and studied landscape architecture under Frederick Law Olmsted. With partners designed parks in Essex County, N. J., Cambridge, Mass., New Orleans, La., Fall River, Mass., Hartford, Conn., Chicago (South parks), Newburgh, N. Y., Newport, R. I., Watertown, Buffalo, Rochester, N. Y., Seattle, Spokane, Wash., and other cities; formed partnership with Frederick Law Olmsted, Jr. (q.v.) in 1898; also designed many private places and grounds of Chicago Exposition, 1893, etc.

OLMŮTZ, ol'mŭts, Czechoslovakia, the second city of Moravia, 38 miles northeast of Brunn, on the March, which almost encircles it. Since 1886 the defensive works have given place to promenades and pleasure-grounds. It has a fine Gothic cathedral erected in 1306; one or two other interesting churches; a remarkably fine townhouse, the ancient residence of the archbishops and several good modern educational buildings. Its industries and trade are unimportant. Olmütz is the see of an archbishop, and the seat of several courts and public offices. It formerly possessed a university, but this is now abolished except the theological

FREDERICK LAW OLMSTED

faculty, connected with which is an extensive library. Olmütz was taken by the Swedes, under Torstensson, in 1642, in the Thirty Years' War. Frederick the Great besieged it for seven weeks in 1758 without success. The Conference of Olmütz was here February 1850, between Russia and Austria respecting the affairs of Germany and especially in reference to the revolts in Hesse and Schleswig-Holstein against their rulers, the Elector of Hesse and the king of Denmark. By the mediation of Russia, Schleswig-Holstein was given to Denmark, and the Elector of Hesse was reinstated. The city possesses excellent schools, including two higher gymnasia, a realschule, a government commercial school and three training schools for teachers. It has several breweries and among its industries are the manufacture of tin, wire, hardware, chemicals, leather, chocolate, sugar and flour. It also has a considerable commerce in agricultural products and machinery.

OLNEY, ðl'nī, Jesse, American geographer and educator: b. Union, Conn., 12 Oct. 1798; d. Stratford, Conn., 31 July 1872. In 1828 he published 'A Geography and Atlas,' which was a standard work for 30 years, and effected a revolution in the methods of teaching geography. He taught school in New York State and Hartford, Conn., sat in the Connecticut legislature for 10 terms and in 1867 became State comptroller. He published 'The National Preceptor' (1831); a series of textbooks (1831-52), including a series of 'Readers,' a 'Common School Arithmetic,' a 'History of the United States,' and a volume of poems, 'Psalms of Life.'

OLNEY, Richard, American lawyer and statesman; b. Oxford, Mass., 15 Sept. 1835; d. 9 April 1917. He was graduated from Brown University in 1856 and from the Harvard Law School in 1858. In 1859 he was admitted to the bar and practised law in Boston, being particularly successful as the chief counsel for the Boston and Maine and other railroads. In 1874 he was elected on the Democratic ticket to the Massachusetts legislature, but was not especially active in politics. In 1893 he was appointed Attorney-General by President Cleveland, and was instrumental in breaking the railroad strike of 1894, by obtaining an injunction against the strikers from the United States Circuit Court of Illinois, enjoining them from interfering with interstate commerce and the United States mails. This injunction was enforced by the use of national troops, and was sustained by a decision of the Supreme Court, it being the first case of "government by injunction" (q.v.) in case of a strike. In 1895 he became Secretary of State, in which position he had charge of negotiations with England in regard to the boundary dispute with Venezuela; and wrote a remarkable official note, sustaining the right of the United States to interfere and giving a wide interpretation to the Monroe Doctrine (q.v.). In 1896 he withdrew from the Democratic party on account of the free silver plank in the platform, but in 1900 he supported Mr. Bryan, publicly declaring his reason for so doing to be because he could not support the Republican policy in regard to the tariff, trusts and imperialism. In 1903 he was prominently

mentioned as Democratic Presidential candidate in 1904. In 1906 he was leader of the policy-holders' fight against the New York and Mutual life insurance companies. In 1913 he declined appointment by President Wilson as Ambassador to Great Britain.

OLNEY, Ill., city, county-seat of Richmond County, on the Illinois Central, the Baltimore, Ohio and Southwestern and the Cincinnati, Hamilton and Dayton railroads, about 115 miles east of Saint Louis. It was settled in 1843. It is an agricultural region and the chief manufactures are flour, brick, tile and dairy products. It has a large trade in its manufactures, and in hay, seeds and fruits. It has a sanatorium and a free public library. The government is vested in a mayor, who holds office two years, and a council. Pop. (1920) 4,491.

OLONETZ, ò-lò-něts, Russia, a northern government bounded north and east by Archangel, southeast by Vologda, south by Novgorod, southwest by Saint Petersburg and Lake Ladoga, and west by Finland; area, about 50,000 square miles. The administrative headquarters is Petrozavodsk. The surface of this government is generally flat; although in the northwest some hills occur, while part of the south is traversed by the ridge which forms the water-shed between the basins of the Baltic and the Volga. The most marked natural feature is the large number of lakes, streams and morasses. The number of lakes—one of them, Onega, nearly 5,000 square miles in superficial extent—has been calculated at 1,500. The climate is rigorous. The winter is long, the summer heat, though of short duration, great. Timber constitutes an important part of the wealth of the government; porphyry and marble are extensively quarried between lakes Ladoga and Onega; iron-ores and copper are worked; and hemp and flax thrive in many of the swampy districts. The chief means of support of the inhabitants are forestry, hunting and fishing. The principal manufacture is that of leather. Pop. about 460,000.

OLUSTEE, ò-lūs'tē, or OCEAN POND, Battle of, the most sanguinary battle of the Civil War in point of numbers. On 5 Feb. 1864 General Gillmore, commanding Department of the South, ordered General Seymour to embark about 6,000 men in transports at Hilton Head and sail for Jacksonville, Fla. The transports were accompanied by five gunboats under command of Admiral Dahlgren. The objects of the expedition were to procure an outlet for cotton and lumber; to cut off one of the enemy's sources of commissary supplies, beef cattle; to obtain recruits for colored regiments; and to inaugurate measures for the speedy restoration of Florida to her allegiance to the Union. To assist in the latter John Hay, President Lincoln's private secretary, was given a military commission and accompanied the expedition. Seymour arrived at Jacksonville on the 7th, dispersed a small guard and occupied the place. On the afternoon of the 8th Col. Guy V. Henry, with cavalry and mounted infantry, moved out some eight miles, and late in the evening surprised about 350 cavalry, under Lieutenant-Colonel McCormick, at Camp Pinegan. Henry charged them, capturing four guns,

with caissons. He reached Baldwin, 20 miles from Jacksonville, on the 9th, where he captured another gun and a considerable quantity of cotton. Baldwin was at the junction of two railroads from Jacksonville and Fernandina. On the 10th Henry advanced to Little Saint Mary's and encountered Major Harrison, with two companies of cavalry, and drove him with slight loss on either side, and then marched to within three miles of Lake City, where on the 11th he had a skirmish with the Confederates, and under Seymour's order fell back to Barber's at the South Fork of the Saint Mary's where Seymour concentrated his entire command, and where he had received orders from Gillmore not to risk a repulse in advancing on Lake City, but to hold Sanderson's, unless there were reasons for falling back. Seymour was delayed for want of transportation, but on the morning of 20 February left his camp at Barber's with the intention of advancing on Lake City and, if successful, of destroying the railroad communication between east and west Florida at the Suwanee River. He had the mounted brigade of Colonel Henry, the three infantry brigades of Cols. J. R. Hawley, W. B. Barton and James Montgomery, and three batteries of artillery, in all about 5,500 men and 16 guns. When Seymour landed at Jacksonville, Gen. Joseph Finegan, the Confederate commander in east Florida, had an insignificant force to oppose him, but by the 13th had collected, at Lake City, about 4,600 infantry, 600 cavalry and three batteries of 12 guns. Col. C. Smith commanded the cavalry, and Gen. A. H. Colquitt and Col. G. P. Harrison the two infantry brigades. Thirteen miles east of Lake City Finegan threw up defensive works, a short distance east of Olustee station, crossing the railroad, the left near Ocean Pond, the right near a bay or jungle. Smith's cavalry, supported by two regiments of infantry, was sent to the front to skirmish with Seymour's advance and draw it on to the entrenched line. Colonel Henry, with his mounted force, the 7th Connecticut Infantry and Elder's battery, led Seymour's advance, and after a march of 15 miles, about 3 P.M. came upon Smith's pickets. Two companies of the 7th Connecticut, of Hawley's brigade, were deployed as skirmishers, and drove them back upon their supports, which opened fire, Elder's battery was pushed forward and opened fire, the rest of the 7th Connecticut was deployed and developed the Confederate position, and Henry's cavalry was disposed on the flanks. The ground was favorable for the movement of troops. It was level and, although covered with pine timber, was free from underbrush. Colquitt, with three regiments of his brigade, had been sent forward to support Smith and take command at the front, and had quickly formed line with his infantry, sending the cavalry to the left. This was the line that the 7th Connecticut developed, upon which Seymour massed his artillery in the centre, and sent the 7th New Hampshire to turn the Confederate left, but the regiment got confused in its movement and, coming under a heavy and deadly fire, broke in disorder and was with difficulty rallied to take part in the action at a later hour. The 8th United States Colored Infantry became hotly engaged on the left, its commanding officer was mortally wounded, and more than half its men had fallen, when the remainder

retreated in disorder. Colquitt's men advanced and delivered a very close and telling fire upon the artillery, shooting down men and horses, but were checked by the unrelenting fire of the guns and by Barton's and Montgomery's brigades, now brought up, and under whose fire the left of the Confederate line began to fall back. Meanwhile Finegan had sent everything to reinforce Colquitt, and on both sides the entire forces, except the cavalry, were desperately engaged, the struggle continuing until dusk, when Seymour withdrew, abandoning his dead and many wounded, and five guns, whose horses had been shot. He was pursued about two miles that day, and withdrew in good order to Sanderson's and thence to the Saint Mary's and Jacksonville. The Union loss was 203 killed, 1,152 wounded and 506 missing. The Confederate loss was 93 killed, 847 wounded and 6 missing. Consult 'Official Records' (Vol. XXXV); The Century Company's 'Battles and Leaders of the Civil War' (Vol. IV).

E. A. CARMAN.

OLYMPIA, ō-lím'pī-ā, a sanctuary of the Greek gods and a valley or plain lying in the middle of ancient Elis, in the western part of the Peloponnesus (Morea). It was also the scene of the Olympic games. Here were collected thousands of statues of the gods and of victors in the games, treasure-houses full of votive offerings, temples, altars, tombs and in a word the most precious treasures of Grecian art. The elder Pliny states that in his time the statues were as many as 3,000 in number. Here also were preserved important public and private documents, treatises and inscriptions of all kinds. The Altis (an old Elean form of "alsos," a grove), in which were situated the Olympiæum or great temple of Zeus, containing the colossal statue of the god by Phidias; the Heraeum or temple of Hera, the Metroön or temple of the mother of the gods, the treasuries of the different states which had sent votive offerings to the Olympian Zeus, the Prytaneum, in which the Olympic victors dined after the contests were finished, the Bouleuterion, in which all the regulations regarding the games were made, and other buildings and sacred objects, formed a quadrangle surrounded with walls, and having a length of about 1,800 feet and a breadth of 1,500. There also was the Exedra, a splendid building containing the reservoir of an aqueduct, erected by the Athenian orator and statesman, Herodes Atticus, and furnished by him with statues of the families of the emperors Antoninus Pius and Marcus Aurelius, and by the Eleans, out of gratitude to the builder, with statues of the family of Atticus himself. On the north it was bordered by rocky but gently swelling hills, the most southern of which was called Mount Cronius, or the Hill of Kronos. On the south it extended almost to the river Alphæus, and on the west it stretched to the Cladeus, a tributary of the former. Outside the walls, but in the immediate neighborhood of the Altis, were the hippodrome, or race-course for chariots and for single horses; the stadium or foot-race course; a theatre and a gymnasium. After being buried for ages under the soil washed down from the higher grounds, and conveyed by the inundations of the two streams between which it lies,

the plain of Olympia was again brought to view by a series of excavations begun in 1875 by the German government at the instigation of Ernst Curtius, and continued till the spring of 1881. Nearly all the buildings above mentioned were rediscovered, but unfortunately all in a much injured condition. Thousands of fragments of sculpture, bronzes, coins, terracottas, as well as numerous coins and inscriptions, were also among the discoveries. The originals all remained in the possession of Greece, but Germany bargained for the right to take the first casts from them, and a museum of Olympian casts and duplicates was formed at Berlin.

The excavations of Curtius cover practically all of Olympia, which was in no sense a town or even a village. It was simply one vast shrine covered with sacred edifices and buildings connected with them and the Olympic games. They show that the central part of the great enclosure was occupied by the great altar of Zeus, upon which were offered up the burnt sacrifices. This is a great block of undressed, unmounted stone, which stood in the open without covering or protection of any kind. When it was unearthed several layers of ashes of its victims were still lying upon it. It stood to the northeast of the great temple of Zeus, the ground plan of which was still complete when excavated, and around it were lying most of the columns just as they had lain when they were first overthrown by an earthquake before they were finally buried by débris carried into the valley by floods years after the erection of the building was begun by its architect, Libon of Elis, in the 6th century B.C. The excavations show that the description of it left by Pausanias is correct. It has a single row of 13 Doric columns at each side and six at each end. Many interesting and historically valuable remains of this temple have been recovered, some of them practically unimpaired; and this wealth of material from Greece's greatest temple shows why it was that it took until the middle of the 5th century B.C. to complete its construction. Among the material recovered from the ruins of the temple are statues that have become a part of the history of Greece and many inscriptions of great historic interest. Among the excavations is also the temple of Hera, about 100 metres north of that of Zeus, which it resembled in form, though it was only about two-thirds as large. It had 16 columns at each side, which were partly of wood and partly of stone, showing that they had all been originally of wood and that some of them had been replaced from time to time by stone columns. This is interesting as showing the history of the Doric columns, which were originally imitations of the forest trees under which the Greek altars were placed in primitive times. The temple of Hera was, therefore, evidently older than that of Zeus. In the ruins of the temple of Hera the famous statue of Hermes by Praxiteles was found and placed in the Museum of Olympia. One of the interesting parts of the excavations is the long line of 12 treasury buildings, which stretched eastward from close to the temple of Hera, and were erected, each by one of the Greek states in the form of small temples. In them were stored the equipment for the games and the offerings of the states. The ground plans and some remains of practi-

cally all the historical buildings of Olympia have been unearthed. Among these are two gymnasiums, the Metroön, or temple of the Mother of the Gods, and the Bouleuterion, or senate-house, an oblong hall of the 6th century, paralleled by a similar hall built at a later date, both of which are connected by a square building. To these must be added the Stadium, the Hippodrome and the Leonidæum.

OLYMPIA, Wash., city, capital of the State of Washington, county seat of Thurston County, on Budd's Inlet at the mouth of Deschutes River and on the Northern Pacific and Union Pacific systems. The Inlet is at the head of Puget Sound (and the city has steamer communication with Tacoma, Seattle, Victoria and other places on the Sound and on the Pacific Coast). It was settled in 1846 and chartered as a town in 1859, and as a city in 1890. Olympia has a Port Commission and the completion of the port of Olympia under the proposed plan will give the city superior water front and harbor facilities. Large quantities of oysters are shipped from Olympia and the water power derived from the several falls of the Deschutes River contributes toward making it a manufacturing city. The chief manufacturing establishments are lumber mills, veneer plants, knitting mills, fruit and vegetable canneries. It has an extensive trade in lumber and lumber products and in farm products, fruits and its own manufactures. The city is beautifully situated on gently rising wooded slopes. The principal buildings are the new State Capitol and the five office buildings in the group. Thirty-five acres of land constitute the grounds. Other principal buildings are the county court house, two modern bank buildings, public library, Federal building, Saint Peter's Hospital (Roman Catholic), High School and grade school buildings. Beside the City Public Library, it has the State Library, containing nearly 35,000 volumes, State Traveling Library, with over 40,000 volumes, and State Law Library. Pop. 8,537.

OLYMPIAD, in ancient Greece, the computation of time based on the period of four years between each celebration of the Olympic games (q.v.). The historian Timæus is said to have been the first to adopt this mode of reckoning time, and later Greek historians almost all followed his example. In reckoning by this era the year in which Coræbus gained the victory in the foot-race, corresponding to 776 B.C. of the Christian era, was taken as the first year of the first Olympiad. This mode of reckoning ceased when the games were abolished in 394 A.D., the second year of the 293d Olympiad. The interval between two Olympiads was four of our years, or a Greek *pentaeteris* of 48 moons and two intercalary months. To reduce from the Olympic to the Christian era, multiply the next number below the given Olympiad by four and add the number of the year in the given Olympiad, if the sum is 776 or less, subtract it from 777, and the remainder is the year B.C.; if it is greater than 776 subtract that number from it and the remainder is the year A.D.

OLYMPIAS, first wife of Philip II of Macedon and mother of Alexander the Great: d. 316 B.C. She was married to Philip in 359 but was put away by him so that he might marry Cleopatra, a niece of King Attalus, in 337. Olympias may have been cognizant of the

plot against Philip's life which resulted in his death in 336. She played a considerable part in politics during Alexander's rule. About 319 she regained a part in the government and was largely instrumental in the death of Cleopatra and her infant son in 323. In 317 she joined forces with the new regent, Polysperchon. They together invaded Macedonia and defeated Arrhidæus, the successor of Alexander and put him and his wife Eurydice to death. Established in power, she continued to wreak her vengeance on all those who had been opposed to her, and ordered the execution of several Macedonian nobles including Nicanor the brother of Cassander (q.v.). Cassander thereupon at the head of an expedition from the Peloponnesus compelled her to seek refuge in Pydna during the winter. The siege ended with her surrender of the city and her immediate execution in the spring of 316 B.C.

OLYMPIC GAMES, in ancient Greece, a general name given one of the four great national festivals. The games were usually celebrated on the plain of Olympia and were sacred to the Olympian Zeus, who had a temple and statue there. The festival was a quadrennial one; the period elapsing between two celebrations was called an Olympiad. Their origin reaches back into a remote antiquity, prior to the commencement of the historical era in Greece and by the Greeks themselves was attributed in various traditions to a divine source. The season of the year at which the games were held was about midsummer. In later times, when the contests were numerous, they lasted five days and the fourth day of the festival was the day on which the first full moon after midsummer fell and, therefore, according to the Greek mode of dividing the year, the 14th day of the month. The games thus lasted from the 11th to the 15th, inclusive. The number of the judges varied at different times, but ultimately was fixed at eight. Their decision was not final, but might be revised by the senate. Under the judges was a set of police called Alytæ, who kept order during the celebration of the games. None but Greeks of pure descent were allowed at any time to take part in the games, until the conquest of Greece by the Romans, when they also were admitted to the contests. If, however, a man could boast of pure Hellenic blood, it did not matter to what city he belonged or whether he was rich or poor, he had in any case an equal right to be recognized as a competitor, provided he complied with the regulations of the judges. Barbarians were permitted to be spectators of the games. Women were entirely excluded and were not even allowed to cross the Alpheus while the games were going on. For the first 13 Olympiads there was only one contest, a foot-race. In course of time the number of contests increased to 24, including shorter and longer foot-races, wrestling, boxing, chariot-racing, horse-racing, foot-racing in heavy armor, chariot-racing with mules and games for boys corresponding to most of those in which men engaged. The prize awarded to the victor was merely a garland of wild olive, but the honor of gaining such a prize was so highly esteemed that a victor in the Olympic games was regarded as bringing glory not only to himself but to his family and even the city or state

to which he belonged. The victor received his crown standing on a table made of ivory and gold. His own name and that of his father and his native state were proclaimed by a herald to the assembled multitudes. The celebration was concluded by religious ceremonies and processions and by banquets in honor of the victors. On returning to his native city the victor was honored with a triumphal procession and heard his praises celebrated in lyric verse, which was sometimes the production of the greatest poets of the time. In addition to this, special privileges were usually conferred on them for life. A place of honor was allowed them in all public assemblies, statues were erected to them and so forth. At Athens they were maintained for the rest of their life at the public cost.

The ancient Olympic games died out during the 4th century A.D. and were not revived until 1896, when the first of a new series, the "Modern Olympic Games," were played in Athens in a stadium especially built for the purpose. Great interest has been manifested in this revival and contestants from all the principal countries enter the lists at each Olympiad or four-year period. Many features of the ancient procedure are kept intact, as far as possible, but with modern modifications and additions.

The best records in the principal events, previous to 1911, were as follows:

- 100-Meter Run — Jarvis (America), 10 4-5s., Paris, 1900; Walker (So. Africa), 10 4-5s., London, 1908.
- 200-Meter Run — Hahn (America), 21 3-5s., Saint Louis, 1904; Tewksbury (America), 22 1-5s., Paris, 1900; Kerr (Canada), 22 2-5s., London, 1908.
- 400-Meter Run — Hillman (America), 49 1-5s., Saint Louis, 1904; Long (America), 49 2-5s., Paris, 1900.
- 800-Meter Run — Lightbody (America), 1m. 56s., Saint Louis, 1904; Sheppard (America), 1m 52 1-5s., London, 1908.
- 1500-Meter Run — Sheppard (America), 4m. 3 2-5s., London, 1908; Lightbody (America), 4m. 5 2-5s., Saint Louis, 1904; Bennett (England), 4m. 6s., Paris, 1900.
- 110-Meter Hurdles — Smithson (America), 15s., London, 1908.
- 200-Meter Hurdles — Hillman (America), 25 3-5s., Saint Louis, 1904.
- 400-Meter Hurdles — Hillman (America), 53s., Saint Louis, 1904; Bacon (America), 55s., London, 1908.
- Running High Jump — Porter (America), 6 ft. 3 in., London, 1908; Baxter (America), 6 ft. 2 4-5 in., Paris, 1900.
- Running Long Jump — Irons (America), 24 ft. 6 1-2 in., London, 1908.
- Running Triple Jump — Ahearne (England), 48 ft. 11 1-4 in., London, 1908.
- Standing Broad Jump — Ewry (America), 11 ft. 4 7-8 in., Saint Louis, 1904, and 10 ft. 11 1-4 in., London, 1906.
- Standing High Jump — Ewry (America), 5 ft. 5 in., Paris, 1900.
- Pole Vault — Gilbert and Cook (America), 12 ft. 2 in., London, 1908.
- Shot Put — Rose (America), 48 ft. 7 in., Saint Louis, 1904, and 46 ft. 7 1-2 in., London, 1908; Sheldon (America), 46 ft. 3 1-8 in., Paris, 1900.
- Discus — Sheridan (America), 136 ft. 1-3 in., Athens, 1906, and 134 ft. 2 in., London, 1908.
- Throwing 16-lb. Hammer — Flanagan (America), 170 ft. 4 1-4 in., London, 1908.
- Marathon Race — Sherring (Canada), 2h. 51m. 23 3-5s., Athens, 1906; Hayes (America), 2h. 55m. 18s., London, 1908; S. Louis (Greece), 2h. 55m. 20s., Paris, 1896.
- Pentathlon — Mellander (Sweden), 24 points, Athens, 1906.

The 1911 meet was held in July 1912, at Stockholm, Sweden, and was most successful. The scores of the American athletes (85 points) were far in the lead and nearly as great as those of all other nations combined.

The European War, 1914-18, interfered with the arrangements for the 1916 meet which was to have been held in Berlin. The 1920 meet was held in Belgium. The tables give the results.

*World Record.

OLYMPUS, a mountain situated in Thesaly, at the eastern extremity of the range called the Cambunian Mountains. It is now generally called by the Greeks Elymbos or Olymbos. The Turks call it Semavat-Evi, the abode of the celestials. It rises to the height of 9,794 feet, being the highest mountain in Greece. The earliest Greeks looked upon it as the highest of all mountains and as the central point of the earth's surface. The gods of Homer dwelt on its summit. In after times the gods were said to reside in the exterior sphere of the heavens, above the firmament and this seat of the blessed received the name of Olympus. Hence the gods themselves were called Olympian gods and, as such, formed a body of which Zeus was the head. The 12 great gods composed the council in Olympus and the others the general assembly. They did not dwell together, but separate in several mansions built upon the different heights of the many-peaked Olympus. At the highest summit stood the palace of Zeus, where all assemblies and feasts were held. From thence he could look down upon the earth, fill the heavens with clouds and hurl his thunderbolts. The name Olympus was given to several mountains or chains of mountains, one in northern Mysia, two in the Island of Cyprus and others in Lycia, Lydia, Cilicia, Lesbos, Elis and Laconia.

OLYNTHUS, 5-lin'thus, now **AIS MAMAS**, Saloniki, an ancient town of Chalcidice,

at the head of the Toronaic Gulf, the modern Gulf of Cassandra. It was early inhabited by Greeks, was taken by the Persians under Artabazus, one of the generals of Xerxes, was subject to Athens and regained its independence when the Spartan general Brasidas extinguished the Athenian power in Chalcidice. From its excellent maritime position, it grew in wealth and importance, until, becoming too powerful, the Spartans captured it in 379 B.C. In 352 the Olynthians formed an alliance with the Athenians, which provoked the hostility of Philip of Macedon and in 347 the city was betrayed to him, the citizens were enslaved and every building was demolished.

OLYPHANT, 5-l'i-fänt, **Robert Morrison**, merchant and railroad president: b. New York, 9 Sept. 1824; d. 3 May 1918. He was the youngest son of a prominent New York merchant engaged in the trade with China and interested in Presbyterian mission effort there. He was educated at Troy, N. Y., Middletown, Conn., and in New York City. At 15 he entered Columbia University and graduating in 1842, from 1900 was the oldest living alumnus. After graduation he entered the employment of Talbot, Olyphant and Company, his father's firm, and visited China in 1844, returning a year later. In 1858 Mr. Olyphant reorganized the old firm of Olyphant and Company of China and again visited the Orient, where he remained for four years. He was the active

head of the firm until his retirement from mercantile business in 1873. In May of that year he was elected a member of the board of managers of the Delaware and Hudson Company and its allied interests: the Cooperstown and Charlotte Valley Railroad, the Champlain Transportation Company, the Chateaugay and Lake Placid Railway Company, the Chateaugay Iron and Ore Company and the Lake George Steamboat Company. He afterward served as assistant president, vice-president, and for 20 years as president. In his advanced years he held the position of honorary chairman of the executive committee. Besides the numerous philanthropies of city, State and his church, missionary endeavor in China, notably the Canton Christian College as a Fellow of the National Academy of Design, he was also actively interested in art.

OLYPHANT, ōl'i-fant, Pa., borough in Lackawanna County, on the Lackawanna River and on the New York, Ontario and Western and the Delaware and Hudson and the Wilkes-Barre and Eastern railways, about six miles above Scranton. It was settled in 1857 and incorporated in 1877. It is in the anthracite region and its chief industries are connected with mining and shipping coal. It manufactures blasting powder and has machine-shops and iron works. Its chief trade is in coal. The government is vested in a burgess, who holds office three years, and a council. The borough owns and operates the electric-light plant. Pop. 10,236.

OM, ōm, a Sanskrit word, to which the Hindu religion attaches peculiar sanctity and mystic significance. It is pronounced at the beginning and end of every lesson in the Veda and is also the introductory word of the Puranas. In the Vedas it is said to comprehend all the gods. According to the ('Upanishads,' the word "om" sums up in itself all truth and much of the latter work is taken up with explaining its mystical meaning. If "om" is not repeated at the beginning and end of every Vedic recitation they will prove of no avail or at any rate lose much of their virtue. "Om" symbolizes the union of the three great Hindu divinities, Vishnu, Siva and Brahma. See OM MANI PADME HUM.

OM MANI PADME HUM, ōm mā'nē pād'mē hoom, a sacred formula in the Buddhist religion, known as the "formula of six syllables," used especially in Lamaism. Among the Tibetans and the Mongols it is repeated on all occasions, important and unimportant, and is found written on all sorts of objects on which inscriptions can be made. It is the first thing which a child learns to repeat. When written in the form of a monogram its sacred character is exalted. The formula is explained to mean either, "Oh, the jewel in the lotus: Amen"; or "Salvation in the jewel-lotus: Amen." A Western definition makes it signify: "Oh, the jewel in the lily of purity: Amen." Avalokites vara or Padmapāni, the lotus-handed, the Buddha of eternal light and heavenly ruler of the Western Paradise; the reputed author of the formula is said to have been born from a lotus or water-lily (q.v.). Consult Schlayintiveit, Emil, 'Buddhism in

Thibet' (London 1863); Waddell, L. A., 'The Buddhism of Thibet' (London 1895). See OM.

OMAGUAS, ō-mā'wā, a people of south-eastern Colombia. Their territory is now greatly restricted and the people themselves are much reduced in numbers; but the Omagua language, which belongs to the Tupi-guarani family, is still spoken even outside the limits of the original tribal boundaries. In pre-Colombian times the Omaguas were spread over parts of Colombia, Peru and Brazil. They were accustomed to flatten the heads of their children in early infancy and hence the designation "Omaguas," which means flat-headed people, a name given to them by other more cultured races with whom they came into contact and who transmitted it to the Spanish conquerors. The name Cambena has also the same meaning. At the time of the conquest of Peru and later, reports were current in Peru itself and among the Spanish conquerors generally, of the great wealth and high civilization and the vast extent of territory of the Omaguas, whose chief dominion and capital seem to have been on the east side of the Cordilleras. Common report said that their's was the land of El Dorado (of the golden or gilded man), a place of fabulous wealth in gold and precious stones. Thus the capital of the Omaguas was undoubtedly confounded with that of the famous Chibcha civilization of the upland plateau of Colombia. Three successive expeditions were sent into the Omagua country to effect its conquest in 1536, 1541 and 1560, but the powerful defenders of the land defeated them and drove them back with great loss. From this latter date the Omaguas seem to have been allowed to continue their national life without other organized attempts to conquer them. This would seem to be, in itself, evidence in plenty that they possessed neither great wealth nor populous cities which would certainly have attracted the cupidity of the Spanish adventurers. There is plenty of evidence, however, that they were much more civilized than the Brazilian and other races who surrounded them; that they dressed in woolen garments, and that they possessed a well-organized form of government which held dominion over a very extensive tract of country. The Omaguas seem to have gradually retreated before the march of European civilization and conquest to the upper Amazon Country, where they continued to occupy numerous small villages along the Amazon River and in the interior. There the Catholic missionaries found them in 1645 and continued to maintain Jesuit missions among them until the Jesuits were finally expelled from the country in 1776. The excesses of the slave trade, attacks by Portuguese and later exactions and abuses of rubber gatherers drove the Omaguas into the deep forest where their descendants live to-day. In this retreat they left behind them about half a hundred once prosperous towns and villages. Many of them are to-day rubber gatherers.

OMAHA, ō'ma-hā, a tribe of American Indians of the Dhegiha group of the Siouan family residing in eastern Nebraska. The name is derived from an Indian word meaning "those who go up the stream or against the current." They number about 1,400. This tribe, which

is very closely related to the Kausa and Osage, has wandered considerably during the past 400 years. They originally lived on the Ohio and Wabash rivers about 1500 or earlier, but moved up the Mississippi to the country round the mouth of the Missouri. Then in company with the Ponca, they crossed the Missouri and resided for a while in Iowa, where they are said to have ranged as far as the famous Pipestone Quarry (Pipestone, Minn.). Meeting the hostile Dakota, they were forced to retreat and the Ponca went on to the Black Hills (about 1650), while the Omaha settled on Bow Creek, Nebraska. In 1761 a part at least of the Omaha were living on the east side of the Missouri River above Big Sioux River and beyond the Iowa and they seem to have been on friendly terms with the Dakota and to have occupied, with them, territory on the Minnesota River. In 1802 the tribe was very greatly reduced by smallpox and this induced them to move down the Missouri to the neighborhood of Sioux City, S. D., where they were found by Lewis and Clark in 1804. At this period and later on they were at war with the Sioux. By the treaty of 16 March 1854, the Omaha ceded to the United States all their lands west of the Missouri and south of a line running west from where the Iowa River leaves the bluffs. The territory north of this constituted a reservation. Part of the latter was sold to the United States in 1865 as a reservation for the Winnebago. In 1882 a law was passed granting the Omaha land in severalty. The dwellings of the Omaha were generally made of earth and were similar to those of the Mandan. But they also made use of bark lodges, and when they were on hunting expeditions they carried along with them skin tipis which could be quickly set up on the open plains where other shelter could frequently not be had in the buffalo country. Despite their nomadic habits the Omaha cultivated corn, beans, squashes and probably other vegetables and made provision for winter store. Consult Fletcher, A. C., 'Study of Omaha Music' (Cambridge 1893); 'The Omaha Tribe' (Washington 1911).

OMAHA, Neb., the largest city in the State and county-seat of Douglas County, is situated on a slightly eminence on the west bank of the Missouri River, 600 miles from its confluence with the Mississippi. Although a superficial survey of the city had been made in June 1853 no attempts were made toward a permanent survey. The Indian title had not been extinguished and the Indians were very tenacious of their rights and viewed with suspicion all the movements of the white men.

History.—It was not until March 1854 that a treaty was concluded with the Otoes, Missouris and Omaha Indians, ratified 21 June and promulgated 24 June, whereby the title of the Indians was surrendered and left the land to be taken up and enjoyed by the white men. In the spring of 1854 some settlers arrived and the first building was erected. The first general election in the Territory was held 20 Dec. 1854, and on 16 Jan. 1855 the first legislative assembly was convened at Omaha, and on 24 January commenced a contest (which lasted for 12 years), when the member from Cass County gave notice that, at an early day, he would in-

roduce a bill to locate the capital of Nebraska. The struggle was long and bitter, often at the expense of needed legislation, producing much ill-feeling and was more troublesome to manage than any question the legislature had been called upon to decide. After a long debate upon the proposition of the member from Cass, the question was decided in favor of Omaha by a vote of 14 to 11 in the lower house, only to be renewed at every subsequent meeting of the legislature, until Nebraska became a State, when the capital was removed to Lincoln. On 2 Feb. 1857, by an act of the legislature, Omaha became an incorporated city, it having been up to this time a county organization, and an election was held on the first Monday in March in that year, when a mayor, nine aldermen and other city officers were elected. The council held its first session 6 March. Under the direction of the council the mayor proved up the claim of the city east of the 6th principal meridian and the same was surveyed and laid out into city lots, streets and alleys.

The discovery of gold in Colorado in 1858 made Omaha the best point for outfitting for the mines. The streets were filled with emigrants on the way to the gold fields and daily trains left to cross the plains in search of gold. At the breaking out of the Civil War Omaha was made military headquarters, which greatly increased its business and importance. From the day that President Lincoln decided that the initial point of the Pacific Railroad should be "at a point on the western boundary of Iowa, opposite section 10, township 15, north of range 13, east of the 6th principal meridian in the State of Nebraska," the success of Omaha was assured, and from a city of 320 blocks it has grown to one of 37.9 square miles.

Government.—Omaha was the first of the larger cities to adopt the commission form of government. The city is governed by seven commissioners elected at large, the mayor being chosen from among the seven by the commissioners themselves. The mayor has charge of municipal affairs. In addition there is a building commissioner, a fire and police commissioner, commissioner of streets, commissioner of finance, commissioner of public parks and playgrounds and commissioner of public improvements. Each commissioner receives a salary of \$4,500 annually. By a special act of the legislature, Omaha, South Omaha and Dundee were permitted to consolidate by popular vote. Greater Omaha now combines these two thriving suburbs. Late in 1921 Florence and Benson also were annexed to Omaha as a part of the greater city.

Public Parks.—The chief suburban attractions of the city are its parks, 23 in number, which are connected by a boulevard system of 35 miles. Hanscom Park, the oldest, contains 60 acres. Riverview, in the bluffs overlooking the Missouri, contains 70 acres. Bemis Park contains 10 acres; Elmwood contains 215 acres; Miller Park, 80 acres, and Fontenelle Park, 110 acres. Prospect Hill Cemetery is located in the northwest part of the city on high and eligible ground. Forest Lawn is situated seven miles northwest of business centre of city; others are Mount Hope Cemetery, Jewish Cemetery, Bohemian, Ever-Green, Springwell, Holy Sepulchre, Saint Mary's and Cassidy's Roman Catholic cemeteries.

Buildings.—Among the more pretentious buildings are the Douglas County courthouse, a beautiful building occupying a full block in the heart of the city and recently completed at a cost of \$1,500,000, the Omaha High School building, completed recently at a cost of \$1,250,000, the largest high school building west of Chicago. Other pretentious buildings are the Omaha Bee building, the City National Bank building, Woodmen of the World building, Union Pacific headquarters, First National Bank building, Fontenelle Hotel, *World Herald* building, city hall, the home of all city officers, erected at a cost of \$550,000, and the United States custom-house, post office and courthouse, erected at an expense of \$1,800,000. This building, of the Roman style of architecture, is located in the heart of the city, with an entrance on four streets. The first floor is devoted exclusively to the post office, second to the customs, internal revenue and railway mail service, third to the United States District and Circuit Courts, fourth to the grand and petit juries, weather bureau and civil service departments.

Churches.—Omaha has 170 churches of all denominations. It is the seat of bishoprics of the Roman Catholic and the Protestant Episcopal churches. There are in the city 21 Roman Catholic, 21 Methodist, 20 Presbyterian, 20 Lutheran, 10 Episcopal, 14 Baptist, 6 Congregational, 4 Christian, 6 Jewish, 2 United Brethren, 4 Evangelical, 2 Christian Science churches with many other denominations represented by a single church.

Charities and Hospitals.—These institutions include the Creche, Child Saving Institute, Emanuel Orphan Home, 13 hospitals and the Nebraska Institute for the Deaf. Omaha is very well equipped with hospitals, having accommodations for over 1,300 patients at one time. Saint Joseph's, an endowed Catholic institution, is among the largest hospitals west of the Mississippi.

Finances.—Omaha although 34th city in population is 18th city in the United States in volume of business. It has 10 national banks, capital \$6,950,000; 9 State banks, capital \$935,000 with deposits aggregating, in 1921, \$105,701,034; a Federal Farm Loan Bank; a Federal Reserve Branch Bank and 9 building and loan associations with resources of \$49,758,972. The city's bank clearings, in 1921, totalled \$2,388,586,896. The assessed valuation of real estate is \$320,000,000. The tax levy amounts to .099 mills.

Libraries.—The libraries are those of the New York Life Insurance Company, Law library (2,500 volumes); Omaha public library (98,000 volumes); the library of Young Men's Christian Association; two Catholic libraries at Creighton College, one for the use of the faculty (8,000 volumes, being composed in part of rare and old books and manuscripts of the 15th, 16th and 17th centuries); the other for the use of the students (12,000 volumes). The Masons, Odd Fellows, Swedish, Danish and Bohemian societies all have valuable libraries. In October 1888 G. W. Lininger erected an art gallery in the Italian Renaissance style, at a cost of \$15,000, in which to house his judicious collection of paintings and other works of art. The present collection is valued at over \$300,000 and consists of old oil paintings, modern oil paintings, water colors, statues and

busts, vases and plaques, porcelains, curios and articles of vertu, and the whole is open to view and inspection of the public two days in the week.

Public Schools.—The schools of the city are under the control of a board of education of 12, elected at large. Women paying taxes and those who have children of school age may vote for members of the board. The superintendent is elected by the board.

There are 53 school buildings in the city, 49 graded, two high school buildings and two special buildings. The value of school property is \$4,000,000.

Industries.—There are many and diversified industries in Omaha with meat packing, ore smelting and oil refining in the lead.

The American Smelting and Refining Company commenced business in October 1870 with a capital of \$60,000. In 1882 the Grant Smelting Company was consolidated with the Omaha company. A reorganization was completed with a capital of \$2,500,000. They handle silver, lead, copper ores, from the Western States, Mexico and British possessions. The business of a single fiscal year of this plant was as follows: 331,792,488 tons lead, \$15,760,143; 121,301,418 ounces silver, \$10,650,710; 389,685 ounces gold, \$8,046,788; 21,324,785 pounds copper, \$3,731,837; 7,794,928 pounds blue vitriol, \$516,745. Omaha is in the centre of the great wheat and corn producing portions of Iowa, Nebraska, Kansas and Missouri, and the largest cattle and hog productions of the country are marketed here. For a single year elevators handled 68,000,000 bushels of corn, oats and wheat.

Railroads.—The geographical position makes Omaha a natural railroad centre. Ten great trunk systems, with 22 lines connecting to every part of the United States, enter the city, thus bringing it into communication with all parts of the Union. No Western city has greater railroad facilities. Within the past few years two railway stations have been erected, the Union depot at a cost of \$400,000, and the Burlington costing \$500,000. The Missouri River is spanned at Omaha by two railroad bridges and one motor and wagon bridge. The following are the lines out of Omaha for the East: Chicago, Burlington and Quincy; Chicago, Milwaukee and Saint Paul; Chicago and Northwestern; Chicago, Rock Island and Pacific; Illinois Central; Chicago and Great Western. To the North and Northwest: Chicago and Northwestern; Illinois Central; Saint Paul, Milwaukee and Omaha. West and Southwest; Union Pacific; Chicago, Rock Island and Pacific; Kansas City, Saint Louis and Council Bluffs. South and West: Missouri Pacific; Wabash; Kansas City, Saint Louis and Council Bluffs.

Trade and Commerce.—Over 900 firms, covering every line of mercantile industry known in the United States, are engaged in wholesale and jobbing. The business extends east to the Mississippi River, north to Manitoba, south and southwest to Texas and Mexico, west to the Pacific. Omaha is a port of immediate transportation of foreign goods, which has permitted the merchants to receive merchandise and pay duties at home without the delay on the seaboard. The value of the jobbing business in 1890 was \$47,000,000, and in 1921, \$345,-

OMAHA, NEB.

Douglas County Court House

OMAHA, NEB.

Douglas Street, west from 17th Street

952,025. The value of productions of factories, industry, packing houses and smelters was (in 1890) \$68,000,000; 1921, \$506,700,793. At South Omaha are located the famous packing houses and stockyards, where more than \$30,000,000 have been invested. The daily capacity of killing and preparing for market is 15,000 hogs, 5,000 cattle and 4,000 sheep. The livestock receipts at the stockyards were: 1890—hogs, 1,702,723; cattle, 615,337; sheep, 153,873; horses, 5,007; total, 2,477,002; 1921—hogs, 2,665,276; cattle, 1,434,576; sheep, 2,752,952; horses, 6,779; total, 6,859,583.

Trade Territory.—Omaha serves the most productive agricultural producing territory in the United States. Its trade territory, limited only by its transportation facilities, consists of the State of Nebraska, the west half of Iowa, the northwestern part of Missouri, Montana, Wyoming, part of Colorado, and Kansas. Some Omaha institutions include Utah, Washington and California in their trade. Omaha is the second primary livestock market and packing centre of the world, the fourth primary grain market, the greatest butter-producing city in the world, has the largest smelter of fine ores and lead, is the fourth distributing point for agricultural implements and has the largest macaroni factory in the United States.

Trade Activities.—Omaha receives over 6,750,000 head of livestock on its livestock market annually; more than 65,000,000 bushels of corn, wheat, oats and rye; manufactures 30,000,000 pounds of creamery butter; distributes \$18,000,000 of agricultural implements, \$60,000,000 of groceries, \$22,000,000 of smelter products, \$28,000,000 of oils, \$4,000,000 of poultry and eggs, \$19,000,000 of coal and coke, \$27,000,000 dry-goods and notions, \$9,000,000 hardware, \$87,000,000 automobiles and accessories, annually.

Newspapers.—The first paper published in Omaha was *The Omaha Arrow*, its initial number being dated 28 July 1854. There are published at present the *Morning and Evening World-Herald*; the *Morning and Evening Bee*; the *Omaha Daily News*; the *Omaha Daily Hotel Reporter*; *Omaha Excelsior*; *Mercury*; *Western Laborer*; *Bohemian Voice*; *Commercial Exhibit*; *Omaha Tribune*; *Pokrok Zapadu*; *Svenska Posten*; *Swedish Journal Tribune*; *Young Men's Journal*; *Den Danske Pioneer*; *Westliche Presse*; *Examiner*; *Central Farmer*; *Enterprise*; *Fraternal Union Advocate*; *Nebraska Farmer*; *Protector*; *Quill*; *Royal Woodman and Workers Gazette*.

Population.—(1920) 191,601.

O'MAHONY, ò-mă'ò-nĭ, John Francis, Irish politician; b. Kilbeheny, County Cork, Ireland, 1816; d. New York, 7 Feb. 1877. He was educated at Trinity College, Dublin. Fired with zeal for Ireland's cause he entered the ranks of the Young Irelanders in 1845 and took part in the insurrection of Smith O'Brien in 1848, after which he was compelled to seek refuge in France. In 1854 he came to the United States. He was active in founding the organization of the Fenian Brotherhood, acted as its president for several years, and though personally taking no part in any of the insurrectionary movements in Canada or Ireland his advice was never withheld. He devoted his later years to literature, but endured great pov-

erty. At his death his body was taken to Ireland, where he was buried with honors in Glasnevin Cemetery, near Dublin. He published 'History of Ireland by Geoffrey Keating' (1857), which he translated from the Gaelic and annotated copiously. Consult Webb, Alfred, 'Irish Biography' (Dublin 1888).

OMALIUS D'HALLOY, ó-mă'lĕ-ús dăl-wă, Jean Baptiste Julien, BARON D', Belgian geologist and administrator; b. Liège, 16 Feb. 1783; d. Brussels, 15 Jan. 1875. After he had finished his classical education in Belgium, he went to Paris, where he studied with Fourcroy, Lacépède and Cuvier. On returning to Belgium he observed the geologic strata of northern France, and was thus led to undertake a geological map of the empire. This he did, having been exempted from military duty by the government for that purpose. Though much of the task was completed in 1813, the map was not published till 1822. At the same time d'Halloy held many governmental positions. He was mayor of Skeuvre (1807), of Braibant (1811), sous-intendant of the arrondissement of Dimant (1814), general secretary of the province of Liège (1815), governor of the province of Namur (1815), counsellor of state, senator (1848). In 1816 he became a member of the Academy of Brussels, of which he was president from 1850 on. From 1842 on he was a corresponding member of the Paris Academy of Sciences. Besides a vast amount of material in scientific periodicals he published 'Description Géologique des Pays-Bas' (Namur 1828); 'Elements de géologie' (Namur 1831); 'Introduction à la géologie' (Namur 1833); 'Géologie de Belgique' (Brussels 1842); 'Des races humaines' (Paris 1845); 'Code administratif' (Namur 1827); 'Notions de Statistique' (Namur 1840).

O'MALLEY, ò-mă'l'ĭ, Frank Ward, American journalist; b. Pittston, Pa., 30 Nov. 1875. He studied architecture, drawing and painting, taking special courses at the University of Notre Dame, Indiana, and at the Pennsylvania Academy of Fine Arts. He was engaged as an illustrator in New York in 1902-06, also producing light verse, and since 1906 he has been on the New York *Sun* where his humorous and special articles have become widely popular. He collaborated with E. W. Townsend in writing the plays 'The Head of the House' (1909) and 'A Certain Party' (1910).

O'MALLEY, Grace (called also GRAINE NĪ MAILLE, GRANY O'MAYLE, GRAINNE O'MAILLEY, GRANY NE MALE, GRAYN NY VAYLE, GRAINE MHAOL, etc.), Irish chieftainess; b. West Galway, about 1530; d. possibly on Clare Island, about 1600. She came of the O'Malley clan, famous sea-rovers, and was a daughter of Dubhara O'Malley, chieftain of Umhaill Uachtarach Uí Mhaille. She was married twice and had children by both marriages, her first husband being Domhnall-an-chogaidh O'Flaherty and her second Richard MacOileverius Burke. She was famous as a leader in the Elizabethan wars, and in command of a considerable fleet made many forays against British shipping and coast settlements. In 1576 she and her second husband made an alliance with Sir Henry Sidney at Galway, but in 1577 she was captured by the forces of the Earl of Desmond while on one of her forays and was held captive for a

time. She then continued her warring expeditions; was suspected of plotting against the government with the Earl of Thomond, the Burkes, Lord Birmingham and others, and she threatened the life of Theobald Dillon when he came into the country. However, she is afterward recorded as peaceably paying taxes with her husband. In 1586, after the death of her husband, she moved to obtain letters of conduct from Sir Richard Bingham, but was seized and sentenced to be hanged for a plundering expedition against Aran Island. She was released through the efforts of Richard Burke, "The Devil's Hook," said to be her son-in-law. She enjoyed his protection until his rebellion, when she took refuge in Ulster, being unable to return home because of the loss of her ships. She was afterward pardoned by Queen Elizabeth, but is reported to have continued her former course. She petitioned the restoration of one-third of her husband's lands in 1595, but apparently spent her last years in poverty. Innumerable legends grew about her career, few of which can be substantiated. Consult 'Calendar of State Papers, Ireland' (1574-75, 1588-92, 1592-96); O'Flaherty's 'Chorographical Description of the West, or H-Iar Connaught' (ed. by Hardiman, Dublin 1846).

O'MALLEY, Thaddeus, Irish Roman Catholic clergyman: b. Garryowen, near Limerick, 1796; d. Dublin, 2 Jan. 1877. He was ordained in 1819 and came to America, but through his independent ecclesiastical action was suspended in 1827 and returned to Dublin, where he became assistant at the cathedral under Archbishop Daniel Murray and worked indefatigably for the passage of poor-laws for Ireland. He was appointed by the government rector of the Catholic University at Malta, but because of the reforms introduced by him among the students he was dismissed. In 1845 he founded the *Social Economist* and later the *Federalist*, both of which he used in the interest of Ireland and to unite the Old Ireland and Young Ireland parties. He was often under ecclesiastical censure for the freedom with which he attacked the discipline of the Church; was an earnest advocate of the home-rule movement, and published 'A Sketch of the State of Popular Education in Holland, Prussia, Belgium and France' (1840); 'Harmony in Religion' (1870); 'Home Rule the Basis of Federation' (1873), etc. Consult Webb, 'Irish Biography.'

OMAN, ʿo-man, Charles William Chadwick, English historian: b. Mozufferpore, Bengal, India, 12 Jan. 1860. He was educated at Winchester and Oxford, was a Fellow of All Souls' College, Oxford, from 1883; deputy professor of modern history at Oxford 1900 and full professor in 1905. He is the author of 'A History of Greece' (1888); 'Warwick, the King Maker' (1891); 'A Short History of the Byzantine Empire' (1892); 'A History of Europe 476-918' (1893); 'A Short History of England' (1895); 'History of the Art of War in the Middle Ages' (1898); 'History of the Peninsular War' (5 vols., 1902-14); 'Seven Roman Statesmen' (1902); 'The Great Revolt of 1381' (1906); 'A History of England before the Norman Conquest' (1910); 'Welling-ton's Army' (1912).

OMAN, ʿo-mān, Arabia, a sultanate at the southeastern extremity of the peninsula, gen-

erally comprised in the maritime district extending along the Persian Gulf, the Gulf of Oman and the Arabian Sea, from El Hasa to Merbat, near the Hadramut frontier. Area, 82,000 square miles. Although mainly a maritime kingdom, Oman proper is the richest part of the Arabian Peninsula, both in agricultural products and in mineral treasures. The working of gold and silver filigree, with which daggers, belts, cups and pipes are often adorned in Oman, supports great numbers in the larger towns. The inhabitants are tolerant, but superstitious and immoral. The form of government is a monarchy, limited by a powerful aristocracy with hereditary privileges, and the prescription of popular rights. The ruler is called the imam or sultan, and the capital of the state is Muscat (q.v.), a name also given to the sultanate. The present dynasty secured possession of the throne in 1741, and for some time Socotra, Zanzibar and parts of the east coast of Africa were attached to Oman. A British Resident is stationed at Muscat, the sultanate being virtually a British protectorate. Population, consisting of numerous tribes, is estimated at 500,000.

OMAR I, ʿo-mar, 2d caliph after Mohammed; d. Medina, 3 Nov. 644. See CALIPH.

OMAR II, 8th caliph of the Omaides. See CALIPH.

OMAR, ʿo-mār, Mosque of, or KUBBET ES LAKHRA ('THE DOME OF THE ROCK'), a structure in Jerusalem believed to have been erected by Omar, the second of the Mohammedan caliphs. The mosque is built over the rock which the Jews regarded as the place where Isaac was to have been sacrificed; and, in the belief of the Mohammedans, the scene of Mahomet's ascent to heaven. The mosque is octagonal, 66 feet to a side, and the dome is 97 feet high and 65 feet in diameter. There are four porches and numerous pointed windows inlaid with rare Persian tiles and now filled with beautiful 16th century stained glass. The walls are covered with fine Byzantine mosaics. The original Byzantine temple has been much modified by the Mohammedans. The Arabians believe the mosque to have been built by Abd al Malih in the 7th century.

OMAR KHAYYAM, khī-yām', Persian poet and scholar: b. Naishāpūr, province of Khorassan, latter part 11th century; d. (according to tradition) 1123 (517 A.H.). His name is given as Ghjās uddīn Abul Fath Omar ibn Ibrahim al-Khayyām. The epithet Khayyām, signifying "tent-maker," is indicative of his calling previous to the time when he was able to devote himself to science and literature. Nizām ul Mulk, the great vizier of Al Arslan and Malik Shāh, offered him preferment at court, but he requested instead the means of living in retirement and occupying himself with learning. He accordingly received a pension, and pursued researches, especially in mathematics and astronomy. Subsequently he was made astronomer royal at Merv, and in that capacity prepared certain astronomical tables. He was also active in the revision (dating from 15 March 1074) of the ancient Persian calendar, a work comparable to the revision of the Julian calendar by Gregory XIII to which it was similar in principle, and superior to which it has been ranked by some authorities. Among

his mathematical writings are a work on algebra and a study of 'The Difficulties of Euclid's Definitions,' both still preserved. His work on algebra was the most notable contribution of his country and age to the study of mathematics. He was the first to make an attempt to scientifically classify equations of the first degree and to consider cubes from the standpoint of the general equation. But though he did much he left much to be done by future mathematicians; for all his work was more specific than general. In his religious views he was unorthodox, and therefore viewed with suspicion by many of his contemporaries. He is best known to the West in later times as a poet somewhat in the manner of Lucretius, but more in that of Ecclesiastes. This philosophy he set forth in 'Rubāiyāt' (quatrains), of which, according to convention, the first, second and last lines rimed (the rime being in many cases even quintuple), while the third line was for the most part blank, but rarely followed the rime of the other lines. Each Rubāi was distinct, and in extant manuscripts is placed in an alphabetical arrangement dependent upon the letter concluding the rime. About 500 quatrains are assigned to Omar; many are probably not his. Perhaps his heretical views had something to do with the fact that a comparatively small number of manuscripts exists, and none can be made an authority. The manuscripts also vary more or less in the number of quatrains which they include. Edward Fitzgerald made of a selected portion of the quatrains an ingenious mosaic which presents something of unity, but probably gives too consistent a structure to the pessimistic side of Omar. The Persian seems to have been of changeable mood, sometimes humble before Allah, again reproachful or defiant; hopeful and fatalistic; rebellious and acquiescent. He often ridiculed the orthodox, and perhaps he liked to confuse and perplex them. "For this," says Fitzgerald, "he is said to have been especially hated and dreaded by the Sufis." The Sufi poets, however, found it convenient to borrow of Omar, whose material they presented in their own mystic guise. Nevertheless, Omar had training in the Sufi doctrines, and some have detected a symbolic and mystic significance in his work. The generally known rendering into English is that by Fitzgerald (1859; later ed.), whose version was republished (1900) by Batson and Ross with commentary and introduction. There are also translations by Whinfield (2d ed., 1893) in his edition of 500 quatrains, a scholarly work; Payne (1898); and Heron-Allen (1898). There is a volume on the 'Sufi Interpretations of the Quatrains of Omar Khayyam and Fitzgerald' by Bjerregaard (1902). There are numerous versions in other modern languages, and Elihu Vedder published (1884) a series of illustrations which have been much praised.

Consult Bjerregaard, 'Sufi Interpretations of the Quatrains of Omar Khayyam and Fitzgerald' (New York 1902); Batson, H. M., a new edition of Fitz-Gerald's translation with commentary; Browne, E. G., 'A Literary History of Persia' (New York 1906); Dole, N. H., 'Rubayat of Omar Khayyam' (Boston 1896); Jackson, A. V. W., 'From Constantinople to the Home of Omar Khayyam' (New York 1911); Payne, 'The Quatrains of Omar Khay-

yam' (with biographical and critical introduction, London 1898); Thompson, E. F., 'The Quatrains of Omar Khayyam Translated' (Worcester, Mass., 1906); Shirazi, 'Life of Omar al-Khayyāmi' (Chicago 1905).

OMBAY, ōm-bī', or **ALLOR**, Malay Archipelago, one of the Sunda Islands, about 20 miles northwest of Timor, from which the Ombay Pass, in the line of one of the best routes from Europe to China, separates it. It is about 900 square miles in extent, 65 miles long and 15 broad, and presents a bold coast and lofty interior. The mountains are covered to their summits with lofty trees. It is inhabited by semi-savage tribes, and carries on some trade with Timor in birds' nests and provisions, exchanged for iron-work, Chinese wares and linen. Allor on the northwest and Bailoko on the southeast are the chief settlements and ports. It belongs to the Netherlands, and is included in the residency of Timor.

OMBOS, ōm'bōs (mod. **KÔM UMBOO**, or **KOM OMBO**, "the hill of Umboo"), ancient Egyptian town on the east bank of the Nile, about 500 miles above Cairo. The town has long been in ruins and is uninhabited, but the remains of the magnificent temples built in the time of the Ptolomies were cleared of sand and rubbish in 1893. The town itself is still buried in sand. Ombos was an unimportant town, notwithstanding its strategic position on a hill commanding both the Nile and the road from Nubia to the Nile Valley, until the Ptolemaic era. It then became capital of the separate nome of Ombites and it was at this time that the temples were built. The great temple was enclosed within a wall of crude bricks, remains of which still stand, except on the side toward the Nile. The temple is double and was devoted to the worship of Jebek and of Har-oer or Aröeris. There are also remains of a smaller Ptolemaic temple nearer the river and partially washed away. Consult Mariette, A. E., 'Monuments of Upper Egypt' (London 1877); Demorgan, J., 'Kom Ombo' (Vienna 1894).

OMBRE, ōm'bēr, a game of cards originating in Spain. It is usually played by three persons, with 40 cards (the eights, nines and tens having been removed), and each player receives nine cards, three by three. The game is often mentioned in English 18th century literature.

OMBU (ōm'boo) **TREE**, also known as **BELLASOMBRE-TREE**, **UMBRA-TREE** and **POKE-TREE**, a South American shade-tree (*Phytolacca dioica*), widely cultivated as a shade tree in Spain, Malta and other countries on the Mediterranean Sea and in India. The tree attains a height of 25 to 35 feet, is extraordinarily wide at the base of the bole, sometimes reaching a diameter of 12 to 15 feet, and has a wide-spreading top with extremely dense foliage. The leaves are large, and the whitish flowers are borne on spikes, the fruit being similar in appearance and in medicinal qualities to that of the plant or shrub variety of pokeweed.

OMDURMAN, ōm-door'mān, Sudan, a native town on the White Nile, opposite Khartum. It was built as the capital of the Mahdi's successor when Khartum was destroyed in 1885, and extends for several miles along the river

bank. Under the Khalifa Abdallah it had a population of 500,000 inhabitants, living mostly in one-storied mud huts, lining streets laid out on an orderly system, and guarded by a walled enclosure flanked with towers, accommodating 10,000 warriors. When the Khalifa was defeated, 2 Sept. 1898, by the Anglo-Egyptian troops under Lord Kitchener, Omdurman was hastily deserted, but with returning trade and prosperity has an estimated population of 60,000. Omdurman is the great mart of the gum-arabic, ivory and ostrich-feather trade of north-eastern Africa, and representatives of over 30 tribes congregate in its markets.

O'MEARA, ò-mā'ra, **Barry Edward**, English physician: b. Ireland, 1786; d. London, 3 June 1836. He was household physician to the Emperor Napoleon I at Saint Helena and published 'Napoleon in Exile' (1822). Originally a surgeon in the British navy, he was serving on the *Bellerophon* in that capacity, 7 Aug. 1815, when Napoleon went on board. Napoleon noting O'Meara's skill and knowledge of Italian desired the surgeon to accompany him to Saint Helena. Having obtained Admiral Keith's permission, O'Meara remained with the ex-emperor till July 1818. He was then recalled and deprived of his rank for having accused Sir Hudson Lowe before the Admiralty of cruel and arbitrary conduct. He published a very interesting work, 'Napoleon in Exile' (1822).

O'MEARA, **Stephen**, American journalist b. Charlottetown, Prince Edward Island, 26 June 1854; d. 14 Dec. 1918. He settled in Charlestown, Mass., with his parents when 10 years of age and in 1872 was graduated from the Charlestown High School. In 1872-74 he was a reporter on the *Boston Globe*, and in 1874 he joined the staff of the *Boston Journal*, of which he ultimately became editor-in-chief and publisher. He sold the *Journal* in 1902 and retired, but later became police commissioner of Boston.

OMEGA, ò-mē'ga or ò-mē'g'a, the last letter of the Greek alphabet; hence, figuratively speaking, the end or last of anything. See ALPHA.

OMEN, a sign believed to prognosticate a future event, between which and the event foretold there appears no relation of cause and effect, but which is usually received as an intimation from a superior power. Omens have been common among most nations, and are often remembered and mentioned after they have ceased to be credited. Though generally classed among superstitions, they may sometimes be founded on some hidden relation in things, some natural law of sequence the ground of which is unknown. They have been chiefly in vogue in the ruder ages and communities, though under the name of auguries they retained their influence during the whole period of pagan antiquity. Eminent warriors and other popular leaders in moments of extreme doubt and peril have given notable examples of faith in them. Sneezing was deemed ominous in the time of Homer, and Eustathius states that it was lucky or unlucky according as it was directed to the right or the left. Aristotle discusses the problem why sneezing from noon to midnight is good, and from midnight to noon bad. At noon it was propitious. Among the ancient Persians sneezing was es-

teemed fortunate, a sign of contest between the fiery soul and the earthly body, and of the victory of the former. When the emperor of Monomotapa sneezes, says Codignas, it is proclaimed throughout the whole land as a signal for general joy. That this belief in the danger of sneezing was pretty general is seen in the fact that in Germany and the Germanic languages and in the Latin tongues generally it is a custom to use some exclamation when one sneezes. The Spaniard says, "Jesus," that is, "may Jesus protect you!" and the German says, "Gesundheit" (health), that is, "may good health come of it." The itching of the nose implied that a stranger was coming. Burton, in his 'Anatomy of Melancholy,' states that "to bleed three drops at the nose is an ill omen." The spots on the finger nails were all omens; the itching of the palm of the right hand promised a receipt of money; the doubling of the thumb within the hand was believed to have efficacy in avoiding approaching danger, and therefore the thumbs of dead persons were so folded. The way in which fires, candles or lamps burned suggested divers omens. The superstition still prevails in many places that the howling of a dog by night presages a death in the neighborhood because the dog symbolized the spirit that carried the souls of the dead to the future world. Duncan Campbell expresses his faith in this omen, and adds: "Odd and unaccountable as it may seem, those animals scent death, even before it seizes a person." The screeching of the owl and the croaking of the raven have both in ancient and modern times been regarded as omens of some dire calamity. Divers presages concerning the weather have been derived from the habits of birds, bees, wasps and gnats. Pennant states that many of the great families of Scotland received monitions of future events, especially of death, by spectres, wraiths and shrieks. Fishermen and sailors discover omens in echoes, flashes, shadows and other visible appearances. To throw a cat overboard or lose a bucket is believed to be unlucky. Whistling is supposed to stir up the wind, because originally whistles were used in the worship of the different divinities of the air. The same custom prevailed in Mexico and thousands of ceremonial copper bells have been found in ancient tombs in that country and Central America and parts of South America, where they were used for the same purpose. The Plains Indians of the United States use bone whistles in their ceremonial dances, and they were especially in use in those ceremonies devoted to the gods of the air. Stumbling has been the subject of numerous superstitions. Gaius Gracchus stumbled at his threshold on the morning of his death. To stumble on going out, says Bishop Hall, was mischievous; to stumble up stairs, says Grose, was lucky.

At the present day, in many parts of England and the United States, a superstitious belief in omens exists. It is regarded as unlucky to see first one magpie and then more; but two denote marriage or merriment; three, a successful journey; four, an unexpected piece of good news; five, that you will shortly be in a great company. To kill a magpie is to incur some terrible misfortune. When a person goes out on any important business, it is lucky to throw

an old shoe after him. To present a knife, scissors, razor or other sharp or cutting instrument to one's friend is unlucky, as they are apt to divide love and friendship. The falling of salt toward persons at table, the spilling of wine on their clothes, are evil omens. Breaking a looking glass betokens the death of the best friend of the person to whom it belonged. The burning of the cheeks or tingling of the ears, that others were talking of us; if of the left cheek or ear, ill; the right, well. A sow crossing the road before a person going on a journey is believed to indicate a disappointment if not a bodily accident to such person; but if the sow is attended by her litter of pigs, it denotes a successful journey.

From the belief in omens there came to be derived elaborate systems of palmistry and astrology which were simply certain specific omens classified and connected with specific rules, regulations and manner of procedure in divination. Naturally omens came to play a large part in the religions of most of the races of the world. On the other hand, many of the omens had their origin in religious ceremonies, customs and beliefs. Consult Dennefeld, Ludwig, 'Babylonisch—assyrische Geburts—Omina' (Leipzig 1904); Thurston, E., 'Omens and Superstitions of Southern India' (London 1912); Toy, C. H., 'Introduction to the History of Religions' (Boston 1913).

OMER PASHA, ô'mër pash'â, Turkish general: b. in the Austrian village of Plasky, 24 Nov. 1806; d. Constantinople, 18 April 1871. His real name was Michael Lattas, and his parents were Christians. Educated for the Austrian army, for some unrecorded reason he fled, in 1828, to Bosnia, and, embracing Mohammedanism, obtained the post of writing-master to Abd-ul-Medjid, the heir-apparent to the Ottoman throne. In 1842 he was appointed military governor of the Lebanon; in 1843 he suppressed an insurrection at Albania, and in the following years others in Bosnia and Kurdistan. He defeated the Russians in 1853 at Oltenitza, again at Silistria in 1854, and entered Bucharest. On 17 Feb. 1855 he repulsed, with great loss, 40,000 Russians who attacked him at Eupatoria. In October of that year he was sent to relieve Kars, but arrived too late. In 1857 he became governor of Bagdad, but he was dismissed from office in 1859 on a charge of maladministration in office. In September 1861 he was charged with the pacification of Bosnia and Herzegovina, which were again in insurrection. This being accomplished, he attacked the Montenegrins, captured Cetinje and overran the country in 1862. He was made field-marshal in 1864, was sent to suppress the rebellion in Crete in 1867 and was Minister of War from 1869 until his death.

OMMANNEY, ô'm-măn'ē, SIR ERASMUS, British admiral: b. London, England, 1814; d. Portsmouth, England, 21 Dec. 1904. He entered the navy at the age of 12, and three years later was present at the landing of the British army at Lisbon. He was at the battle of Navarino, in 1827, on board the *Albion*, throughout the action, acting as aide-de-camp to the captain, and was the last survivor of that battle, which resulted in the destruction of the Turkish fleet. In 1835 he was promoted to the rank of lieutenant, immediately volunteering to serve with

Capt. James Ross in an expedition to relieve whaling vessels beset in the ice in Baffin's Bay, and was commended for his services. Attaining the rank of captain in 1846, he was placed second in command of the Arctic expedition to search for Sir John Franklin (q.v.), and was first to discover traces of the missing ships. He was knighted for these services. In the Crimean War he commanded the British expedition sent to the White Sea to damage Russian ports. Afterward he served on the coast of Central America, his last active command being as senior officer in charge of the naval establishment at Gibraltar. He was generally known as the 'Father of the British Navy.'

OMMIADS, ô'm-mi'adz, **OMMAYYADS**, or **UMMAYYAS**, a dynasty of Arabian caliphs or "successors" of Mohammed, founded by Moawiya I, general of the Caliphs Umar and Usman (Omar and Osman). After the death of Osman, the grandson of Ummaya, in 644, Moawiya seized his kingdom and became the first caliph of the dynasty. He captured the island of Rhodes, destroyed the Colossus, one of the Seven Wonders of the ancient world, and carried devastation to the walls of Constantinople, which he besieged unsuccessfully for seven years. Moawiya had been an early follower of Mohammed, who made him his secretary, while Omar made him governor of Syria, which he held as a possession for nearly 40 years. He died A.D. 680 and was buried at Damascus, the capital of Moslem government. With him began the great schism in Islam, which is still divided into the two sects of the Shiites and Sunnites (Shiah and Sunni), the former recognizing the only hereditary lineage from Mohammed through his daughter Fatima and her husband, Ali, and the latter accepting the line of the first caliph, Abu Bekr, father-in-law of the Prophet. The Ommiad dynasty produced 13 caliphs after Moawiya, viz., Yezid I, Moawiya II, Marwan I, Abdul Malik, Walid I, Suleiman, Omar, son of Abdul Aziz, Yezid II, Hasham, Walid, Yezid III, Ibrahim and Marwan II, the last of the Ommiads, defeated and crushed by the Abbasides in 750. The Cordova caliphate, founded by the Ommiads in Spain, lasted 281 years longer, till 1031, but was not recognized as the true caliphate, and did not, in fact, assume such title till 170 years after the fall of the Ommiads. Marwan II was the last of the line, the bravest and best of the Ommiads; he was slain and mutilated 5 Aug. 750. See CALIPHATE; HASAN and HUSAIN. Consult Muir, W., 'The Caliphate' (London); Lane-Poole, S., 'Mohammedan Dynasties.'

OMNIBUS, a Latin word signifying "for all," and now applied in several languages to the well-known vehicle used for the conveyance of passengers at a cheap rate. The famous mathematician, Blaise Pascal, is said to have introduced the vehicle in Paris. Pascal was more or less interested in the affairs of practical life. He was the inventor of the push-cart that now perambulates our streets. In 1661 he had large wagons built for regular traffic in the heart of Paris. He allied himself in this undertaking with several influential friends, among whom was the Duke de Roannes. In 1662 Louis XIV granted letters patent to Pascal, in which it was said that these carriages were intended

for the comfort of poor people who had to go to courts of justice, or who were sick and so poor that they could not afford to pay the two pistols exacted by the chairmen and the drivers of coaches. At first the use of the vehicle was not generally permitted. A royal decree forbade its use by soldiers, pages, lackeys and other liveried servants, as well as artisans and porters. Pascal, in spite of the fact that he only lived to be 39, is said to have made no inconsiderable sum out of his invention. After the vehicle had been in use for some 16 years, it was abandoned for various reasons. It was not until 1812 that it was again introduced, this time in Bordeaux, which city was followed in 1821 by Nantes and in 1827 by Paris. A Mr. Shillibur started the first omnibus in London in 1829, and they were introduced into New York in 1830 and Amsterdam in 1839.

OMNIBUS BILL. See **COMPROMISE OF 1850.**

OMOO: A NARRATIVE OF ADVENTURES IN THE SOUTH SEAS, Herman Melville's sequel to his 'Typee' (q.v.), appeared in 1847, and went through five editions the same year. In it he recounts the incidents of his voyage from Nukahiva, on board the barque *Julia*, to the Society Islands, where he took part in a mutiny and was left with several companions on the island of Tahiti for still further cheerful vicissitudes. Unlike 'Typee,' a smiling, languid idyl of life in a tropical valley, 'Omoo' (the word means "rover") is packed with activity and comedy. One cannot be sure how far the narrative is a trustworthy account of Melville's own experience, but there is the look of reality about his racy sailors, his consuls and beachcombers, and his irresponsible natives, hovering between cannibalism and a barely-guessed-at Christianity. The treatment of the missionaries led to much controversy with others of that profession, and Melville was, indeed, often caustic and contemptuous toward them. What should be borne in mind, however, is that the story is dramatic; that the teller has just emerged from a world of Edenic simplicity; and that his recollection of that little world lends a touch of sharpness to his judgments of the figures he finds on the borders of civilization. Undoubtedly, he was something of a partisan of paradise; and yet the book takes its quality, its keen edge, not so much from his prejudice as from his comic force and the happiness with which he hit off the manners and personages of a heterogeneous community.

CARL VAN DOREN.

OMOPHAGIC RITES, or OMOPHAGIA (Greek, *omophagia*, eating raw flesh), religious rites in which uncooked flesh was eaten. In such religious ceremonies cannibalism sometimes formed a part, as in the Orphic rites, in which the passion of Zagreus (q.v.), the infernal Dionysus, was commemorated by the sacrifice of a man, who was dismembered and eaten. These rites were celebrated at Chios and Tenedos, and from them Dionysus obtained the title of eater of raw fish. Dionysus rites were introduced into Italy about the end of the 3d century B.C. and in 189 B.C. the Senate, informed of their nature by a freeman who had been marked out as a victim, issued the decree "Concerning the Bacchanalian Rites," which banished

the Orphic mysteries from Italy. A ram or an ox was afterward substituted for a human victim in the Dionysian celebrations. See **DIONYSUS; BACCHUS; ORPHEUS.**

O'MORE, ò-mòr, Roger, or Rory, Irish revolutionist: flourished 1620-52. He came of the O'More family, descended from the ancient chiefs of Leix, and which after the establishment of Queens County is said to have raised 19 rebellions. Rory O'More was largely responsible for the Ulster uprising in 1641, in which, with Sir Phelim O'Neill and others, he planned the capture of Dublin Castle, and although that enterprise failed he achieved a victory at Juliantown, County Meath. After the failure of the Ulster uprising a price was put on his head, and he is thought to have gone to Flanders. He was later connected with the fortunes of Owen Roe O'Neill; served Antrim in his Scottish expedition in 1644; was in arms against the Kilkenny confederation in 1648; and after fighting in Connaught in the uprising of 1650 he was compelled to flee and died in obscurity.

O'MORE, Rory, or RURY OGE, Irish revolutionist, second son and namesake of a captain of Leix: d. 1578. He was continually engaged in rebellion, but in 1565, or 1566, he received a pardon. In 1572, however, he is recorded as in arms against the queen, and in 1574 he was taken prisoner after aiding in Kildare's plots. He soon obtained his freedom, and in 1575 submitted to the authorities, obtaining a second pardon in 1576. In 1577, in the expectation of help from Spain and under the encouragement of John Burke, he again renewed hostilities, burned Naas and Carlow, but was later captured and killed by the Fitzpatricks, who set his head on Dublin Castle.

OMRI, òm'ri, in the Bible, a king of Israel after the separation of Israel and Judah; his reign is variously placed as 926-915 B.C.; 903-872 B.C.; 900-875 B.C.; 890-879 B.C. He commanded the armies of Elah (1 Kings xvi, 16) and was engaged in the siege of Gibbethon, which was in the possession of the Philistines, when the death of Elah occurred. Omri was proclaimed king by the army and went at once to Tizrah, where he made war against Zimri, the occupant of the throne, and gained possession of the kingdom. His title to the throne was then contested by Tibui, who had been elected by the people who desired a non-military king, and a civil war lasting four years resulted in Omri's complete victory. He then removed his capital to the mountain of Shromron, where he established Samaria, a place of great beauty in a fertile country and possessed of high strategic value. He made unsuccessful war against Assyria, and endeavored to strengthen his position through the marriage of his son to a Phœnician princess. Through this alliance Baal-worship was introduced, causing the downfall of the dynasty after some 50 years. He conquered the Moabites, and appears to have established a considerable degree of power, since his house furnished four kings to Israel, an unusual record at that time. He is mentioned on the Moatile Stone of Mesha, and in the cuneiform inscription the house of Israel is called Bit-Humri, "the house of Omri." He is further mentioned in 1 Kings xvi, 25; 2 Chron. xxii, 2; Cant. vi, 4; 1 Kings xx, 34;

xxii, 3; and Micah vi, 16. Consult Rawlinson, 'Historical Evidences'; Hastings, 'Dictionary of the Bible'; Wellhausen, 'History of Israel.'

OMSK, Asiatic Russia, the former capital of western Siberia, now capital of the general-governorship of the Steppes and of the province of Akmolinsk, on the Irish at the confluence of the Om, and on the Trans-Siberian Railway, 280 miles southeast of Tobolsk, and 1,624 miles from Moscow by rail. It has modern fortifications in the form of the regular polygon, flanked with five bastions, and is the most important military station on the line of the Irish. It has gymnasia, a seminary for teachers, a technical school and the West Siberian section of the Russian Geographical Society. It is an important industrial and commercial centre and is the chief distributing point for western Siberia; and the construction of the Trans-Siberian Railway has added greatly to its commercial importance. Pop. over 130,000.

ON CONCILIATION WITH AMERICA. The speech of Edmund Burke, "On Moving his Resolutions for Conciliation with the Colonies," was delivered before the House of Commons on 22 March 1775. Burke was thoroughly prepared for this great effort, both through his familiarity with the best models of eloquence, 'Demosthenes and Cicero,' and through his study of books describing America and the Americans and of fiscal and commercial statistics, as he himself suggests: "Having no sort of reason to rely on the strength of my natural abilities, . . . I was obliged to take more than common pains to instruct myself in everything which relates to our Colonies." The elaborate, but not obtrusive, structure of the speech is Attic, the amplification Ciceronian, the fervor Hebraic. The grotesque comparisons which occasionally marred the eloquence of Burke are here virtually absent. Analysis shows that the introduction or exordium, aims to secure the good will of the audience by minimizing the influence of the speaker: "I persuaded myself that you would not reject a reasonable proposition because it had nothing but its reason to recommend it." The status is distinct: "The proposition is peace." The statement of facts gives the six causes of the fierce spirit of liberty in the colonists: descent, form of government, religion in the North, manners in the South, education, and remoteness from England. The main argument or proof leads up to and includes the resolutions with which Burke wishes the House of Commons to conciliate this spirit. Then comes the refutation of objections and, finally, the peroration: for the services desired of the colonies, England must rely, not on compulsion, but on their interest in the British Constitution and on the affection arising from kindred blood, similar privileges, and other ties, "which though light as air are as strong as links of iron." The speech as a whole well illustrates Burke's extraordinary powers of assimilation, his subtlety, his directness, his rich and comprehensive imagination, his knowledge of human relations. Many of the sentences take firm hold upon the memory: "Nobody shall persuade me, when a whole people are concerned, that acts of lenity are not means of conciliation"; "A great empire and little wits go ill together"; "I do not know the method of draw-

ing up an indictment against a whole people." Consult Cook's edition of the 'Speech on Conciliation' (New York 1896), and Grierson, H. J. C. (in the 'Cambridge History of English Literature,' Vol. XI).

LANE COOPER.

ON LIBERTY. John Stuart Mill's essay 'On Liberty,' among the most carefully written of his works, was published in 1859 when he was 53 years of age. It was planned in 1854 and revised with great care with the co-operation and helpful criticism of his wife. It is justly one of the most famous of all his writings; it is closely reasoned and contains his most characteristic political doctrines. In political theory, Mill was a modified individualist, believing that every man should be allowed all liberty compatible with the liberty of his fellows. In the introduction to the treatise 'On Liberty' he mentions the danger to which his attention has been called by the course of world events. He shows how the conflict between liberty and authority led to the demand that rulers should become responsible to their subjects. Then in his own generation a new evil appeared—the tyranny of the majority might supplant the tyranny of the rulers; for, when the masses have become conscious of their power, they will probably be as tyrannical in legislation as in public opinion. In this respect he differs from Bentham and James Mill, who assumed that all ends would be secured by making the sovereign the servant of the people. He vigorously pleads the case for complete freedom of thought and discussion and even goes so far as to urge the doubtful point, that contradiction, even when the truth is contradicted, is desirable in itself. He is inclined to regard authority as something logically opposed to reason and to accept the doctrine of the "right of private judgment," although in all the fields of his activity he was more concerned to find truth than to maintain a creed. Mill believed, furthermore, that the law should not interfere with purely personal conduct. He held that "the individual is not accountable to society for his actions in so far as these concern the interests of no person but himself." In other words, his central principle defended liberty of tastes and pursuits and freedom to unite for any purpose not involving harm to others. In fact there should be no legislative interference unless it helped the individuals restrained. Throughout the entire work Mill clings to some extent to the notion that state interference, as such, is an infringement of liberty with an implied prejudice against any interference at all.

Mill thought there was a lack of the true spirit of liberty in the society of his generation and that some legislation might help and some legislation might hinder its growth; he plainly stated that it was not the laws, but the spirit of the people who execute them that preserves or destroys liberty. He does not complain against the state and its organization, but against the stupid and intolerant spirit of its citizens. His ideal demands a state whose members are really proud of their individuality. He believed that utility was the ultimate standard of all value which, in the largest sense, must be "grounded on the permanent interests of man as a progressive

being." He held that there were "certain social utilities which are vastly more important and, therefore, more absolute and imperative than any others are as a class," and the greatest of these, in Mill's opinion, was liberty, which he truly considered the foundation of all human happiness, although it could not be secured and maintained merely through legislation.

To summarize, three distinct propositions regarding the relation of the state to liberty seem to be implied in Mill's treatise, besides the valid principle that compulsion cannot be employed to effect what in its essence is a spiritual end: (1) That an increase in the power of the state is prejudicial to liberty. This presupposes that state action and liberty are directly opposed to each other. He seems to overlook the fact that there might be an alternative between state interference and no interference at all. (2) That a distinction can be drawn between the part of human life "in which it is chiefly the individual that is interested" and the part "which chiefly interests society," and that liberty is infringed if the state interferes with the former. (3) That, as the most valuable element in human life is spontaneous choice, anything which is done through compulsion diminishes the scope of that choice and thus infringes liberty and stifles creative ability.

The keynote of Mill's method is found in the individualism which he inherited from the 18th century—a doctrine of *laissez-faire*, which meant that the sole end of government is to protect each individual in the possession of the product of his labor. Considered in the light of the 20th century Mill's fault was lack of faith in the ability of society to improve itself by political machinery. The liberty he praises is a very positive ideal; in fact, he imagined himself to be doing much more than urging the inestimable value of the spirit of liberty. He professed to discover a principle which should enable future generations to ascertain which type of legislation impairs that spirit—in other words, a just conception of the relation of society to liberty.

Mill's work 'On Liberty' has much more than mere historical importance. It is an eloquent and reasoned appeal on behalf of a principle whose recognition Mill thought to be the most valuable thing in society, and it has, as such, a permanent value and interest. While the trend of modern thought has been so far away from individualistic standards that Mill's renown has been somewhat obscured, his influence on his generation would be difficult to overestimate. Next to Herbert Spencer's 'Social Statics' and 'Man Versus The State,' Mill's essay 'On Liberty' is probably the finest expression of that political individualism which pervaded and dominated mid-Victorian England. Consult Mill, John Stuart, 'On Liberty' (1859, People's ed.); id., 'Autobiography' (1873; new ed., 1908); Stephen, Leslie, 'The Utilitarians' (Vol. III is devoted chiefly to Mill's work, especially pp. 60, 244-281); Ritchie, D. G., 'Principles of State Interference' (1891); Graham, W., 'English Political Philosophy from Hobbes to Maine' (1899); Douglas, Charles, 'John Stuart Mill, A Study of his Philosophy' (1895); Whittaker, Thomas, 'Comte and Mill' (1909); Buckle, H. T.,

HARRY J. CARMAN.

ON NE BADINE PAS AVEC L'AMOUR

('One must not trifle with love,' 1834) is important in the writings of Alfred de Musset, both because it is the most poignant of his dramas and because it is first to mark a change in the whole character of his literary production. He had met George Sand in August 1833, had gone with her to Italy in October, had returned alone in April 1834. One insignificant poem was the sole fruit of that interval. This play and 'Lorenzaccio,' both written in the later half of 1834, show no longer the freshness of youth and fancied sorrows but the bitter reality of actual suffering, a tormenting self-questioning, sometimes a desperate pessimism. Though the title is proverbial, 'One must not play with love,' is not technically what French dramaturgy calls a *Proverbe*, like Musset's 'Il faut qu' une porte soit ouverte ou fermée' or 'Une caprice.' These were society scenes, eminentlyactable. 'One must not trifle with love,' was the last of Musset's plays to be acted (1861) and is indeed quite unsuited to the stage. A chorus, in old-fashioned French, fills interludes with comments on the action, somewhat after the fashion of the Greeks. A baron, a tutor, a curé and a governess furnish with their complacent self-importance a sedately comic relief to the tragedy of young Perdican's play with the love of his cousin Camille and her foster-sister Rosette. Flitting from one to another with care-free, vagrant fancy, at last he discovers, too late, the inestimable jewel of which he has made a sport; Camille, truly loving and beloved, finds Rosette dead at Perdican's renunciation of her devotion and leaves him as the curtain falls, hopeless, in the consciousness of his unattonable guilt, herself not guiltless, yet with a broken heart.

BENJAMIN W. WELLS.

ON THE SUBLIME (Περὶ Ὑψους), "the

most striking single piece of literary criticism produced by any Greek writer posterior to Aristotle," and a work whose popularity is attested by the fact that it has been translated into at least 12 languages, including Dutch, Swedish, Polish and Russian, is a treatise addressed to one Terentianus by a certain Dionysius or Longinus or anonymous writer (according to different manuscripts) and for a long time was commonly ascribed to Cassius Longinus, the Greek rhetorician of the 3d century. But the equivocal testimony of the manuscripts, the absence of direct references in ancient authors, the names included in the treatise or absent from it, the writer's affinities in style, in thought and in general standpoint—such considerations when taken singly cause hesitation and when taken together raise the most serious doubts as to the truth of the traditional view. In the light of recent research it has come to be recognized that the external evidence in favor of attribution to the historical Longinus is of a highly dubious character, and that the internal evidence seems to point to the 1st century rather than the 3d as the period within which the treatise was prob-

ably written. Gaps exist in the manuscripts amounting to about one-third of the work and this fact is the source of hope for the future solution of the problem by the discovery of a more complete manuscript. The object of the author is to indicate broadly the essentials of a noble and impressive style. He defines sublimity as a certain distinction and excellence in expression and remarks that innate elevation of tone can be regulated by acquired art. After a brief account of defects of style opposed to sublimity, such as tumidity, puerility, misplaced passion and frigidity, the following five sources of the sublime are enumerated: (1) grandeur of thought, founded on nobility of character; (2) vehement and inspired passion; (3) figures of speech, such as adjuration, rhetorical questions, asyndeton and hyperbaton; (4) noble phrasing or diction, into which enter such elements as choice of proper and striking words, metaphors, similes and hyperboles; (5) elevation in arrangement of words. By way of conclusion, the author in a notable passage endeavors to trace the causes of the dearth of great literature in his own day and decides that it is traceable to decay of liberty or spread of wealth and luxury. The treatise may be considered as a disquisition not only on the formation of style, but on literary criticism in general. It is a veritable storehouse of quotations, from at least 50 Greek writers, illustrating the excellencies and defects of matter and form. Such familiar topics of modern criticism as correctness, standard of taste and comparative method are not neglected by the author. There is a good English translation (with the Greek text *en regard*) by W. Rhys Roberts (Cambridge 1899). The introduction and the appendices of his work give a good survey of the problems involved and of the bibliography to that date.

HERBERT F. WRIGHT.

ON THE SUBLIME AND BEAUTIFUL. Edmund Burke's 'A Philosophical Enquiry into the Origin of Our Ideas of the Sublime and the Beautiful' appeared in 1756. In later editions it was much enlarged and provided with an introductory discourse on 'Taste.' Though but remotely connected with the major interests of his career, this work of his early manhood exhibits the characteristic marks of his comprehensive and penetratingly reflective mind, and it occupies an interesting place in the history of aesthetics. Previous critics, Burke complains—he might have mentioned Addison—make existing works of art the measures of new artistic creations; and this practice leads to an unfruitful imitation of models and to traditional judgments. He is inspired by an acceptance of the philosophy of Locke to discover by direct investigation of human nature the physical causes of the various qualities of emotion experienced in the presence of works of imagination. He finds that ideas capable of powerfully impressing the mind are related either to self-preservation or to society. Those which are related to self-preservation turn mainly on pain or danger, as ideas of terror, obscurity, power, privation, vastness, infinity, difficulty, etc.; and these contribute to the effect of sublimity. Those ideas which are related to society turn mainly on gratification and pleasure, and excite affection, tenderness, and the objects which thus

affect us we call beautiful. Burke distinguishes a pure æsthetic emotion for beauty in general from the passion excited by the beauty of woman, in which lust mingles; but his analysis of beauty is distinctly from a masculine point of view. "We submit," he says, "to what we admire, but we love what submits to us." Having examined and dismissed the more or less current notions that beauty is determined by proportion, by utility or by virtue, he finds the properties of a beautiful object in relative smallness, smoothness, gradual variation, delicacy and clear mild color. Taking issue with Shaftesbury who in the 'Characteristics' had represented morality as essentially a province of fine art, he remarks that those whom most people choose as companions of their softer hours are never persons of shining morality or strong virtues—"it is rather the soft green of the soul on which we rest our eyes." Beauty, he contends, is in general relaxing; and to speak of virtue as beautiful "has a strong tendency to confound our ideas of things, and has given rise to an infinite deal of whimsical theory." His distrust of æsthetic morality is manifestly related to his study, in which he anticipates a main line of modern psychology, of the physiological bases of emotion. Discussing in his section on Words the means by which painting and poetry gain their respective effects, he anticipates also some of the central distinctions of Lessing's 'Laokoon' (q.v.). His relation to Lessing is discussed by W. G. Howard in 'Publications' of the Modern Language Association (Vol. XXII, 1907).

STUART P. SHERMAN.

ONA, ὄνα, or **AONIH**, ὀνί, a group of South American Indian tribes living in the district surrounding the Strait of Magellan and in Tierra del Fuego. They constitute one of the three distinct Fuegian races, each of which appears to be of different stock and to possess an individual language. They are a low type of savage although physically well developed. Their family ties are of very slight order, they have no chiefs, build only the flimsiest of huts and despite a rigorous climate go almost naked. They live chiefly by hunting and fishing; and are skilful in the construction and use of bark canoes and in basketry. Consult Martial, L. F., 'Mission scientifique du Cap-Horn' (1838).

ONA, Pedro de, pā'drō dā ὀñā, Chilean poet: b. Confines, Chile, about 1571; d. in battle about 1620. He was educated at Lima (then Los Reyes del Peru), and there wrote his great epic poem, 'Arauco Domado' ('Chile Conquered,' 1596; re-edited 1849), which is reckoned a Spanish classic, being included in the Spanish Academy's 'Catalogo de Autoridades de la Lengua,' as well as various sonnets and the descriptive poem, 'Temblor de Lima el Año de 1607' ('The Lima Earthquake of 1607,' 1609). So popular was his work in his day that it had many imitators, some 40 of whom were well-known poets. His work had more influence upon the Spanish literature than had that of any other Spanish colonial writer with the probably one exception of the Mexican poetess, Sor Juana Inés de la Cruz.

ONAGER. See **ORDNANCE**.

ONAGRACEÆ. See **EVENING PRIMROSE**.

OÑATE, Juan de, hoo-än' dā ö-nä'tā, Spanish explorer: b. Guadalajara, Mexico, about 1555; d. about 1615. He was a man of position and influence in the colony, a son of the founder of Guadalajara, and he married a granddaughter of Cortés. In 1595 permission was granted him by the viceroy, Velasco, to colonize the district north of the Rio Grande, but Monterey, Velasco's successor, withheld full powers as governor until 1598, when Oñate set out on his expedition from Zacatecas with 400 soldiers, 130 of whom had families, and many wagons and cattle. He crossed the Rio Grande, founded San Juan, the first capital of New Mexico, and, notwithstanding conflicts with the Indians, the colony flourished. In 1599 and 1604 Oñate explored Arizona, probably part of Kansas, and though records show that he was not governor of the colony after 1608, there is nothing by which to accurately determine the date of his death. Gaspar de Villagrā, a captain who accompanied Oñate, has left a long epic poem in which Oñate is made the hero of the narration; and from this the chief events of Oñate's life have been gathered, in so far as they are known.

ONAWA, ön'a-wa, Iowa, town, county-seat of Monona County, within five miles of the Missouri River, on the Illinois Central and Chicago and Northwestern railways, 37 miles southeast of Sioux City. It is the centre of an excellent agricultural and stock-raising region and has a considerable local trade. It has public schools and a public library (founded in 1867). Pop. 2,256.

ONAWAY, ön'a-wa, Mich., village in Presque Isle County, 130 miles north of Saginaw, on the Detroit and Mackinaw Railroad. It is situated in a region devoted to fruit and stock-raising and has a lumber trade and manufacturing. Pop. 2,789.

ONCORHYNCHUS, the genus of the andromous *América* and Asiatic *Salmonidae* which includes the salmon of the north Pacific. It is so called from the hooked jaws of the spent males. It is also the King salmon. These salmon are of great importance on account of their large size and excellent qualities. See SALMON.

ONE HUNDRED COMMITTEE, the name given an organized body of New York citizens, who during the occupation of Manhattan by Lord Howe were intent upon maintaining their independence. Governor Tryon, the British commander, was so intimidated by the committee he feared for his personal safety and took refuge on board a British sloop-of-war. The committee gave courage to the Sons of Liberty who removed the cannon from the royal battery at the foot of Broadway to a place of safety for the use of the people.

ONEGA, ö-nyé'gä, (1) a lake in Russia, near the centre of the government of Olonetz, after Ladoga the largest lake in Europe, covering an area of about 3,700 square miles. It is of irregular shape, has generally rocky shores, and numerous creeks, bays and islands, and is well supplied with fish. Numerous shoals and sand-banks interrupt its navigation. It is fed chiefly by the Migra, Shuia or Shuisk, Vodla and Vytegra, and discharges itself into Lake Ladoga by the Svir. A canal between the Vyte-

gra and the Kayla, an affluent of Lake Bielo, gives it an opening into the basin of the Volga. (2) A river to the east of Lake Onega, which, issuing from Lake Lacha, government of Olonetz, flows first northeast, then northwest, and after a course of about 270 miles, so much broken by falls and rapids that it cannot be considered as navigable, enters the White Sea at the southeast extremity of the Gulf of Onega.

ONEIDA, ö-ni'da, N. Y., city in Madison County, on the New York Central and Hudson River, the West Shore and the New York, Ontario and Western railroads, about 110 miles in direct line west by north of Albany, the State capital. The place was settled in 1839, at the opening of the Utica and Syracuse Railroad, now the New York Central and Hudson River Railroad, and was incorporated as a village 20 June 1848. It was granted a city charter 28 March 1901. It is the commercial centre of a fertile agricultural region and has considerable manufacturing interests. The chief manufacturing establishments are chair factories, push cart works, casket and carriage factories, knitting mills, steel pulley works, cigar factories, canneries, iron works, milking machines and milk bottle caps. There are about 1,800 employees in the manufactories. It has a large trade in its own manufactures and in farm and dairy products and fruit. It has a city hospital, a private hospital, an old ladies' home, an excellent high school, many fine churches, athletic field of 11 acres, also playground of two acres.

Oneida Lake (q.v.), five miles north by west, is a popular outing place. The Oneida Community (q.v.) is located two miles to the south, and Oneida Castle, the site of the ancient headquarters of the Oneida Indians, adjoins Oneida. The three banks have a combined capital of \$235,000, and the annual amount of the business is about \$30,000,000. The government is vested in a mayor and six aldermen. The city owns and operates the waterworks. Pop. 10,541. Consult Durant, 'History of Oneida County.'

ONEIDA, a lake in New York, on the boundaries of Oneida, Oswego, Madison and Onondaga counties, about 18 miles south of the eastern part of Lake Ontario. It is 25 miles long and about 5½ miles wide. Several small streams flow into the lake and the head-waters of those from Oneida County are near the source of the Mohawk River, and the outlet of which is Oneida River whose waters enter Lake Ontario through Oswego River. Sylvan Beach, on the east bank, is a favorite resort and a number of small villages are along the shore. The lake has a few islands.

ONEIDA COMMUNITY, a settlement of Communists (see COMMUNISM) at Oneida, Madison County, N. Y., sometimes called Perfectionists. The community was founded in 1847 by John Humphrey Noyes (q.v.). He had originally formed a small settlement of his fellow-men at Putney, Vt., in 1838. During the first 10 years the settlement at Oneida made slow progress, but eventually became very successful, as a result of numerous industries and manufactures. The community followed a complex marriage system, there being no ceremony nor permanent ties between couples, and the community assumed all responsibility in the sup-

port and education of children. According to the Oneida doctrine on marriage, love does not consist with selfish claims "and no more permits exclusive appropriation of persons than of things." Marriage, therefore, was "complex" and not "simple." Men and women in the community were free to cohabit at pleasure; but the propagation of children was theoretically under the control of the society and conducted professedly on scientific principles. Outside opposition, principally from the Protestant churches, arose, and the marriage system was abolished in 1879. The community reorganized and constituted itself a joint-stock company in 1881, and the co-operative plan was followed in financial and domestic matters, but the community of property and the distinctively social life were given up. A common dining-room, laundry, library and assembly hall are features still retained of the old community life. Each member has now a separate individual interest represented by shares of stock in place of the former undivided interest in the common property. A guarantee of support was given to all elderly and infirm persons in lieu of stock and also for the support and education of the children of the community, in 1882, until they should be 16 years of age. Co-operative privileges were limited to the members of the Oneida Company and their children and could be extended to others only with the unanimous consent of the subscribers to the original agreement. In 1882 the community had property valued at \$600,000. Since the reorganization branch manufactures have been established at Niagara Falls, Sherrill and Kenwood, N. Y., and in 1903 the total valuation of community property was said to exceed \$2,000,000. There were then upward of 300 persons in the community which has since grown very considerably. Consult Hinds, 'American Communities' (1902).

ONEIDA INDIANS (Oneyotka-ona, "people of the stone" or from the Iroquois "tiionen-iote"—"where the rock is"), a tribe of the Iroquois confederacy of Indians formerly living on the shores of Oneida Lake, N. Y., from which their territory extended through central New York southward to the Susquehanna. They were friendly to the French and the Jesuits, but they took sides with the Americans in the Revolutionary War. Subsequently they were attacked by the hostile Iroquois under Brant who burned their villages and forced them to take refuge in the American settlements. A considerable number of them settled on the Thames River, Ontario, Canada, where about 800 survivors lived in 1903. Others reside in Wisconsin, New York and on the Grand River, Canada. About 300 Oneidas are still in New York State; over 2,000 in Wisconsin; about 800 on the Canadian Thames reservation in the province of Ontario; while others form part of the Grand River (Ontario) reservation or of the several Catholic Iroquois colonies. See also SIX NATIONS.

O'NEILL, ð-nēl', Owen Roe ("RED OWEN"), Irish warrior: d. 6 Nov. 1649. He was the nephew of Hugh O'Neill, Lord of Tyrone, and was educated at Louvain and in France; and subsequently distinguished himself as the commander of the Irish troops in the service of Spain. The wholesale confiscation in the north

of Ireland known as the "Plantation of Ulster" caused a general uprising of the Irish of which O'Neill assumed the command and of the Irish forces in the wars against the English in the first half of the 17th century. On 5 June 1646, with 5,000 men he routed Monroe's army of 7,000, killing one-half of the enemy. Turning rapidly around, he defeated two other armies of 2,500 each. For two years he continued to be victorious in battles in which he was generally largely outnumbered; and only his sudden death ended his victorious career.

O'NEILL, SIR Phelim, Irish rebel: b. about 1603; d. Dublin, 10 March 1653. He was a kinsman of the Earl of Tyrone and was active in the rebellion of 1641. He was a member of the Irish Parliament at Dungan-non in 1641 and joined forces with the Earl of Antrim to support the cause of Charles I in Ireland. He was leader of the band which captured Charlemont Castle and he later became commander-in-chief of the forces of the north. Failing to gain support from the Scottish settlers in the north he ravaged a goodly portion of Ulster on a pretended necessity for reducing their opposition to the king's forces. He was unsuccessful in his siege of Drogheda Castle in 1642 and losing the confidence of his followers he was succeeded by his kinsman, Owen Roe O'Neill. His fortunes never rallied after this although he had expected to be restored to his old command, particularly after his kinsman's death in 1649. He took part in the battle of Scariffhollis and played a notable part in the defense of Charlemont Castle against the forces of Parliament but was compelled to capitulate in 1650. He remained in hiding for a time but was captured, tried for treason and executed.

O'NEILL, SIR Turlough Luineach, EARL OF TYRONE, Irish chieftain: b. County Ulster, about 1530; d. September 1595. He was a cousin of Shane O'Neill, and after vain endeavors to supplant him in the clan succeeded him on his death in 1567. He then pledged loyalty to Queen Elizabeth but without any apparent intention of supporting the government or abandoning the practices of his predecessor in his leagues with the Scots and defiance of authority. An expedition was sent against him in 1574, under the command of the Earl of Essex, but met no success and ended in the extension of O'Neill's land grants and other privileges, including the maintenance of 300 Scottish mercenaries. He further gained royal approbation in 1578 in his creation as Baron of Clogher and Earl of Clanconnell for life. Subsequently, however, he again entered into conspiracy against the government, meantime ravaging the lands of neighboring clans. The government then took up the claims of his cousin Hugh for the chieftainship of the clan Tyrone and after many changes in fortune he was forced to yield in 1593. Two years later he attempted to regain control of the clan but was repulsed, his castle of Strabane was razed by his cousin and Turlough took refuge in some nearby ruins, where he died.

ONEIROTECHNICS, also called **DREAM ANALYSIS**, an ancient and at various times reputable or disreputable pastime which has in modern times been entirely revised and recast and constitutes in modern psychological thought

an earnest and intense field for scientific investigation. The dream is thus considered a definite product of the body's activity. Behind its apparent meaninglessness it has much serious meaning. Although frequently expressed in unintelligible phrases, it is only nonunderstandable to those who are without comprehension; as a foreign language, Chinese or Choctaw for example, have meaning for those who understand. As Lanier puts it:

"Then sight and sound: Then space and time, then language, mete and bound, and all familiar forms, that firmly keep man's reason in the road. Change faces, peep betwixt the legs, and mock the daily round."

Behind this mocking, however, the unconscious peeps through, and in that modern psychotherapeutic method, psychoanalysis, the dream is used as a royal road into the unconscious. By means of the careful analysis of the dream the unconscious motives of the dreamer are made known to him to better his mental adaptations to reality. Consult Jelliffe, 'Technic of Psychoanalysis.'

ONEONTA, ō-nē-ōn'ta, N. Y., third class city in Otsego County, on the Susquehanna River, and on the Delaware and Hudson Railroad, is the terminus of the Ulster and Delaware Railroad, which connects with the West Shore at Kingston, and of the Southern New York Railways Company, formerly the Otsego and Herkimer Railroad, which connects with the New York Central lines at Herkimer and Utica. The town of Oneonta was settled prior to the Revolution, but the first settlement within what is now the city limits was made in 1790 by Frederick Brown. It was incorporated as a village in 1848. It is in an agricultural region which is a most productive dairy country, more milk being produced within a 25-mile radius of Oneonta than in any other section of New York State. The chief manufacturing establishments are the Delaware and Hudson shops, which have approximately 1,000 employees (aside from 750 trainmen who live here); cigar factories, 75 employees; knitting mill, 100 employees; flour and feed mills, 100; shirt factory, 100; silk mill, 100; only American plant making Sanatogen, 20; overall factory, 125; novelty works, 14; miscellaneous, including two wholesale grocery houses, 60. It is the seat of the Oneonta State Normal and Training School which had enrolled in 1915 nearly 1,100 non-resident students. It has the Aurelia Fox Memorial Hospital, a State armory, a public library, a new government building and post office, a new municipal building, country club with a nine-hole golf course, three city club houses, a chamber of commerce having 250 members and a paid secretary, and 12 churches. The government is vested in a mayor and council with subordinate boards employing paid officials. Pop. 10,500.

ONIAS, a Jewish high priest, the son of Simon. About 188 B.C. he fled to Egypt, where he built the temple of Leontopolis, or rather he remodeled an old pagan temple given to him by the Egyptians. This Leontopolis was located near Heliopolis, 180 stadia from Memphis, and must not be confounded with the Leontopolis of the Delta. There is more or less obscurity regarding Onias, and from various accounts there appears to have been three of this name. Josephus declares that the builder

of the Leontopolis was a son of Onias who fled to Egypt in the time of Antiochus V, about 164 B.C. Another account says that Onias III was murdered by Andronicus in a sanctuary near Antioch. In Isaiah (xix, 18-25) reference is made to five cities in Egypt, occupied by the Hebrews, one of them called Leontopolis (the city of the Lion); and also to an altar and sacred tower at the border of Egypt where the Egyptians are expected to offer sacrifices to Yahweh. Consult Duncan, J. G., 'Exploration of Egypt and the Old Testament' (New York 1909); Herzfeld, L., 'Geschichte des Volkes Israel' (Vol. II, Leipzig 1863); Naville, E., in 'Egyptian Exploration Fund Memoir' (London 1888); Petrie, 'Hyksos and Israelite Cities' (London 1906).

ONION, a river in Vermont. See WINOOSKI.

ONIONS, ūn'yūnz, Oliver, English novelist: b. about 1876. His earlier work was that of a designer and commercial artist and he subsequently wrote for *Le Quartier Latin* in Paris and contributed war drawings to London periodicals. Turning his attention to fiction he achieved a considerable success. He wrote 'Little Devil Doubt' (1909); 'In Accordance with the Evidence' (1912); 'The Debit Account' (1913); 'The Story of Louie' (1913); 'Gray Youth' (1914); 'Mushroom Town' (1915); 'The New Moon' (1918), etc.

ONIONS AND ONION CULTURE, various species of *Allium*, a genus of the lily family; specifically, *A. cepa*, a bulbous-rooted biennial herb with hollow radical leaves and a leafless, hollow, usually swelling stem, which bears an umbel of small six-segmented bell-shaped white or pinkish flowers, replaced in some cases by bulblets. It has been so long in cultivation that its original form is not definitely known. Probably it is a native of western Asia and adjacent parts of Africa, since it is mentioned in old Egyptian writings, the Pentateuch, etc. It has spread to all countries occupied by civilized man, by whom its bulbs (and to some extent its leaves) are used as a vegetable and for flavoring various culinary preparations. The annual onion crop of the United States amounts to more than 6,000,000 bushels.

Being very hardy, the onion may be planted as soon as the ground can be worked in early spring, or it may be cultivated during the winter where the temperature does not fall to the freezing point. In the Southern States it is generally cultivated as a winter crop. The essentials of its cultivation are a well-drained, light, friable soil, rich in all plant food and humus and, above all else, free from weeds. Onions, especially while little, cannot compete with weeds. Reclaimed marshes, such as are used for celery, are highly valued also as onion fields. Every effort having been made to make the soil as loose as possible, the seed is sown in drills about 12 inches apart, machines being used for the purpose. Since the plants are somewhat slow in making their appearance, and are very inconspicuous, planters often mix a few radish or turnip seeds with the onion seed, the young radishes being quick to appear, conspicuous, easy to remove and serving to indicate the positions of the rows until the onion plants can be seen. Throughout the growing

season the onions are kept free from weeds, thinned to distances about three inches apart, and the soil between the rows is kept loose and open by frequent cultivation. When the necks of most of the bulbs have turned yellow in the autumn the bulbs are pulled, four or five rows being combined in one windrow, and the "scullions," or thick-necked, immature bulbs, discarded. After drying in the field for a few days the bulbs are gathered in crates, which are piled under cover for further drying before sorting and shipping them to market. Dryness, coolness (just above freezing) and soundness are essentials in storing onions during the winter.

Onion cultivation has several modifications of importance. Improved methods of culture consist in starting the plants in hotbeds or cold-frames and transplanting them to the field when four or six inches tall, and thereafter cultivating them as above described. The advantages claimed for this method are that the plantlets are under complete control while small—the precarious time; that they are readily transplanted under ordinary conditions; that the cost of transplanting is not greatly in excess of that of weeding in the other method; and that not only is there a more even stand in the field, but that the bulbs are larger and of more uniform grade. Another frequent practice is the sowing of seed in the autumn where the plants are to remain; and a still more common one is the planting of "sets,"—little onions which have been specially grown for this purpose, the seed being sown very thickly the year previous. These sets are especially valued for the production of "bunch onions," which appear in the markets during the early spring and summer months.

Some varieties of the onion are remarkable for their method of propagation. The potato or multiplier onion has two or more "cores" or "hearts," each of which will send up leaves when the bulb is planted. If separated from its fellow hearts, each core will produce a new compound bulb and sometimes send up a flower-stalk. This variety is, therefore, a perennial which resembles garlic in its method of propagation and is intermediate in flavor between garlic and the common onion. Another botanical variety is the "top" or "tree" onion, which develops bulblets instead of flowers, or both, at the top of the flower-stems.

Of the varieties of the common onion grown in America, the red ones are usually of strongest flavor, the yellow ones next and the white ones mildest. But still milder and better flavored are the foreign varieties known as Bermuda, Spanish, etc., which are less hardy than the common kinds and are little grown in the North. They are largely cultivated in the South and in California, whence the markets derive their chief supply.

The Welsh onion or "cibol" (*Allium fistulosum*) is a native of Siberia. It resembles the leek in the absence of a distinct bulb, but differs from the leek in its hollow, onion-like leaves, which are cut like those of the shallot and used for flavoring. It is of dwarfer growth than the common onion and has more clustered leaves. It may be propagated by division of the bulbs or by seeds. In the United States it has not become very popular.

Onions are occasionally seriously attacked

by parasitic plants, which may devastate whole fields and which are not of easy control by any devised method. Bordeaux mixture has been recommended, but rotation, the crop being planted upon smut-free land, is perhaps most satisfactory.

Among the insects which prove destructive to the onion are several species of cut-worms, especially *Agrotis messoria*. All of these may be held in check by poisoned baits, such as sweetened bran or clover, or by trapping in early spring when the insects revive after passing the winter in the larval stage. The onion thrips (*Thrips tritici*), a tiny sucking insect, sometimes devastates whole fields by appearing in great numbers, puncturing the leaves, which turn yellow wherever pierced. It is especially troublesome in Bermuda. Kerosene emulsion has been most frequently recommended as a remedy. The most serious pest, however, is perhaps the onion maggot, the larva of a fly (*Phorbia ceparum*) which lays its eggs close to the young onions in early spring. The larvæ burrow into the young bulb, causing the plant to wilt and decay, a result which follows even slight injury. In late spring the maggots pupate and in about two weeks appear as adults, which lay eggs for a second brood. This brood winters partly as adults and partly as pupæ. The best remedy is probably ground tobacco-stems liberally applied to the young plants in early spring. This acts as a repellent, an insecticide and as a fertilizer, and may be applied without fear of its injuring the plants. Another good plan is to pull and burn the plants of the early sowing when found to be wilting, which will lessen the number of flies able to lay eggs for the second brood. Nitrate of soda and kainit are recommended to be sown broadcast after the removal of the wilted plants; these are thought to act as insecticides and fertilizers. Consult Bailey, 'Cyclopedia of American Horticulture' (1900-02) and the special literature therein mentioned under the article *Onion*.

ONKELOS (Aramaic for the Greek name Akylos or the Latin Aquila), author of the Targum or Chaldee paraphrase of the Pentateuch which bears his name. According to the Babylonian Talmud he lived in the time of Gamaliel, but not earlier than the 2d and not later than the 3d century. He was a disciple of Gamaliel and at his funeral is said to have revived an ancient custom by burning costly material to the value of 70 minæ. His Chaldee is purer than that used in Palestine, and he may have been a Babylonian. His version is good, and continued until the beginning of the 16th century to be chanted in the synagogues alternately with the Hebrew. It has often been printed with or without the Hebrew text. It is supposed to have received its definite form in Babylonia in the 3d century A.D. The Samaritan Targum of the same date is evidently based upon the same authority. Another Targum on the law, known as the pseudo Jonathan, edited in Palestine in the 7th century A.D., while based on the same interpretation, is fuller and closer. See TARGUM.

ONNES, òn'nès, Heike Kamerlingh, Dutch physicist: b. Gröningen, 21 Sept. 1853. He was educated at the University of Gröningen, and after acting as assistant at the Delft Polytech-

nic he was called to Leyden where he became professor of physics and director of the physical laboratory. He is noted for his researches in low temperatures, his study of helium and his discovery of the possibility of perpetual electric current through metals at certain temperatures. He was awarded the Nobel prize in physics in 1913, and is a member of the Royal Institute of Great Britain. He is author of numerous works on physics, among them 'Over het Aereiken van temperaturen belangrijk beneden het kookpunt van helium' (1910); 'Experiments at the Cryogenic Laboratory at Leyden' (Vienna 1910; Eng. ed., 1911), etc.

ONODI, ō'nō-dē, Adolf, Hungarian physician: b. Budapest 1857. He was graduated at the University of Budapest in 1881, and in 1886 became lecturer in anatomy there. He later specialized in laryngology, became lecturer in that branch in 1894 and since 1896 has been professor. Author of 'Die nasenhöhle und ihre Nebenhöhlen' (1893; Eng. trans., 1895); 'Die Anatomie und die Physiologie der Kehlkopf-nerven' (1902); 'Die Nebenhöhlen der nase beim kinde' (1912), etc.

ONOFRITE. An ore of mercury consisting of the sulphose lenide, Hg(S,Se), containing about 81 per cent of the metal. An ore formerly mined at Lucky Boy mine, six miles southwest of Maryvale, Utah.

ONOMACRITOS, ōn-ō-māk'ri-tūs, Greek soothsayer and poet, who lived in the time of the Pisistratidæ, 6th century B.C. At Athens he was the head of an Orphic sect and expounded the mysticism, poetry and theology of Musæus, while his pupils arranged the Homeric poems in connected series in accordance with the suggestion of Pisistratus. Having been detected making an interpolation in one of these oracles, he was banished from Athens by Hipparchus about 516 B.C. He withdrew to Persia, where the Pisistratids employed him to encourage Xerxes to invade Greece by repeating to the king such oracles as seemed to promise success. Consult Ritschl, F. W., 'Onamakritos von Athen' in his 'Opuscula' (1866).

ONOMASTICON, a Greek term properly meaning a list of names or words, denotes particularly a dictionary or encyclopedia of proper names. More specifically, the work of Pollux, executed in the 2d century B.C., in the Greek tongue.

ONOMICHI, ō'nō-mē'chē, Japan, seaport in the prefecture of Hiroshima, on the main island of Japan, 190 miles southwest of Kioto on the Inland Sea. There are numerous temples and the streets are narrow and picturesque. The town has a thriving trade and an increasing population. Pop. 30,367.

ONONDAGA, ōn-ōn-dā'ga, a lake in New York, near Syracuse. The outlet is Seneca River. Onondaga Castle, the headquarters of the Onondaga Indians (q.v.), was near this lake.

ONONDAGA ("on the top of the mountain") **INDIANS**, an American tribe of the Iroquois confederacy residing in central New York, on the shores of Onondaga Lake and on the mountain of the same name, in the terri-

tory now occupied by Onondaga County. Their territory also extended northward to Lake Ontario and southward indefinitely, some say, as far as the Susquehanna. Among the Iroquois they were called the "Name Bearers"; but their chief village was Onondaga. Previous to 1681 it was situated on a hill, which now forms part of the town of Pompey. It was afterward removed several times but was always placed on high ground where it could be the more easily defended. Hence the name "Onondaga" given to these people by their enemies, and later by Europeans. Their present Indian reserve is in the region of their later tribal home. About one-half of the original Onondaga people followed Brant to Canada and settled on the Grand River in the province of Ontario where they still reside and are divided into nine clans. In the federal councils of the Six Nations, the Onondagas acted as a sort of presiding judge to settle questions upon which the other tribes could not agree. In 1682 the Onondagas, then considered the chief of the Iroquois tribes, made a treaty of peace in Albany, in behalf of the Mohawk, the Oneida and the Cayuga, with representatives of the colony of Maryland and of the Piscataway Indians. In the negotiations that took place, for a number of years, with a view to promoting peace between the tribes of the north and those of the south of the Saint Lawrence and the Great Lakes, the Onondagas took a prominent part. At first they were opposed to the confederacy which was finally made up of the "six nations." The Onondagas early showed a liking for the Christian colonies formed by the Catholic missionaries on the Saint Lawrence (among the Iroquois) and gradually members of the tribe went over to them singly or in small bodies until, by the middle of the 18th century, about half the Onondagas had emigrated to Canada; but this did not prevent them from keeping on friendly terms with neighboring tribes, until the Revolution broke out in 1775 when they and the Iroquois joined issue with the British. This is why at the close of the Revolutionary War the Onondagas removed, for the most part, to their present reservation on the Grand River, Canada. The rest of the Onondagas are all on several reservations in New York State. The Onondagas at one time numbered probably over 3,000; but in 1851 Morgan, who knew them well, estimated their population at 500 in the United States and 400 in Canada. In 1906 the Onondagas in New York State numbered 553 and those in Canada about the same figure. Consult Bruce, D. H., 'Onondagas' Centennial' (Boston 1896); Clark, J. V., 'Onondaga' (Syracuse 1849); Hale, Horatio, 'The Iroquois Book of Rites' (ed. 1883); Hodge, 'Handbook of American Indian Tribes of North America' (Washington 1910); Jarvis, S. F., 'Religion of the Indian Tribes of North America' (New York 1820); Le Mercier, F. J., 'First Settlement at Onondaga' (1654-58); Millet, Pierre, 'De la mission de Saint Jean Baptiste' (Quebec 1858); O'Callaghan, E. B., 'De Frontenac's Expedition against the Onondagoes' (1696).

ONOSANDER, more correctly **ONESANDER**, a writer on military tactics who lived at Rome in the middle of the 1st century after Christ, and composed in Greek, under the title

of *Strategitikos*, an excellent work on the art of war.

ONOSPIN, in chemistry, $\text{C}_{60}\text{H}_{88}\text{O}_{26}$. Produced, together with formic acid, by boiling ononin with baryta water. On passing carbonic acid gas into the solution, and digesting the precipitate in boiling water, onospin deposits on cooling, as a white, interlaced crystalline mass, insoluble in ether, but soluble in alcohol and the alkalis. It is colored crimson-red by sulphuric acid and binoxide of manganese and melts at 162° .

ONOTO, ò-nō-tō, a tribe of South American Indians. They inhabited the eastern shore of Lake Maracaibo, lived chiefly by fishing, and built their houses on platforms over the water, supported by piles driven into the lake bottom. Ojeda found them living thus in 1499, and from the analogy fancifully named the country Venezuela (namely Little Venice). Similar dwellings are found in this region though the tribe as an entity, chiefly through slavery, long ago became extinct. Onoto is also the vulgar name in Venezuela of a plant of the Bixaceae family known as Bixa Orellana. It is also the name of a municipality in the district of Cajigal, Venezuela, which contains over 5,000 inhabitants.

ONTSLOW, George, French composer: b. in Clermont-Ferrand, France, 27 July 1784; d. there, 3 Oct. 1853. He was a grandson of the 1st Lord Onslow, and was sent to London to finish his education. After studying there with Cramer, Dussek and Hüllmandel, he completed his musical education under Reicha in Paris. He was elected to succeed Cherubini in the French Academy in 1824. He attempted to write for the theatre but his operas were only a moderate success. He composed many beautiful quartets, sonatas, symphonies and other instrumental pieces that are still popular. His operas include 'L'Acalde de la Vega' (1824); 'Le Colporteur' (1827); and 'Le Duc de Guise' (1831).

ONTARIO, Cal., city in San Bernardino County, on the Southern Pacific, Santa Fe, Salt Lake and Pacific Electric Line, 40 miles east of Los Angeles. Citrus fruits, grapes, peaches and apricots are grown extensively in the locality and the city has a large trade in these products. The dairy business and alfalfa growing are extensive interests in the immediate vicinity. There are also three canneries, nurseries, packing-houses, and a large electrical supply manufactory. The city has a public library and a splendid high school plant. The Chaffey Agricultural College is an institution in the city recently established and is of great importance to the city and this portion of the State. The Chaffey Library belonging to these two educational institutions has an endowment of \$80,000, which gives it a high educational value. The water supply system is the property of the municipality as well as the Ontario Power Company. The three local banks have a combined resource amounting to \$2,000,000. The actual valuation of real property is \$7,613,550, with a tax rate of \$1.86 per \$100. Pop. 7,280.

ONTARIO, Canada, formerly called UPPER CANADA, the first in population and wealth and the second in area of the province of the Dominion. It is bounded on the north by Hud-

son Bay and on the south by the Great International Boundary lakes, on the east by the province of Quebec and west and northwest by Manitoba. It is 1,000 miles in extent from north to south and about the same distance from east to west. Its area, 407,262 square miles, of which 41,382 are water, is three and a half times that of the British Isles. For administrative purposes the province is divided into 38 counties, subdivided into townships and electoral districts. The capital is Toronto (q.v.) and Ontario also contains the Dominion capital, Ottawa (q.v.), situated in the eastern part of the province. Other important cities are Hamilton, London, Fort William, Windsor, Kingston, Brantford, Peterborough, Guelph and Saint Catharine's (qq.v.).

Topography and Physical Features.—The surface generally is an undulating plateau land with no considerable elevations. The Laurentian Hills, with a maximum altitude of 2,120 feet, extend westward from the Thousand Islands near Kingston to north of Lake Simcoe and constitute the watershed separating the rivers flowing into the Great Lakes from those entering Hudson's Bay and the Ottawa and Saint Lawrence rivers. The rocks underlying the superficial deposits may be broadly classed as follows: (1) Paleozoic rocks, embracing 30 per cent of the area of the province, including limestones, shales and sandstones; and (2) pre-Cambrian rocks, including granites, volcanic rocks, quartzites and other sediments. The chief rivers are those already mentioned, with the Attawapiscat, Severn, Moose and Albany, entering James Bay, and in the Saint Lawrence Basin the Moira, Trent, Grand, French, Thames and the Niagara, the celebrated falls and gorge of the latter belonging partly to the province and partly to the United States. Besides portions of the Great Lakes, thousands of smaller lakes including Nipissing, Nipigon, Abitibi, Saint Joseph, Scugog, Simcoe and Muskoka belong to the province.

Natural Resources.—A great part of the province is covered with timber, chiefly pine, spruce, tamarack, oak and hickory, with water facilities making lumbering one of the principal industries. It is reckoned that there are 100,000,000 square miles of forest areas, exclusive of the district of Patricia; and there are 21,934 square miles of forest preserves. A great pulp and paper industry has been established, the principal works having been established at Iroquois Falls. The value of the forest products is \$40,000,000 annually. Fur-bearing animals, the mink, otter, skunk, beaver, are obtained in considerable numbers in northern Ontario, which is also a popular hunting-ground for moose, caribou and other large game. Fisheries are important, the catch consisting of trout, whitefish, herring, pickerel, etc., in 1916 being valued at \$3,341,182. The province is exceedingly rich in minerals, which include the entire list of metallics and non-metallics, except coal. The principal metals are nickel, copper, silver, gold and iron, in addition to lead, zinc, cobalt and platinum. The non-metallics include petroleum, natural gas, salt, gypsum, lime, clays, stone and marble, arsenic, corundum, feldspar, mica, graphite, talc, pyrite, etc. In 1883 nickel was discovered at Sudbury, the deposit since proving to be the richest in the

world, the district holding with New Caledonia a world's monopoly of the metal, and Sudbury leading with 75 per cent of the whole. The province is rich in petroleum, the wells in the southwest, especially in Lambton County yielding immense and apparently inexhaustible supplies, over 30,000,000 gallons annually, while the same may be said of the salt wells on the shores of Lake Huron. Natural gas fields in the east near Niagara and in the west, near Detroit, supplying Buffalo and Detroit, respectively, have been exploited to the value of about \$300,000 annually. Ontario's mining production in 1917 constituted a record, totalling \$71,060,942, of which metallic production was \$56,845,788 and non-metallic \$14,218,269. The values included gold, \$8,698,831; silver, \$16,193,293; copper in matte, \$7,842,890; nickel in matte, \$20,943,500; pig iron, \$1,016,699; cement, \$2,934,271; iron pyrites, \$1,066,575; natural gas, \$3,182,154; salt, \$1,095,866. Nearly one-half of the mining wealth of Canada is produced in Ontario.

Climate.—The climate is inclined to the extremes of heat and cold during summer and winter respectively, but owing to the dryness of the atmosphere it is always healthful and bracing. Extreme cold is felt only in the northern part, the vicinity of the Great Lakes in the south greatly modifying the extremes of temperature. The average temperature for January in the south is 21°, minimum 10° below zero; the average for July is 68°, maximum 90°, but rare, the ordinary maximum being 80°.

Agriculture.—Farming is an important occupation, especially in the south, where soils of black loam with clay and sandy varieties are of excellent quality and highly productive. The richest, most thickly settled and most highly cultivated portion of the province is the peninsula between the Ottawa River and Lakes Ontario, Erie and Huron. Until within a few years northern Ontario or "New Ontario" as it is sometimes called, comprising the part of the province lying north of the French River, Lake Nipissing and the Mathawan River was considered unsuited for farming and left to the lumberman, the trapper and later to the seekers after its great mineral wealth. However, it has been demonstrated that in addition to its forests and its mines, this great section, embracing 141,000 square miles, possesses thousands of acres of farm land as fertile as any in the province. The "Great Clay Belt," extending 350 miles from Lake Abitibi to Lake Nipigon, contains 20,000,000 acres admirably adapted for wheat-growing and is tapped by the Temiskaming and Northern Ontario, the Algoma and Hudson Bay, the Canadian Northern and the Transcontinental railways. Other fertile sections are the Rainy River Valley in the west, with 750,000 acres, an important area at the head of Lake Temiskaming, with more than a million acres, and the valley of the Wabigoon River, with 384,000 acres. The crops raised are chiefly wheat, barley, oats, Indian corn, potatoes and some tobacco and the fruit-growing farms of some districts yield a plentiful crop of apples, plums, pears, peaches and grapes. In 1916 there were 1,466,000 bushels of spring wheat raised and 16,465,000 of fall wheat; 7,498,000 bushels of barley, 50,771,000 bushels of oats and 18,113,000 bushels

of potatoes. The total value of field crops was \$190,646,000. Stock-raising, dairy farming and bee culture are among comparatively recent industries of the province which have been attended with encouraging results, largely due to the easy accessibility of markets by rail, supplemented by the lake, river and canal navigation. Ontario has 4,666,753 livestock; horses, 887,246; milch cows, 1,082,119; other cattle, 865,847; sheep, 595,477; swine, 1,236,954. Average value of occupied farm land (1916) was \$52.59 per acre. The southwestern peninsula of the province, lying between Lake Erie and Georgian Bay, rivals the Annapolis Valley in Nova Scotia in the production of apples, while peaches, pears, plums and the finest varieties of grapes grow to perfection in the southern counties. Peaches and grapes are most extensively grown in the district between Niagara and Hamilton. The problems affecting agricultural life in Ontario as elsewhere are not few. The loneliness of farm life, the scarcity of labor, the decreasing population of rural districts owing to the lure of the West are obvious problems, although they do not seem to impoverish the individual farmer or prevent increased production and rising profits. In the 10 years (1901-10) the rural population fell from 1,246,969 to 1,194,785 and the urban increased from 935,798 to 1,328,489. In New Ontario the problems were forest fires, inevitable transportation needs, the pioneer difficulties of clearing the land, etc. But these are trivial considerations in the general growth of the province and they are met by the encouragement of immigration and the sympathetic treatment by the government of questions as they developed.

Manufactures and Commerce.—The manufactures are numerous, chiefly owing to the favorable position which the province occupies with regard to water power, although steam power has been introduced to a large extent, coal being obtained without difficulty by means of the lakes from Pennsylvania and in smaller quantities from Nova Scotia. Chief among the supplies of water power are the falls on the Ottawa River and rapids of the Saint Lawrence, while the works on the Ontario side of the Niagara Falls by the Ontario Hydro-Electric Power Commission and others will give the province the most extensive water power works in the world. Up to date 100 municipalities derive electrical power from the water systems of the Commission, their high and low tension lines extending in the province for 1,400 miles. The principal manufactures are lumber and its by-products, agricultural implements, iron and woodware, wagons and carriages, railway rolling-stock (including locomotives), cottons and woollens, leather, furniture, flax, ordinary iron and hardware, paper, soap, etc. The value of the export in 1916 of manufactured goods, agricultural products, animals and their products, timber, minerals, etc., was \$482,000,000 and of imports \$499,606,959. The fisheries were valued at \$3,341,182.

Railways, Canals and Shipping.—Ontario has a perfect network of railways, nearly 12,000 miles, which has proved of great advantage in the development of the manufacturing and agricultural industries. In summer it is supplemented by the means of transport provided

SCALE OF MILES

by the lakes and by a magnificent system of canals. The principal canals are the Sault Sainte Marie Canal and the Welland Canal now under reconstruction, the latter 27 miles long, east of and parallel to the Niagara River, connecting Lakes Erie and Ontario.

Government.—The provincial government is administered by a lieutenant-governor appointed by the governor-general-in-council for five years, assisted by a responsible ministry. There is only one chamber, the legislative assembly, elected by ballot for four years, with 111 members, by the apportionment of 1914. By the redistribution of 1914 the province has 24 Senators and 82 Representatives in the Dominion Parliament. The government's policy is to encourage the development of provincial resources, and this may be said to be also the opposition party's policy. The revenue of Ontario is made up of subsidies and contributions from the Dominion treasury and from parol land and lumber sales, licenses, stamps, etc. The government receipts total nearly \$14,000,000. The municipal system is one of the most perfect in the world and affords a pattern followed in many other countries. Liquor prohibition is enforced.

Population.—The total population in 1911 was 2,523,294, as compared with 2,182,947 in 1901, showing an increase of 15.58 per cent. The majority of the population is of English descent, Scotch, however, predominating in Bruce, Grey and Glengary counties; Irish, German and other nationalities are found around Toronto. There are about 26,000 Indians.

Education.—The school system of Ontario is admirable and is under the control of a minister of education, who is always a member of the provincial cabinet. The schools are supported by a tax on property, with state grants, and are free to all. They include kindergartens, public schools and high schools or collegiate institutions. Roman Catholics may, and do, establish separate schools and are then exempted from supporting the public schools and receive a separate grant from the government. There are schools for Indian children, normal schools, normal colleges, country model schools, art schools and 395 free libraries under the care of the board of education and there are a number of traveling libraries. Ontario has 6,660 elementary and secondary schools, employing 120,801 teachers and having an enrolment of 508,522 pupils. There are in addition 161 high schools and 132 continuation schools. Ontario has 539 Roman Catholic and 5 Protestant separate public schools. For public and separate schools the province now spends over \$13,000,000 annually. At the head of the educational systems stands Toronto University (q.v.) at Kingston and Victoria, Trinity, etc.; affiliated with Toronto University.

Religion.—There is no state religion. The Methodist, Presbyterian, Church of England, Roman Catholic and Baptist are the strongest numerically of the religious denominations.

History.—Ontario as part of Quebec was hunted over by the French after its exploration by Champlain in 1615 and was visited by Jesuit missionaries to the Indians. The French occupation was not a source of much settlement but was marked by wars with the Iroquois Indians or Five Nations, in which the Huron

allies of the French were almost totally annihilated. In 1763, with Quebec and the Atlantic provinces, Ontario, passed into the hands of Great Britain, which organized the province of Ontario in 1774 and in 1791 divided it into Upper and Lower Canada. At the close of the American Revolution in 1783 Ontario received a notable immigration of United Empire Loyalists from the United States who were the actual founders of the province. Upper and Lower Canada were reunited in 1841 and again separated when the Dominion of Canada was organized in 1867, the western province becoming the province of Ontario. Besides these, the chief incidents of its history were several battles and invasions of the War of 1812, notably those of the Thames, Lundy's Lane and Queenston Heights; the evolution of full responsible government and British institutions; the unsuccessful uprising of 1837 directed against certain local causes of complaint and rule and not against Great Britain; the Fenian Raids of 1866 from the United States; the great prosperity of the Crimean War and reciprocity period of 1854-66; the industrial and agricultural growth of 1880-1918.

D. S. DOUGLAS,

Editorial Staff of The Americana, Toronto.

ONTARIO, Lake, North America, the smallest and easternmost of the five Great Lakes in the Saint Lawrence Basin, forming a portion of the boundary between and partly belonging to the United States and partly to the Dominion of Canada. It is of elongated, oval shape, 193 miles long, with a maximum central breadth of 60 miles, a circumference of about 480 miles, an area of 7,260 square miles and a drainage area of 28,840 square miles. Its surface level is 326 feet below that of Lake Erie (see article NIAGARA FRONTIER) and 246 feet above the tide level of the Saint Lawrence. Its depth is said to average 490 feet; the greatest depth is 738 feet and it is navigable throughout its whole extent for vessels of the largest size. It receives the waters of Lake Erie through the Niagara River (q.v.) with its phenomenal falls and gorge on the southwest and discharges at its northeast extremity through the Lake of a Thousand Isles, by the Saint Lawrence (q.v.). It also receives numerous rivers, including the Trent and Humber on its north and the Black, Genesee and Oswego from its southern shores. Lake Ontario has many good harbors; and as it never freezes, except at the sides, where the water is shallow, its navigation is not so much interrupted like that of Lake Erie. It is, however, subject to violent storms and heavy swells. It communicates by the Genesee River and Oswego Canal with the Erie Canal, and, consequently, with the Hudson River and New York City; the Niagara River and the Welland Canal, in the southwest, unite it with Lake Erie and the Rideau Canal connects it with the Ottawa at Ottawa city. Toronto, Kingston, Port Hope, Cobourg and Hamilton are the principal towns on the British side; and Oswego, Genesee, Sackett Harbor and Charlotte on the American bank. It was discovered by Etienne Brûlé in 1611 and was first explored by Champlain in 1615.

ONTARIO AGRICULTURAL COLLEGE, The. This institution, located at Guelph, Canada, was founded in the year 1874

with a staff of six officers and it was opened in the same year with an attendance of 28 students. For four years the school struggled on, first under one principal and then under another, until in 1879 Dr. James Mills was appointed to the presidency and a period of ever-increasing popularity and usefulness for the institution set in. From that time the college has grown steadily in equipment, attendance and popularity and it now embraces a plant worth nearly \$2,000,000, with well-equipped departments of animal and field husbandry, veterinary science, horticulture, dairying, domestic science and nature study, a full set of large and substantial farm buildings, a farm of 550 acres, residences for both male and female students and first-class laboratories for chemistry, physics, biology and bacteriology, provided with apparatus for student instruction and for scientific research work and an efficient staff of 75 instructors and officers. The institution provides courses in all departments of agriculture, in nature study and domestic science. The enrollment which has been adversely affected by the Great War was 1,184 in 1914-15.

ONTOGENY, in biology, the individual development of an organized being, as distinguished from phylogeny or race evolution. These terms were first introduced as divisions of "biogenesis," but are now in common use in biology. The most interesting phase of ontogeny is the sort of parallel between the development of an individual, especially in the embryonic stages and the steps of development taken by the race to which it belongs.

ONTOLOGICAL ARGUMENT, the argument, due to Saint Anselm, to the effect that God exists, because the idea of God is that of an absolutely perfect being, which must therefore have the crowning perfection of existence. Modified forms of the ontological argument were used by Descartes and by Leibnitz. One form of the argument which is used by Descartes reads as follows: the result must have more reality than the cause and so our idea of the most perfect being can only result from this being itself, as the only thing in the universe that is more real. See METAPHYSICS; ONTOLOGY.

ONTOLOGY (Greek *ὄντο* being; and *λογία* account, science), the science of being, that is, metaphysics. Aristotle did not employ the word, but called this branch of science the "First Philosophy," defining it as the science of being, of that which exists, as far as it may be said to exist (*ἐπιστήμη τοῦ ὄντος*), that is in fact, the science of the essence of things; of things, not with regard to their accidents, qualities, physical or mathematical, but merely as being; the world being including not only whatever actually is, but whatever can be. The word ontology was first introduced into philosophy by Christian Freiherr von Wolff. He divided metaphysics into four parts; ontology, psychology, rational cosmology and theology. Kant denied that one can have any knowledge of existences, but only of appearances or phenomena. He believed that there was a rational science of principles and causes of the principles of being and knowing, and his system of metaphysics was merely an exposition of this rational ontology. Rational ontol-

ogy may be treated in two different ways according as we postulate one existence or many. If there is one existence, all phenomena are but modifications of this. This reduces metaphysics to the science of the one substance or existence, the Absolute. If many existences or causes be postulated, several co-ordinate branches of inquiry are opened up. See METAPHYSICS; PHILOSOPHY; TELEOLOGY.

ONYX (Greek, "finger-nail," "veined gem"), a hard variety of agate, and hence a sub-variety of chalcidonic quartz, with layers, usually curvilinear, of white, alternating with red (sardonyx), gray (chalcedony), black (onico), or green or brown. Mexican onyx is actually calcite or aragonite (q.v.) and is softer than the real onyx. The true ancient onyx was much prized as a gem and particularly in making cameos. Most modern onyx, so-called, is artificially colored; Algerian onyx, for instance, being only a variety of calcite. Apart from its use in jewelry, onyx has long been used in architecture, for table-tops, columns, and, in part or entire, stair-cases, being often used with white marble. Many onyx pillars quarried in Roman times are now used in Arab mosques; and in more distinctly Occidental buildings it is sometimes used, as in the stairway of the Opéra at Paris.

ONYX MARBLE, a banded variety of marble of translucent, whitish and sometimes iridescent appearance, resembling onyx. It is a variety of carbonate of lime, its coloring being due to deposits of iron or manganese. The Romans called it *alabastrites* and it is frequently termed "Oriental alabaster," although it is a carbonate instead of a sulphate of lime. It is of both travertine and stalagmitic formation, the former being finer and handsomer. The Egyptian quarries were lost for many centuries but were rediscovered about 1850 and furnish a fine quality of the stone. The chief source of supply is Algeria, where the output is of great beauty and the deposits of large extent. A considerable supply comes from Mexico and is known as Mexican onyx or Tecalli marble. There are other deposits reported in southwestern United States but these have not as yet been developed. The stone is largely used for making vases, table tops, clocks and similar articles, while in ancient times it was highly prized for making receptacles for precious ointments.

OOLACHAN, ōo'la-kān, **EULACHON** or **OULACHON**. See CANDLE-FISH.

OOLITE ō'ō-lēt (Greek, "egg-stone," so called from its resemblance in size and shape to the roe of a fish), in geology, any minute concretionary grain or spherule, usually formed about a bit of sand or the body of a minute foraminifer. These concretions are often calcareous, and make up thick beds of limestone. Silicious oolites, or oolitic cherts, are also abundant, and much of the iron ore of the Clinton Epoch of the Silurian is oolitic. This oolitic iron ore is known in Wisconsin, New York and the Birmingham district of Alabama. Oolites, both calcareous and ferruginous, are known to form on the bottoms of modern lakes, at various localities. They are said to be in process of formation on the Florida banks. What may be called the Oolitic Period was marked by

frequent precipitations of muddy sediment (calcareous or ferruginous) which killed and enclosed many minute organisms. This period is the later part of the Jurassic; and in England oolitic limestones are so frequent and so typical of the Upper Jurassic that the Jurassic is often divided by English geologists into the Liassic Group and the Oolitic Group, and the latter subdivided into the Lower or Bath Oolite, the Middle or Oxford Oolite, and the Upper or Portland Oolite.

OOLOGY, ō-ōl'ō-jī, the collecting of birds' eggs has always possessed a peculiar fascination for some men, and in the attempt to claim for their pursuit a legitimate place in scientific work they have coined for it the term Oology. A famous naturalist once said that when the oologist prepared his specimens he blew all the science out through the hole in the shell, and there is much truth in the statement. The benefit that ornithology gains from the study of a cabinet full of empty egg-shells is so slight that it is not worth the sacrifice of bird-life that the collecting entails. While the relationship between certain groups of birds is indicated in the character of their eggs, as, for instance, between the shore-birds and the gulls and terns, nevertheless the variability, in size, shape and color is so great, within many groups, that it is impossible to form any systematic arrangement from a study of eggs alone, and it is only now and then in connection with other characters that they prove of assistance in defining a natural arrangement of birds. The significance of their shape, colors, etc., is discussed under Egg.

In collecting eggs for scientific purposes the greatest care should be exercised in positively identifying the bird to which they belong, without which data they are absolutely worthless. The nest, which is quite as important as the eggs, should also be preserved with great care, keeping it *in situ*, if possible, and all details of its location, the date of the collecting, etc., should be recorded. The method of preparing egg-shells for the cabinet is explained in many books, and many instruments have been devised for the purpose. Suffice it to say that a round hole should be drilled with an egg-drill on one side of the egg, the size depending upon the degree of advance in incubation, and the contents should be removed by the use of a fine-pointed blow-pipe. Jets of water may be used effectively to aid in emptying the shell, and should be used in washing it out, while various chemical solvents may be of assistance in dissolving well-formed embryos. Every egg-shell should bear a number corresponding to its record. Directions for the collection, preservation and care of birds' eggs are published by the Smithsonian Institution.

Probably the finest illustrated work on the oology of any region is Bendire, 'Life Histories of the Birds of North America' (1892; unfinished). Other works are Bädcker, 'Die Eier der Europäischen Vögel' (1863); Des Murs, 'Traité général d'Oologie Ornithologique' (1860); Davie, 'Nests and Eggs of North American Birds' (5th ed., Columbus 1898); Gentry, G., 'Nests and Eggs of the Birds of the United States' (Philadelphia 1885); Hewitson, 'Eggs of British Birds' (1856); Lefevre, 'Atlas des Œufs des Oiseaux d'Europe' (1845);

Newton, 'Dictionary of Birds' (New York 1893-96).

OOMS, ōmz, Karel, Belgian painter: b. Desschel, province of Antwerp, 27 Jan. 1845; d. 20 March 1900. He was educated at the Antwerp Academy and under Nicaise de Keyser, later traveling in England, Germany and Italy. He chose historical subjects in the main. Among his works are 'Philip II Paying Last Honors to Don Juan of Austria' (Antwerp Museum); 'The Death of the Duke of Alba'; and many others, some of which are in the Palais de Justice and in the Brussels Museum.

OORIAL, oo'ri-ēl, **URIAL**, or **SHA**, a large wild sheep (*ovis vignei*) inhabiting the high Himalayas and Tibetan plateaus and eastward to Persia, the chase of which calls for the greatest endurance, skill and resolution on the part of the hunters. The rams have immense, rounded, coiling horns; and while both sexes vary much in color, they agree in the habit of wandering widely. Consult Blanford, W. T., 'Fauna of British India' (London 1889).

OOTACAMUND, ūt'a-ka-münd', or **UTAKAMAND**, British India, hilltown resort and headquarters of the Nilgiris district in Madras, and summer headquarters of the Madras government, 55 miles northeast of Calicut, reached by a rack railway from the Mettapolliem station on the Madras Railway. The town is situated on a plateau 7,230 feet above sea-level and is surrounded by hills. The principal sanatorium of Southern India is located here and there are government botanical gardens and a government cinchona plant. The mean annual temperature is 58° and the rainfall 49 inches. The place is notable for its beautiful private gardens and its fine drives. There are extensive plantations of coffee, tea, cinchona and eucalyptus, two dairy farms, and manufactories of beer and soda water. There are excellent churches, the Lawrence Asylum for the children of European soldiers, the Brecks Memorial and Basel Mission high schools, a public library and fine athletic grounds. Pop. 18,829.

OOZE, fine sticky mud, almost entirely of organic origin, covering great parts of the sea-floor, and constituting one of the most important of the ocean deposits. The various oozes are made up mostly of the remains of various foraminifers, and hence furnish a valuable means for the study of deep-sea microorganisms, even apart from their rôle in the building up of ocean beds. According as one variety or another of organic remains predominates or occurs characteristically, the oozes are usually classified as Globigerina ooze, Pteropod ooze, Diatom ooze and Radiolarian ooze. But it must be borne in mind that no one ooze consists entirely of any one sort of the foraminifers mentioned. The division mentioned is, moreover, logically a secondary division, since we may speak of the calcareous oozes (including the Globigerina and the Pteropod) and the silicious (including the Radiolarian and Diatom oozes), a more suggestive classification, though still one that is based only on predominant characteristics, since the Globigerina ooze, for example, is never free from silicious organisms. Murray says that the silicious element even here varies from "traces" to 20 per cent. But the Globigerina ooze usually averages 40

per cent of carbonate of lime, sometimes reaching 95 per cent, and its most characteristic component is the foraminifer *Globigerina*, besides which it contains other pelagic *Foraminifera*, as *Pulvinulina*, *Orbulina*, etc. The predominant color is pale gray, with occasional red and brown tints due to the peroxides of iron or manganese. The *Globigerina* ooze occurs near the equator both in the Atlantic and Pacific and in the western and southern Pacific; a special variety of it marked by the presence of comparatively fewer rhizopods and more pteropods and heteropods, though these latter shells never predominate, is found in tropic depths of less than 2,000 fathoms, near the Fiji Islands and elsewhere in the western Pacific, and is called pteropod ooze. *Radiolaria* occur both in the *Globigerina* ooze and in the Diatom ooze, but where they predominate the ooze is named from them; a great strip of this silicious mud spreads between 15° N. and 10° S. to 140° E. and 150° W. in the Pacific. The color is reddish and brownish because of the presence of manganese and iron; the composition otherwise is mainly silicious, though as much as 20 per cent of carbonate of lime may occur. The other silicious variety is marked by the presence and predominance of Diatoms, with occasionally 25 per cent of *Globigerina* shells and other calcareous matter. Its color is that of pale straw and, when dried, dirty white. These various classes merge into each other on the ocean bottom, and there is no hard and fast line between them. Their deposit has been slow and continuous and apparently not such as to affect continental areas, or even, markedly sea depths. Consult Murray, 'Challenger Reports—Deep Sea Deposits' (1891). See *GLOBIGERINA*.

OPACITE, in mineralogy, black opaque grains or scales, usually of minute size, found most commonly with magnetite. They are incapable of microscopic identification and seem to vary in composition, some being graphitic, and others metallic oxides or silicates.

OPAH, KING-FISH, or SUN-FISH, a large and beautiful sea-fish (*Lampris luna*), a native of the Eastern seas, but found in the Atlantic and Arctic oceans, and, rarely, on the North American coasts. It is about four and one-half to six feet long and weighs 140 to 500 pounds. Its colors are very rich, the upper part of the back and sides being green, reflecting both purple and gold, and passing into yellowish-green below, the fins bright vermillion. The body is oval and laterally compressed, and the scales are small. It has a single dorsal fin and a forked tail. It is believed to feed on cuttlefish and similar animals. The flesh is highly esteemed.

OPAL, hydrated amorphous silica, used as a gem-stone even in ancient times, when it was supposed to have magical virtues, as of making its possessor invisible if he carried it wrapped in a bay leaf, or of making him generally beloved so long as he trusts in its virtues. From the point of view of the mineralogist the opal is remarkable as never occurring in crystal form and as differing from quartz only in having 3 to 13 per cent of water in its composition. Its fracture is conchoidal, and occasionally very perfect; its lustre vitreous, pearly or sometimes resinous; its color variable, white, red, yellow, green, gray and blue

occurring; its density 1.9 to 2.3 and its hardness 5.5, that is, less than quartz; it is perfectly soluble in hot caustic potash, another dissimilarity between it and quartz; and it is infusible by the blow-pipe. The principal varieties of the opal are: the *precious opal*, with splendid coloration due to fine fissures, varying from translucent to transparent, and occurring, especially, near Czarwenitz, Hungary, and in Australia, in conglomerate, basalt or porphyry. Its color varies with climate and temperature and sometimes disappears permanently, the opal then being called "dead." The stone is not cut, being too brittle, but is set *en cabochon*. The variety usually called Mexican is actually a sub-variety of the precious opal, occurs in Guatemala, the Faroe Islands and in southern Australia, and should not be confused with the *fire opal*, which is the commonest opal of Mexican provenance, occurring there at Zunapan, and in Washington County, Ga., as well as in the Faroe Islands. It is a hyacinth red. The *girasol* is a Mexican and Central American variety with bluish tinge and red reflections. The *common opal* is widely distributed, has a great range of colors like the more valuable varieties and differs from them in having neither reflections nor color-play; it is found at Leisnig, Saxony, at Kosemitz, Silesia, at Dubnik, Hungary, in the Faroe Islands, in Iceland, and in America at Cornwall, Pa., Idaho Springs, Colo., and Calaveras, Cal. *Semi-opal* is more opaque than common opal, with which it often occurs, as well as in company with chalcedony; it sometimes is considered to include *wood-opal*, which resembles petrified wood in its origin, but has the peculiar marking of the opal. A forest of opal ized wood was discovered in Montana in 1903. Inferior varieties are *hydrophane*, which is transparent only in water; *mother-of-pearl opal*, used, especially when found with chalcedony, for cameos; *glass-opal* or *hyalite*, made up of glassy concretions; and *melinite*, a gray, tuberosous or reniform mass.

OPATA (ō'pā-tā) INDIANS, a tribe of American Indians living in the centre and east of the Mexican state of Sonora. They have long been Christianized, are a quiet and industrious people, and are devoted to agriculture. They are domiciled in villages. This mode of life has given them a fairer complexion than that of the Indians who dwell entirely in the open air. They are the only Indians who have successfully contended with the savage Apaches. On many occasions they have aided the Mexican government in fighting other tribes. Shortly after the Spanish conquest of the domains of the Montezumas, the Opatas were found well clothed and living in prosperous villages. Their headquarters were along the banks of the Sonora and Oposura rivers and especially in the vicinity of Arispe and Nacarsara mining regions. In early days they occupied the whole western slope of the sierra from the headquarters of the Sonora River to Muri, near the Yaqui towns. They built of wood, adobe and loose stones, in the colder regions, and of reeds and palm leaves in the lower, better, larger and more comfortable houses than most of the neighboring tribes. They carried on an extensive trade in placer gold, pearls, turquoises, coral, emeralds and

other valuable stones and they were good agriculturists. After the coming of the Spaniards they became herdsmen and possessed large flocks of cattle, goats, sheep and horses. They are excellent workers, make good soldiers, and take readily to the ways of civilization.

OPDYCKE, ɔp'dik, **Emerson**, American soldier: b. Hubbard, Ohio, 7 Jan. 1830; d. New York, 25 April 1884. He enlisted in the Federal army in July 1861 and was commissioned first lieutenant in the 41st Ohio regiment. He participated in the battle of Shiloh, and in 1863 was commissioned colonel. He lost more than a third of his regiment, the 125th Ohio, at Chickamauga, and later saw service at Missionary Ridge, Rocky-face Ridge and Resaca. He was in command of a brigade from August 1864, and in 1865 became brigadier-general of volunteers. He rendered important service at the battle of Franklin and at Nashville. He commanded a brigade in Texas at the time of his resignation in 1866, when he was brevetted major-general of volunteers, the commission dating from the battle of Franklin. He was subsequently engaged in business in New York.

OPECHANCANO, ɔ-pěch-an-kā'nō, an American Indian chief of the Powhatan confederacy of Virginia: b. about 1545; d. 1644. He was a brother of the famous Indian leader Powhatan, father of Pocahontas. He it was who captured Captain John Smith and turned him over to Powhatan. After the latter's death he became the head of the Powhatan confederacy in 1618, though his elder brother Opitchapan was then nominal head chief. Under cover of being friendly to the English he united all the tidewater tribes in Virginia, and 22 March 1622 an attack was made on the colonists (at Jamestown). Over 400 men, women and children were massacred. After a long term of intermittent peace, Opechancano again attacked the English in 1644 and 300 persons were put to death. The chief was afterward captured and was shot at Jamestown by a sentry appointed to guard him.

OPELIKA, ɔp-ē-lī'ka, Ala., city, county-seat of Lee County, on the Central of Georgia and Western of Alabama railways, about 60 miles in direct line west by north of Montgomery. It was settled in 1839 or 1840. It is in an agricultural region in which cotton is one of the chief products. The principal manufactures are cotton products, brick, fertilizers, flour and lumber. It has considerable trade in its manufactures and the farm products of the surrounding region. Pop. about 5,000.

OPELOUSAS, ɔp-ē-loo'sas, La., town, county-seat of Saint Landry County, on the Bayou Teche, and on the New Orleans, Texas and Mexico, Morgan's Louisiana and Texas and Texas and Pacific railroads, 55 miles west of Baton Rouge. It is the trade centre of a cotton, rice and livestock raising district, and contains a cotton compress and a cottonseed-oil mill. It has a high school and the Academy of the Immaculate Conception (Roman Catholic). Pop. (1920) 4,437.

OPEN-BILL, an African bird (*Anastomus lamelligerus*) of the stork family, so named from the odd formation of the beak, which at the anterior end exhibits a gap between the

mandibles. Another species (*A. oscitans*) inhabits the East Indies. The beak is yellow, and the general plumage black with dashes or suggestions of green and purple throughout. The open-bills are also called shell-storks or shell-ibises on account of their ordinary food, which consists of mollusks.

OPEN DOOR, The, a term of diplomatic significance applied to the unrestricted maintenance of international commercial relations. It came into general use in the 19th century in regard to conditions in Eastern Asia and indicates an arrangement binding by general consent rather than by treaty, whereby all nations are allowed to trade in China and its dependencies upon equal terms. The European Powers controlling spheres of influence in the Chinese Republic tacitly admit foreign traders into their spheres on the same conditions as traders of their own country. This agreement, so far as the United States and other Powers are concerned, places China, commercially, in the same relation to the rest of the world that she had before the spheres of influence were recognized. Her tariff rates are to be uniform to all nations with which she enjoys trade treaties. The Powers, on their side, agree to respect existing treaties, a condition of considerable importance to the expansion of commerce in that of the United States in particular. See articles on TREATY PORTS; FREE TRADE; TRADE; TARIFF.

OPEQUON, ɔ-pěk'an, **Battle of the** (also called the Battle of Winchester), where General Sheridan, 19 Sept. 1864 defeated the Confederates under General Early. On the night of 18 Sept. 1864 General Early had Ramseur's division and Nelson's artillery in position about one and one-half miles east of Winchester, Va., across the Berryville road, along an elevated plateau between Abraham's Creek on the south and Red Bud Run on the north. Rodes' and Wharton's divisions, with Braxton's and King's batteries were at Stephenson's Depot and Gordon's division at Bunker Hill, under orders to join Rodes and Wharton by sunrise next morning. Cavalry picketed the Opequon and the roads northward and westward on the left and on the right along the Millwood and Front Royal roads to the Shenandoah. Early had about 15,000 men. General Sheridan, with about 38,000 cavalry and infantry, was at Berryville, east of the Opequon. He had ordered a movement south of Winchester to Newtown, but when he heard that parts of Early's army were at Bunker Hill and Stephenson's Depot ordered a direct attack on Winchester. Wilson's cavalry division, followed by the Sixth and Nineteenth corps, was to move on the Berryville road, while Torbert, with Merritt's cavalry division, moved to Stephenson's Depot, to join Averell's cavalry division, which was to move up from Darksville. Crook's Eighth corps was to be in reserve at the crossing of the Opequon. Early on the morning of 19 September Wilson was on the road, crossed the Opequon and cleared the way for the infantry. The Sixth corps came up and, under a heavy artillery fire, formed a line in front of Ramseur, its batteries replying to those of the Confederates. Wilson formed on the left of the Sixth corps. It was nearly noon before Grover's division of the Nineteenth corps was

formed on the right of the Sixth, with Dwight's division in reserve. Meanwhile Early had concentrated his army. When Wilson drove in his cavalry pickets on the Opequon at daylight and the Union movement developed itself, he ordered Gordon and Rodes from Stephenson's Depot and both arrived before the Union lines were formed and took position on Ramseur's left, under cover of a piece of woods, Gordon being on the left of Rodes, who had three brigades. At near noon the Union line moved forward; Nelson's artillery on the Confederate right and Braxton's on the left opened a destructive fire; Early ordered Rodes and Gordon to advance from the woods and attack the Union right; and the two lines met in a deadly struggle. Ramseur and Rodes were driven steadily back by the Sixth corps and Grover's division of the Nineteenth struck Gordon's left, held by Evans' brigade and drove it back in disorder through the woods from behind which it had advanced. Grover followed to the very rear of the woods and to within musket-range of Braxton's artillery, which was without support; but Braxton's guns stood to their ground and opened with canister, which checked Grover's advance. At this moment Battle's brigade of Rodes' division came up, moved forward through the woods and striking a weak point in the Union line, where the right of the Sixth corps joined the left of the Nineteenth and joined by the rallied brigades of Rodes' and Gordon's divisions, drove back Ricketts' division of the Sixth corps and Grover's of the Nineteenth and caused the remainder of the deployed line of the Sixth corps to fall back to the ravine from which it had advanced. But while the Confederates were pursuing Grover, Russell's division of the Sixth corps, which was in second line, charged forward to fill the gap made by the withdrawal of Ricketts and struck the Confederates in flank, driving them back with heavy loss. The Union line was re-established and there was a comparative lull in the engagement, which had been very bloody. General Rodes, one of Early's best division commanders, and General Russell, one of Sheridan's best, had been killed. Crook's Eighth corps, which had been intended to be used on the left to seize the Valley pike south of Winchester, was now brought to the right and its two divisions, forming on the right of the Nineteenth corps, charged and broke Gordon's division. Meanwhile Wilson's cavalry on the left had driven Lomax's cavalry back toward the Valley pike. On the right Merritt's cavalry division, after severe skirmishing, had crossed the Opequon at three fords near the railroad crossing, but was quickly held in check by Wharton's division of infantry and King's battery, which had advanced from Stephenson's Depot to meet it. A severe contest ensued, lasting some hours, both sides gaining and losing ground; but Averell, moving up the pike from Darksville to Stephenson's, driving two cavalry brigades before him, came into the rear of Wharton, while he was engaging Merritt, causing him to abandon his position and fall back at 2 p.m. to Winchester, where two of his brigades were put in reserve, in rear of Rodes' division, one remaining to support the cavalry north of the town. Merritt now advanced and joined Averell and both moved down on Early's left, driving back

the Confederate cavalry, until Merritt joined the right of Crook's troops. Averell and Merritt swung around to the rear of Early's left, driving his cavalry through the infantry lines and compelling him to send two of Wharton's brigades to check them. Crook, who had driven Gordon, now advanced on Wharton's flank and was himself struck by a flank fire. Early was now obliged to yield ground. The Sixth and Nineteenth corps were steadily driving Ramseur's and Rodes' divisions back to Winchester. Averell's and Merritt's cavalry divisions were charging around his left flank, forcing back his cavalry in some confusion and attacking his infantry. Many prisoners were taken from both. Finally, after an unsuccessful effort to hold an intrenched position covering the town, his road to Newtown being threatened, the whole line gave way and retreated, near sundown, some of it in confusion and disorder, some of it in an orderly manner, followed by Sheridan's cavalry to Kernstown, where Ramseur, who was rear-guard, checked pursuit at dark. Early halted at Newtown at midnight and next morning continued his retreat through Strasburg to Fisher's Hill, Sheridan following to Cedar Creek. The Union loss at the battle of the Opequon was 697 killed, 3,983 wounded and 338 missing, an aggregate of 5,018. The Confederates lost 276 killed, 1,827 wounded and 1,818 missing, an aggregate of 3,921. They lost also five guns and nine colors. Consult 'Official Records' (Vol. XLIII); Pond, 'The Shenandoah Valley in 1864'; Sheridan, 'Personal Memoirs' (Vol. II); Early, 'A Memoir of the Last Year of the War for Independence'; The Century Company's 'Battles and Leaders of the Civil War' (Vol. IV).

E. A. CARMAN.

OPERA. A drama set to music and sung with orchestral accompaniment. For all practical purposes, the history of opera begins at the close of the 16th century, with the activities of a small group of dilettanti, men of letters and musicians, who met at Florence under the influence of the Renaissance movement and attempted to revive the lost art of musical declamation as practised by the Greeks. Up to this time musical art had concerned itself almost exclusively with ecclesiastical music and under the wing of the Church it had led a cloistered existence, aloof from the daily life of the people. The brilliant and aristocratic coterie who met at the palace of Count Bardi were not interested in the democratization of the art of music, but they were nevertheless largely influential in bringing it about. Their eyes were turned to the past, not to the future. Their attempt to restore what was forever gone was foredoomed; but the failure was not an inglorious one, since it gave the impetus to a great forward movement, the development of the entire range of secular music, of which the opera formed a part. Turning their back on existing musical theories and devices, these Florentines experimented with a declamation which was designed to follow the vocal inflections of speech under emotional stress. The result was monotonous and halting and interesting only to the historian; but it contained the germs of modern dramatic music and revealed, for the first time, the possibilities of instrumental music distinct from and inde-

pendent of vocal music, to which it had heretofore always been the handmaid.

It would be erroneous to assume, as it frequently is, that opera sprang fully grown from the heads of this Florentine group. Recent research has shown that the true beginnings are found in the "Sacre Rappresentazioni," scenic representations of religious themes (not unlike the English mystery plays), which dated back to the first part of the 14th century and in which the music was closely associated with dramatic action. But the conscious application of musical declamation to the drama seemed to give to the latter a new outlook and impulse. So that if the Florentine group are to be denied the glory of having really created a new art form (and their sincere belief in the originality of their efforts is unquestioned) they are entitled at least to the credit of being the most effective instruments in turning the course of musical development in an entirely new, significant and fruitful direction.

The work which is generally accorded the distinction of being the first opera in 'Euridic.' produced at Florence in the year 1600, of which the poem was written by Ottavio Rinuccini and the music by Giacompo Peri, both members of the group referred to; and before the close of the same year another setting of the same poem by another of the group, Giulio Caccini, also saw the light. It is a striking coincidence that the year 1600 witnessed the birth of oratorio as well. See ORATORIO.

It was only a short time before the attention of the trained professional musicians was attracted to the "new music" as it was called. The first of these was Monteverde (1567-1643) who, thoroughly grounded in the traditions of the ecclesiastical school, had, to a marked degree, the vision of a creative genius combined with the spirit of a true explorer. His first opera, the poem by Rinuccini, was 'Arianna,' produced in 1607. Only a fragment is extant, but it contains signs of the revolution which musical art was undergoing. His next work, given the same year, was 'Orfeo' (based on the same story as Peri's opera), and this has fortunately been preserved in its entirety. It established Monteverde as the foremost dramatic composer of his day, a position which the judgment of posterity has unhesitatingly confirmed. In daring and imagination he ranks with the greatest musical geniuses. As an innovator he is entitled to be classed with Gluck and Wagner. With them he shared the condemnation of the more conservative musicians of the time, who objected to what they called his gross breaches of the strict rules of counterpoint and balked at his novel instrumental effects. He invented the use of Pizzicato passages and the tremolo for string instruments, which have become effective devices for dramatic expression. Under his imperious guidance, music took a step in the direction of uncompromising dramatic expression, which it has never retraced. Before the close of his life and not a little due to the success of his efforts in the new field, the first public opera-house was opened—in 1637—and soon they had spread all over Italy and beyond. Monteverde's mantle fell upon his pupil Cavalli (1599-1676), whose taste suggested the development of a more flowing melody as a contrast to the

continuing recitative, thus foreshadowing the aria form. Passing over an intermediate period, marked by brilliant names, the next significant stage was reached toward the end of the 17th century, the period of Alessandro Scarlatti (1659-1725). By this time the opera which had at first employed music simply as an added emphasis to dramatic emotional expression, had become primarily a musical form with dramatic accompaniment. The librettist was the servant of the composer. Even so great a poet as Metastasio (1698-1782), the most famous and successful of librettists, whose dramatic poems were set to music by every well-known dramatic composer of his own and the succeeding generation, was bound by musical, rather than dramatic conventions. And in that never-ceasing struggle for supremacy between the arts which has marked the course of operatic history the composer was, in his turn, becoming more and more the servant of the singer. In Scarlatti's day the art of tune-making was fully realized and for a long time the history of opera became the history of the aria and of the famous singers such as Caffarelli, Faustina, Cuzzoni, Farinelli, etc. Scarlatti combined learning with imagination and applied a big talent to the development of opera, which, at his hands, came to have a truly modern stamp. He used with discrimination three distinct forms of dramatic expression, the simple and primitive form of "dry recitative" (*recitativo secco*), the accompanied recitative (*recitativo stromento*) and the aria. He also developed into definite design the instrumental prelude or overture.

The first great name in French opera is that of Giovanni Battista Lulli (1633-87), a Florentine by birth, who was brought to France as a mere boy and soon forced his way to the very front, founding and dominating a school, the influence of which is still felt. In Germany, the leader among the early opera writers was Reinhard Keiser (1674-1739), who, though but a name to-day, forged an important link in the development of German dramatic music.

The reaction of opera on church music was by this time complete and the horizon of the composer in every field of music had become greatly extended by the almost universal interest in the lyric drama. Bach (1685-1750) is the one notable exception of a great composer not tempted to try his hand at opera, his sturdy, serenely balanced mind, keeping its attention entirely to the development of absolute and ecclesiastical music. There is no space for even brief mention of the long list of operatic composers of the 18th century, but the names of Handel (1685-1759) in Germany and England and Rameau (1683-1764) in France cannot be omitted. Handel's operas were genuine additions to the literature of stage music. Following Italian models, his genius contrived to give them an international quality. 'Rinaldo,' written and first produced in England in 1711, is now but a name, yet it was the greatest opera the world had, up to that time, seen.

Gluck's (1714-1787) career as an operatic power was coincident roughly with the third quarter of the 18th century. He bent his great talents to the task of bringing opera back to the straight path of artistic verity, from which it had strayed, and to restoring the balance

between the drama and the music. His greatest success was made in France, where his appearance caused a sensation unique in operatic annals. His principal operas, 'Alceste,' 'Orfeo' and 'Iphigénie en Tauride,' embodied the finest qualities of the Italian, French and German models and are lasting monuments to a great genius who was also an intellectual giant.

From Gluck to Mozart (1756-91) is not a long step chronologically, but artistically it is a transition from one period into an entirely different period, an age of symphonic development with its marked reaction on dramatic music. Gluck was an iconoclast and a reformer by instinct. Mozart, writing apparently without preconceived theories and along conventional lines, transfigured everything with his golden touch. His treatment of the ensembles which had become an important feature of the opera, highly organized and developed and of the orchestra as a flexible and responsive instrument for dramatic expression was far in advance of anything that had gone before. His three greatest operas, 'Don Giovanni,' 'Figaro' and 'Magic Flute' are still in the current repertoires in the leading opera houses of the world. Each is a masterpiece and they had a profound influence on all the musical stage works that have followed. Beethoven's (1770-1827) solitary opera, 'Fidelio,' fills a niche all its own, though it has been without much effect on the subsequent development of the lyric drama.

The 19th century saw the greatest extension of operatic activities. Weber (1786-1826), Wagner (1813-83) and Verdi (1813-1901) are the three highest mountain peaks in a long and imposing range. With Weber at the beginning of the century was developed the romantic opera, without which Wagner would not have been possible. 'Der Freischütz,' 'Euryanthe' and 'Oberon' are the earliest and the greatest works of this genre which has had a prolific progeny. Weber still employed the stereotyped form of operatic arias, but the horizon of dramatic expression had widened visibly. Orchestral effects designed purely to heighten the stage pictures are innumerable in his works. Weber discovered the unlimited possibilities of flexible musical speech which Wagner utilized so thoroughly. Wagner's announced intention was to create a new art form through the combination and organic union of music, poetry and the related arts of the theatre and in applying this theory to his own works he not only composed the music, but wrote the librettos and even designed the stage decorations. This fusion of the arts and the greatly enlarged mechanism of the operatic structure are Wagner's chief contributions to the opera as an art form. Verdi was no pathfinder, but he is the richest contributor to the 19th century literature of Italian opera, the history of which is in fact best summed up in his stage works from 'Oberto' to 'Falstaff,' his crowning gift to the operatic repertoire. The younger Italians, of whom Puccini is the leader, have added materially to operatic expression though little to operatic form.

In the introduction into Western European opera houses at the close of the 19th century of Russian works, notably those of Moussorgsky and Rimsky-Korsakov, with their racial

elemental qualities and barbaric stage pictures, new elements of progress and change are being realized. They, as well as Debussy's 'Pelléas et Mélisande' (1902), Strauss' 'Salome' (1905) and Stravinsky's pantomime ballets 'Petrouchka' and 'L'Oiseau de Feu'—a by-way of opera—show that the lyric stage drama has not yet reached its furthest development.

LEWIS M. ISAACS,
Musical Critic and Composer.

OPERA, NATIONAL DEVELOPMENTS, THEIR INFLUENCE AND TREND. From the year 1600 to about the middle of the 18th century, with the advent of Gluck, opera bears prominently the ineradicable mark of the land of its nativity—Italy. From Italy the new art early found its way to France, Germany and England, conveyed by Italian producers, sung by Italian artists, the music set to Italian libretti. So conditioned, it was but natural that it should flourish for a time on every foreign soil, almost untouched by local influences, and that native works should be produced in close imitation of Italian models. The years 1600 to 1750 are of great significance in music, a period of experimentation, of tremendous activity; but so far as the opera is concerned, it was only the seed-time of preparation for the harvest to come. By a natural process of evolution, the transplanted variety of opera gradually acquired individuality, but time was required to develop and perfect it. In fact, another hundred years passed before it reached the point where the new species could be said to be true to form, though not of the Italian type.

While national schools of opera are relatively a recent development in the history of the art, it is interesting to note the early indications of differentiation seen first in the adaptation to local producing conditions, and, in the use of local social conventions. With the popularization of opera went the natural reckoning with the taste and comprehension of the masses; and the first indications of local variants naturally occurred in the drama, rather than in the music, which retained its foreign character even when local stage traditions and costumes and the conventions of acting and scenery began to be employed.

When the Italian Lulli came to France and by force of his personality and genius dominated the field of opera, so that he is generally looked upon as the true founder of French opera, the ballet was in high favor in court circles and he saw at once the value of making artistic capital out of it. The emphasis which he laid upon the ballet in all of his lyric stage works gave them a certain stamp which has come to be associated with French grand opera

down to the present day and has deeply influenced its trend.

Similarly, in England, the nationalistic impulses seemed destined to have their say in the development of the masque-opera, of which Purcell was the originator. The introduction of incidental music in the stage play was familiar to the audiences of Shakespeare's day and so was its use in connection with the masque. This incidental music could scarcely be classed as dramatic; but it pointed the way to the development of a true English variation from the Italian type, which Purcell's genius was quick to realize. The circumstances of Purcell's early death, the absence of important successors, the Puritan opposition to all English stage works and Handel's advent in England soon after Purcell's death combined to stunt the growth of the masque-opera, which became entirely submerged in the foreign elements then introduced.

While these nationalistic traits were showing themselves in other lands, in Italy a local variant, opera buffa, began to develop, representing in fact a natural reaction against the remoteness from the life of the people of classical opera, or opera seria as it was called. Opera buffa began in the interludes which were presented between the acts of the opera seria. This lighter form of opera found a quick response from the public and developed a vigorous growth of its own. Characteristic of it was the use of folk song and melody akin to it, and, as might be expected, since the folk song is the most convincing expression of nationalism in music, opera buffa began to show nationalistic influences more plainly than the more serious lyric stage works. Many of the composers worked in both fields, but some of them stand out from the rest as excelling in the lighter and freer form of work. Pergolesi, for example, is much better known for his 'La Serva Padrona' (first produced in 1733) than for any of his grand operas; and this opera buffa, which still receives an occasional revival, is more typically Italian and more modern in spirit than the more serious works of the composer or his contemporaries.

The production of 'La Serva Padrona' in Paris in 1752 started a veritable conflagration, the famous *Guerre des Buffons*, in the course of which Rousseau wrote his letter to prove that French music did not exist. As though to answer him, a number of native composers began to enter the field of light opera and created the French opera comique, which substituted pictures of everyday life for the artificial classical scenes of the Lullian opera and dialogue for the stilted recitative and, above all, utilized music of the chanson type, thus giving an added touch of racial vigor and spontaneity to the genre. The opposition of opera comique to grand opera had a healthy reaction on each; and when Gluck was called to France to defend the stronghold of the conventional classical type against the onslaughts of the new radicals, he brought with him an ideal of dramatic truth and directness which breathed new life into the old stage puppets of the classical grand opera. The reactionary advocates of the conventional Italian opera seria were soon put to rout and from Gluck's day of triumph dates modern living opera.

The development of the lighter form of opera on the continent of Europe found its analogue in England in the ballad opera, of which Gay's 'Beggar's Opera' was the prototype, a work of little intrinsic merit, enlivened by popular street tunes and yet historically significant, as the forerunner of the modern high-class Gilbert and Sullivan operas.

In Germany, Mozart was more strongly influenced by the opera buffa of Italy and the opera comique of France than by the more formal classical type, and his operas, though for the most part Italian in design, were strongly German in spirit and feeling and the direct progenitors of Weber's and Wagner's works. By Mozart's time, German instrumental music had found its own particular mode of expression and a national flavor had become plainly recognizable.

Weber's works, although of a higher musical type, were still the true embodiment of German folk song. Tunes that sprang from the soil of Italy and were nurtured under its sunny skies gave natural impulse to the exaltation of vocal melody in Rossini's works and the familiar genre represented by his school. Culminating in the works of Verdi, who regenerated it by bringing it into line with the dramatic aspirations of modern music, Italian opera has, in the operas of Puccini and others of the present day school, shown that it is susceptible of all the freedom of dramatic expression that the works of Germany and France display. Yet, thanks to the persistence of native folk elements, it retains its individual national character.

The 19th century development of opera comique in France culminated in Gounod's 'Faust' and Bizet's 'Carmen.' A significant off-shoot was the opera bouffe of the second empire, notably that of Offenbach, which so perfectly reflected the foibles and vices of that period, that it attained a vogue, which threatened for a time to extinguish all serious artistic competition. French grand opera in the 19th century developed through foreign sources, yet true to type. Just as in the 18th century the German Gluck was responsible for its highest and most characteristic examples, so in the 19th century the German Meyerbeer and the Italian Rossini (with his 'William Tell'), contributed the principal operas of the distinctively French school with its continued emphasis on the ballet and the pomp and circumstance and trappings of pageantry. In the 20th century, for the first time since Rameau, Frenchmen have given the stamp to the character of French opera. The impressionism of contemporary French opera composers as emphasized in Debussy's 'Pelleas et Melisande' is in line with the direction which French instrumental music has taken and in spite of a certain melodic monotony is characteristic of modern French art impulses.

In Russia the first operas known to the Western world were those of Glinka, whose 'A Life for the Tsar' (first produced in 1836) may be said to be the foundation stone of Russian opera. Even to the present day, only a few Russian operas have come to have a general hearing. Moussorgsky's 'Boris Godounov,' Borodine's 'Prince Igor' and Rimsky-Korsakov's 'Coq d'Or' are striking examples of an independent development based upon the robust folk melody and folk tale of

Russia; while Stravinsky's essays in the field of pantomime ballet seem to be the most important and significant contribution to present day dramatic music. Spanish opera has never been a very virile plant, though the end of the 19th century witnessed a little flowering in the works of Albeniz and Granados. Spanish dance rhythms predominate in them, giving them a characteristic flavor. The only Bohemian composer whose stage works are known outside the borders of his own land is Smetana, whose 'Bartered Bride' is intensely nationalistic and a brilliant example of folk inspiration. In the Scandinavian and other European countries, as well as in America, there has been practically no operatic development of international importance. The opportunities, at least in America, have been few. However, with the modern impetus in the direction of national artistic development, it is fair to assume that in the course of time American soil will be productive of a true native growth which shall take a prominent place in the field of opera. Among the earliest attempts at real American opera were those of William H. Fry, whose 'Leonora,' produced in 1845, was his most successful work, and George F. Britton, who wrote an opera on the 'Rip Van Winkle' story. Of recent works may be mentioned Walter Damrosch's 'The Scarlet Letter,' produced in 1894, and 'Cyrano' in 1913; Arthur Nevin's 'Poia,' produced in Berlin under Muck in 1910; the prize operas 'Mona' (1911) and 'Fairyland' (1913), by Horatio Parker; 'Natoma' (1911) and 'Madeleine' (1913), by Victor Herbert; and 'Shanewis' (1918), by Charles W. Cadman. The modern native productions of operetta are of the most trifling character, with some exceptions in the works of Reginald DeKoven, Victor Herbert, Julian Edwards and John Philip Sousa. Distinctively American in character is the newer 'ragtime' music of Irving Berlin, Jerome Kern and others, which has a fascination all its own.

Musical Critic and Composer.

OPERA-GLASS (Fr. *lorgnette*), a double telescope, used for looking at objects that require to be clearly seen rather than greatly magnified, such as adjoining scenery and buildings, the performers at a theatre or opera, etc. The opera-glass is short and light, and can be easily managed with one hand. Its small magnifying power (from two to three at the most), and the large amount of light admitted by the ample object-glass, enable it to present a bright and pleasant picture, so that the eye is not strained to make out details, as in telescopes of

greater power, which generally show a highly magnified but faint picture. It allows the use of both eyes, which gives to the spectator the double advantage, not possessed by single telescopes, of not requiring to keep one eye shut (a somewhat unnatural way of looking), and of seeing things stand out stereoscopically as in ordinary vision.

The opera-glass is the same in principle as the telescope invented by Galileo. It consists of two lenses, an object-lens and an eye-lens. The object-lens is convex, and the eye-lens concave. They are placed nearly at the distance of the difference of their focal lengths from one another (see TELESCOPE). The opera-glass need not be set to a precise point, as is necessary with ordinary terrestrial telescopes, for the lengthening or shortening of the instrument does not produce so decided an effect on the divergence of the light. The change of divergence caused by screwing the opera-glass out or in is so slight as not much to overstep the power of adjustment of the eye, so that an object does not lose all its distinctness at any point within the range of the instrument. There is, however, a particular length at which an object at a certain distance is most easily looked at. The two telescopes of the opera-glass are identical in construction, and are placed parallel to each other. The blending of the two images is easily effected by the eyes, as in ordinary vision. The cheapest opera-glasses consist of single lenses; those of the better class have compound achromatic lenses. A very ordinary construction for a medium price is to have an achromatic object-glass, consisting of two lenses, and a single eye-lens. In the finest class of opera-glasses, which are called field-glasses, both eye-lenses and object-lenses are achromatic. Plössl's celebrated field-glasses (Ger. *Feldstecher*) have 12 lenses, each object-lens and eye-lens being composed of three separate lenses. See LENS; TELESCOPE.

OPERATIONS, Surgical: Measures other than medical for the relief of conditions resulting from disease or accident, and generally involving the use of cutting instruments or of apparatus. Surgical operations include those mentioned below.

Reduction of Fractures.—This process consists in so manipulating the fragments of bone as to bring them into proper position and free them from the intervening tissue, and then, by immovable apparatus, retaining them in position till union takes place from the growth of new bone or of ligament. Flat or round splints of wood, of sole-leather, of prepared felt or of pasteboard are used, or bandages impregnated with silicate of soda (water-glass), or with plaster of Paris.

Reduction of Dislocations.—The displaced bone is manipulated by the surgeon in such a way as to force it to re-enter its socket through the tear made in its capsular ligament in its exit. Leverage is used, with hand or foot or opposing muscles as a fulcrum, and retaining apparatus is applied to secure rest till swelling and other inflammatory symptoms cease.

Amputations and Disarticulations.—Amputations consist in the removal with the knife of some part of the body, as an arm, a breast, etc. In the amputation of a limb, the soft parts, after being cut through, are retracted so as to

allow the bone to be sawed off as far back in the flesh as possible. This procedure provides, after tying all bleeding arteries and cleansing the surfaces, for covering in the bone deeply with muscle and skin flaps. Before beginning the amputation of a limb, a tight rubber band is applied about it, so as to prevent hemorrhage when the arteries are severed. After these are tied, the band is removed. Disarticulation is an amputation through a joint. Skin and flesh flaps are provided, and the bone's end is well covered. In all amputations of limbs the cutting is so done that the scars resulting shall not be located so as to prevent the adjustment of an artificial limb. Many ingenious amputations of special parts of the body have been devised, as of the foot. In one of these, parts of two bones are removed, and the remnants are brought into apposition so that they unite. This is termed osteoplasty.

Ligation of Arteries.—This is an important and very frequent procedure in surgical operations. An artery may be tied in continuity in cases of hemorrhage or aneurism, etc. In such cases the artery is exposed and a blunt-end needle, with an eye near its tip, is loaded with the chosen ligature and hooked under the vessel. The ligature is caught by the surgeon with a forceps and pulled through while the needle is withdrawn. The ends of the ligature are then tied above the artery. An artery may be tied when bleeding in the stump of an amputation. Catgut, silk, kangaroo tendon and silk-worm gut are the chief varieties of ligature used. An artery is sometimes held with pins thrust through the adjacent flesh, so as to compress the vessel (acupressure), or it may be closed by being twisted at its extremity (torsion).

Excision and Resection.—Excision is the removal of a portion of the body by cutting it from the surrounding tissues. If a portion of bone or a joint be removed, the operation is termed a resection. Excision may be desirable in the case of a tubercular joint or a necrotic bone, or in hip-joint disease, for example.

Plastic Operations Upon the Face.—In these, skin from forehead or cheeks is taken to repair, for example, a nose or a lip which has been lost or excised because of disease. In some cases a finger, or the skin of the arm, may be used for this repair, the hand being fastened to the head for a few days before the transplanted part is entirely severed from its original site.

Tracheotomy.—This is the operation of opening into the trachea or windpipe through the neck, in order to insert a tube through which the patient may breathe during closure of the throat from diphtheria, or swallowing a foreign body, or other cause. A modification of this is laryngotomy, in which the opening is made through the larynx, below the vocal cords.

Paracentesis.—Puncture into the pericardial or pleural cavity to draw off fluid thence.

Operations on the Kidney.—These include that of cutting the kidney open to remove a stone, or a new growth, or to drain off fluid (nephrotomy); suturing it to the abdominal wall to prevent floating; incising and stripping off the capsule in case of Bright's disease (nephropexy); and removal of a kidney (nephrectomy).

Appendectomy.—This is removal of the vermiform appendix, a procedure necessary in many cases while the acute inflammatory process of appendicitis is in progress. In some cases where perforation has not occurred, an "internal operation" is done after the subsidence of the acute attack and before the incidence of another one. An incision is made a few inches above the groin, in the right side of the abdomen; all adhesions between coils of the intestine are divided; the appendix is found, and is cut off close to the point of emergency from the cæcum, and its stump is inverted into the intestine and fastened with sutures of catgut. The peritoneal cavity is then washed out and the abdominal wound is closed around a drainage tube. It is now advised that operation be done very early and the possibility of fatal peritonitis be averted.

Operations on the Nerves.—These may be necessary to suture divided nerves together, to resect parts of nerves or to remove ganglia in severe neuralgic affections.

Trephining.—This is opening the skull by means of the trephine, an instrument which removes a button of bone. Resort is had to it in order to explore the brain with needles or canulæ in search of abscess, hæmatoma or cyst; to elevate depressed portions of a fractured skull, and to pick out fragments of bone; to expose a sinus because of thrombosis or supuration; or for intracranial hemorrhage. The operation is also performed for the purpose of exposing various arteries and nerves. The "mastoid operation," which is frequently undertaken for middle-ear suppuration, is substantially as follows: An incision is made through the soft parts down to the bone back of the auricle of the affected side, from the tip of the mastoid process to a point opposite the upper limit of the auricle. Bleeding vessels are secured, and the periosteum is separated from the bone as far forward as the meatus. A bony projection which is thus uncovered is cut away with a chisel or gouge, and some of the cortical layer of the bone over the antrum is removed. The mastoid cells are easily reached, softened bone is scraped away and exudate is removed from the tympanum. In some cases two of the small bones of the ear, the incus and malleus, must be removed. (See EAR). Proper drainage is arranged through the wound and the meatus and sutures are put in. Consult Park, 'Surgery by American Authors' (1901); Kocher, 'Text-book of Operative Surgery' (1903).

OPERCULUM, ò-pér'kū-lūm, in conchology, the horny or limy plate developed upon the "foot" of many gasteropods, serving to close the aperture of the shell when the animal has withdrawn into its abode. The operculum is a cuticular development on the dorsal side of the foot, behind the shell. It is present in nearly all land, fresh-water and marine *Prosobranchiata*, is absent in all *Opisthobranchiata* in the adult state, except *Actæon*, and in all *Pulmonata* except *Amphibola*, and has been lost in several familiar families, as the cones, mitres and cowries. As a rule the operculum exactly fits the aperture, and hence it varies in outline in different groups; but in some cases where the aperture is very large it closes it only in part. Other abnormalities exist; and

in general the operculum is a variable character of little if any value in classification. The theory formerly held that this excrescence was homologous with a second valve, or with the byssus of bivalves, is not now considered justified by facts. Use has been found for certain round, thick and concentric opercula to represent the eyes in rude human figures made by South-Sea islanders; and as eyestones,—small lenticular and smooth ones, as of small turban-shells, which may be slipped easily around the ball of the eye beneath the eyelid, and bring out intruding and painful objects caught there.

OPERTI, ô-pâr'tê, **Albert** (JASPER LUDWIG ROCCABIGLIERA), Italian artist: b. Turin, Italy, 17 March 1852. He entered the British navy as midshipman, but resigned in 1868. He then elected the career of a painter; was illustrator, caricaturist and scenic artist in New York, and accompanied Lieut. R. E. Peary on two Arctic expeditions, during which he acted as New York *Herald* special correspondent (1896-97). From the studies made during his northern voyages he executed his well known 'Rescue of the Greely Party' and 'Farthest North' (for the Army and Navy Departments, Washington); 'The Schwatka Search'; 'Finding De Long in the Lena Delta'; and 'Dr. Kane.' He was selected as artist by the United States government to the World's Columbian Exposition.

OPHELIA, ô-fê'li-ä, in Shakespeare's play of 'Hamlet,' the daughter of Polonius. Hamlet, with whom she is in love, having unintentionally killed her father in his madness, turns away from Ophelia, whose reason is now overthrown; and in the various phases of her derangement the drama presents its tenderest scenes of pathos. While gathering flowers, Ophelia is drowned.

OPHICLEIDE, ôf'î-klîd, a brass wind-instrument of music invented about 1790 to supersede the serpent. It generally consists of a wide conical tube bent double with a bell-mouth and has 11 keys and a cup-shaped mouth-piece. Its compass ranges a little over three octaves (or 38 semitones), namely from the B flat one semitone below the lowest note of the violoncello to C in the treble staff, and it is capable of very accurate intonation. It is used in orchestras, and is capable of very pleasing effects as a solo instrument, but is all but superseded by the saxhorn.

OPHIDIA, ô-fîd'ya, an order of reptiles containing the serpents,—saurians in which the right and left halves of the lower jaw are connected by an elastic band. (See LIZARDS). The appendages and shoulder-girdles are typically absent, although in certain families rudiments of the posterior appendages and pelvis still persist. The quadrate is not fixed, and, acting as the suspensor of the lower jaw, gives a surprising capacity for swallowing. The number of vertebræ is great. The skin is covered with horny scutes, which are periodically shed with the cuticle. The eyes are without lids. The sense of smell is acute. The left lung is smaller than the right and may be quite rudimentary. A few snakes are viviparous. The *Ophidia* seem to have arisen from lizard-like ancestors

in Tertiary times. They are now nearly cosmopolitan, only the coldest countries and certain large islands (New Zealand, Ireland) being devoid of them. See SERPENTS.

OPHIOGLOSSALES, the grape fern. See FERNS AND FERN ALLIES.

OPHIR, ô'fêr, a place mentioned in the Old Testament scriptures from which the ships of Solomon brought large quantities of gold, sandal-wood and ivory wherewith to adorn the king's house, then building at Jerusalem. There are different opinions about its exact situation. Some scholars place it in northern Asia, others in India, and even America has been mentioned as comprising Ophir. Later it has been located in the East Coast of Africa. Baer identifies Ophir with Malacca. Lassen's view is that Ophir is the Semitic name for the "Abhira," a pastoral people in northern India, and that the land of Ophir is the territory they inhabit. Biblical tradition placed Ophir in southern Arabia, hence Glaser places Ophir on the east coast of Arabia. This Ophir has no connection with the same word occurring in Genesis x, 29.

OPHITE, ôf-it, in mineralogy, formerly a synonym for serpentine (q.v.); now a basic rock of greenish color and eruptive origin, with an exterior resemblance to serpentine, occurring especially in the Pyrenees. Its texture is intermediate between granite and porphyry, and its structure is characterized by the incomplete crystallization of its parts, some being completely crystallized and others entirely amorphous, a phenomenon called ophitic structure.

OPHITES, ôf-its (Gr. *ophis*, a serpent), a Gnostic sect of the 2d century who worshipped a living serpent. They considered that the serpent in Eden by misleading Eve was the liberator of man from the power of Jehovah, whom they regarded with abhorrence. It is more than probable that we have not a proper conception of the aims and beliefs of the Ophites, since their history, which has come down to us, has been written either by their enemies or by those who did not in any way sympathize with them or attempt to understand them. They seem to have been protestors against the superstitions of their age. They looked upon all the deities which assumed a position of superior power tending to monotheism as but an exaggeration of the superstitions before which the people had fallen down. They have been accused of worshipping a serpent, but this seems to have been simply symbolical, since they paid special deference to the deceiver of Eve in the Garden of Eden as the symbol of liberty from priestly deception. See SERPENT-WORSHIPPERS.

OPHIUCHUS, of-i-û'kûs, in astronomy, a large constellation, representing a man holding a serpent; called Serpentarius, the Serpent-bearer. It has about 80 stars visible to the naked eye, none of which are very bright. It has some fine globular clusters and a number of double stars.

OPHIUROIDEA, a class of the phylum *Echinodermata* (q.v.), embracing the slender-armed sand-stars. It is divisible into three orders: (1) *Streptophiura*, in which the central skeletal supports of the arms are but loosely articulated, so that coiling is possible in both a

vertical and a horizontal plane; (2) *Zygophiuræ*, where the articulations prevent coiling in a vertical plane; (3) *Cladophiuræ*, in which the arms, which are generally much branched, have saddle-shaped articulations. For the detailed anatomy of the *Ophiuroidea*, see BRITTLE STARS. See also BASKET-FISH.

OPHTHALMIA, inflammation of the eye; a general term used by the older writers, but at the present day either not employed by oculists or applied by them only to conjunctivitis (inflammation of the conjunctiva) or to conjunctivitis and inflammation of the eyelids. There are various grades and types of conjunctivitis, all of which have to a greater or less extent the following symptoms in common: photophobia—aversion to or intolerance of light; an increased and usually altered secretion; and injection of the blood-vessels, accompanied sometimes with a slight velvety opacity, or special products, a false membrane, granulations, etc. In all forms of conjunctivitis there is need of cleanliness, antiseptic washes, poultices, protection from excess of light and injuries, dust, etc. In most forms the case should be under the care of a physician.

Simple Conjunctivitis.—This is catarrhal conjunctivitis, characterized by congestion, a feeling as of the presence of a foreign body, lessened transparency of the conjunctiva of the lids, and a discharge, at first watery, then acrid, excoriating the cheeks, may become mucous or mucopurulent, gluing the eyelids together. Usually the vision is clear, but it may be hazy if the secretion is more than watery. Micro-organisms, neglect of treatment, filth and the scrofulous diathesis may convert a simple conjunctivitis into a purulent and more or less communicable or infectious disease. Usually the prognosis is good, recovery occurring in a few days.

Varieties of Simple Conjunctivitis.—Associated conjunctivitis occurs sometimes with eczema, facial erysipelas, bronchitis and other disorders; exanthematous conjunctivitis (ophthalmia morbillous, ophthalmia scarlatinous, etc.) may accompany or follow exanthematous diseases such as measles or scarlet fever; mechanical conjunctivitis is caused by wind, tobacco-smoke, dust or injuries; toxic conjunctivitis by exposure to the influence of certain chemicals, aniline dyes, chrysophanic acid, etc., or by the prolonged use of atropine, eserine, cocaine, etc.; and symptomatic conjunctivitis from the strain of the eyes in defective vision. For treatment, remove the cause if possible and alleviate associated conditions. Wash the eye frequently with cold or hot water, as agreeable, but do not rub it. As a wash or spray, 10 grains of boric acid to an ounce of water will be of service. When the discharge is mucopurulent, stronger applications are necessary.

Acute Contagious Conjunctivitis.—Known also as acute mucopurulent conjunctivitis, epidemic conjunctival catarrh and pink-eye, this was formerly classified as a severe form of simple conjunctivitis. It is distinctively contagious, attacks persons of all ages, is believed to be due to specific bacilli, resembles at first simple conjunctivitis, then the discharge is mucopus or purulent, the conjunctiva is much swollen, and even chemotic, and the lids may

be œdematous and glued together. Prognosis is good, but relapses are common, recovery taking place usually in about two weeks. Treatment is similar to that of simple conjunctivitis. The affection being contagious, all sources of such contagion as is due to towels, sponges, etc., must be discarded.

Purulent Conjunctivitis.—This acute blennorrhea of the conjunctiva is of two forms, that of the new-born (ophthalmia neonatorum), and the gonorrheal conjunctivitis of adults. Conjunctivitis neonatorum, characterized by severe pain, great swelling of the eyelids, serious infiltration of the conjunctiva, and a copious discharge of contagious pus, is caused by the introduction into the eye of infecting material (sometimes gonorrheal), usually from some portion of the genito-urinary tract of the mother, at the time of or shortly after the child's birth, or from soiled towels, etc. The chief risks are cohesion of the eyelid and eyeball, opacity, ulceration of the cornea, and sometimes perforation. Prognosis is grave, but treatment is generally successful if a competent physician has charge while the cornea is still clear. Cold compresses at first, then hot fomentations, constant gentle removal of the discharge, at first a mild eyewash, as before indicated, later the introduction of a solution of nitrate of silver (Crede's plan) or other substances, absolute cleanliness, and the destruction of lint, cotton or any infected substance, comprise the measures of relief.

Gonorrheal Conjunctivitis.—This affection (purulent ophthalmia, acute blennorrhea in adults) is usually caused by contagion from an acute gonorrhea or a gleet, or from a similarly affected eye, through fingers, linen, towels, etc., though it may arise from a vaginal leucorrhea, diphtheria and other causes. The symptoms are similar to those which appear in the purulent conjunctivitis of the new-born but more severe, and the treatment should be entirely in the hands of the physician. The vitality of the cornea is in constant danger: ulceration and matting together of the iris and cornea, inflammation of the choroid, iris, etc., and even destruction of the eye may occur. The disease may become chronic and one of the forms of chronic conjunctivitis.

Croupous or Pseudomembranous Conjunctivitis.—Of this, which is plastic membranous conjunctivitis, there are two forms, one quite mild, usually attended by a soft, painless swelling of the lids, a membranous exudation upon the conjunctiva, and generally a scanty seropurulent discharge occurring before the seventh year. The cause is not known. The second form is rapid in development, is attended with much swelling and discharge and may quickly destroy the cornea. Frequent removal of the discharge with a solution of common salt, cold compresses and the use of nitrate of silver, etc., are the measures employed for relief. The affection occurs with measles, scarlet fever, influenza and non-febrile disorders.

Diphtheritic Conjunctivitis.—This form usually occurs in young children, either mildly with pseudomembranous formation, or in a deep-seated character, necrotic, with a very painful board-like exudative swelling of the lids and a scanty seropurulent or bloody discharge. Sloughing of the cornea may occur. Prognosis

is grave. Cleanliness, antiseptic washes and building up the tone of the body are necessary.

Phlyctenular Conjunctivitis.—Also called phlyctenular ophthalmia, scrofulous ophthalmia, eczema of the conjunctiva, characterized by one or more grayish, sometimes purulent elevations, generally on the eyeball portion of the conjunctiva. It occurs in strumous and badly nourished children, and tends to a disease of the cornea (phlyctenular keratitis) and to its opacity. Attention to hygienic measures, good food, etc., tonics, mild eye-washes, followed by the application of an ointment of the yellow oxide of mercury, are requisites of treatment.

Spring Conjunctivitis.—Considered by some writers as a distinct disease, by others as a form of chronic conjunctivitis. This occurs mainly among children in the spring and summer, and is always bilateral. There is stinging pain, considerable mucous secretion and the formation of gray semi-transparent nodules, which swell and overlap the edge of the cornea. Prognosis favorable except for relapses. Treatment requires protection of the eyes with dark glasses, weak astringent and antiseptic lotions, and perhaps destruction of the granulations and hypertrophic masses.

Follicular Conjunctivitis.—Follicular ophthalmia, characterized by small pinkish prominences mainly in the conjunctiva of the lids, usually in rows. It is the result of bad hygienic surroundings, as in crowded tenements and pauper schools, where it may be epidemic. It is allied to granular lids. The prognosis is good, but the disease is troublesome, and often lasts for months. The treatment consists in general hygienic measures, and certain stimulating and antiseptic applications.

Granular Conjunctivitis.—Granular ophthalmia, Egyptian ophthalmia, military ophthalmia, known as trachoma, and, popularly, as granular lids. It occurs in acute and chronic forms, is infectious and sometimes widespread, and although affecting mainly persons of poor health and in bad hygienic surroundings, it may attack those in good health. The symptoms of the acute form are: swollen lids; reddened conjunctiva; hypertrophied papillæ, between which are non-vascular, roundish granulations; scalding tears; intense photophobia; pain in the brow and temple; and mucopurulent or purulent discharge. In the chronic form, there is less pain, redness and other results of inflammation; the conjunctiva is roughened; the granulations degenerate and soften. In both forms there is danger of cloudiness and ulceration of the cornea, and of scars with consequent deformities of the lid and its border. The sufferers should shut out the light and keep the eyes most of the time partly closed. The treatment in earlier stages calls for soothing remedies; in chronic or severe cases, caustics and astringents, operative procedures and general medication.

So prevalent is trachoma in cities, especially in the crowded tenement districts, that the health authorities now treat affected children at the schools and in their homes, thereby greatly limiting the spread of the disease and checking defects in vision. The work done on these lines in the city of New York since 1902 has been particularly noteworthy. Trachoma, mainly brought here by Russian Jews and other

immigrants from unclean environments, and which rapidly spreads by contagion, was making inroads among the more exposed children of the public schools, and threatening not only the health of New York, but, more remotely, that of the country at large. The board of health took vigorous measures for its suppression. Every child in the public schools was subjected to medical examination by experts appointed by the board, and in cases of slight affection parents were notified and instructed in the necessary precautions of cleanliness, etc.; in more advanced cases the children were taken out of school, isolated at home and there treated; and in extreme cases still more rigorous methods were adopted. At the same time all teachers in the public schools were required to observe and report upon the slightest appearance of the disease, in order that affected children might be promptly excluded. Within two years the most remarkable results were attained; trachoma was almost eradicated from the city, and it has been demonstrated that the disease, under vigilant administration of public health officials, can be brought and kept under control.

Subacute Conjunctivitis.—Sometimes chronic, this appears in association with a diplobacillus, is insidious, runs a course of six weeks to six months, is characterized by redness of the edges of the eyelid, congestion and hypersecretion of the conjunctiva. Treatment is the same as in simple conjunctivitis, with the addition of zinc-sulphate solution.

Pavinaud's Conjunctivitis.—This form, usually unilateral, is rare. It was first described by Pavinaud and believed to be due to infection of animal origin. The symptoms are swelling of the lids, mucopurulent discharge, large polypoid granulations, with ulceration between them, and lymphatic involvement. It usually lasts from one to several months. Treatment includes antiseptic washes—nitrate of silver or sulphate of copper—and surgical removal of granulations.

Chronic Conjunctivitis.—Chronic ophthalmia: it may be either an independent affection or the result of an acute blennorrhœa. As an independent disorder, it occurs mainly in elderly people. The symptoms are hyperæmia, soreness and thickening of the edge of the tarsal conjunctiva, swelling of the caruncle and slight mucopurulent discharge. Treatment: antiseptic lotions, astringents, attention to the tear-ducts and refractive errors and cleanliness. Lacrimal conjunctivitis is a form of the above, depending upon obstruction of the lacrimal passages.

Egyptian and Military Conjunctivitis.—These are terms loosely used for all forms of conjunctivitis occurring in barracks and crowded assemblies, more or less epidemic and chronic, and attended by a mucopurulent or purulent discharge.

OPHTHALMOMETER, an optical instrument devised by Helmholtz (q.v.), to measure with accuracy the dimensions of reflected images, and to determine the axis and degree of corneal astigmatism. It consists of a small telescope enclosing a combination of convex lenses with a refracting prism, attached to a graduated arc. The arc is crossed by an arm bearing two wires; one fixed, the other movable; one quadrilateral in shape, the other cut into

five steps. Fixed upon the patient's face in a frame, the oculist looking through the telescope focuses upon the patient's cornea the images of the mires, brings them into alignment, and by measurement of the original positions of the mires on the arm, ascertains the amount of strabismus present.

OPHTHALMOSCOPE, *ōf-thāl'mō-skōp*, an instrument for examining the interior of the living eye, invented in 1851 by Prof. Helmholtz, who showed that by illuminating and examining an eye in the same direction, its deeper parts become visible. The form now generally in use consists of a section, usually oblong, of a concave spherical mirror of about 10 inches focus with a small hole in the centre; and certain lenses to use with it. These lenses are mounted around the outer zone of a disc which is so pivoted that it may be revolved so as to bring the lenses successively in front of the observation aperture of the mirror. Examination is facilitated by dilating the pupil of the observed eye with atropine or homatropine; and for a complete examination this is indispensable. The person whose eye is to be examined is seated in a dark room, with a bright light on a level with his eye by the side of his head. The observer sits opposite him, and placing the mirror close to his own eye, and about 18 inches from the eye to be examined, reflects the light upon the latter, while he looks at it through the hole. The pupil in a healthy eye appears bright red or orange; opacities in the lens or vitreous humor appear black. The details of the retina, choroid, etc. (or *fundus*), can be seen in two different ways. In the *indirect method* the observer, seated as above described, holds the two and one-half-inch convex lens about three inches from the eye under examination, between it and his own, when a clear image of part of the fundus, inverted and magnified about four diameters, appears in the red light of the pupil. In the *direct method*, the observing eye must be placed as close to the observed as the intervention of the mirror will allow, when an image of a smaller part of the fundus is seen but erect and magnified about 14 diameters and a correspondingly small field of view. The fundus appears orange or red, varying in different individuals. The blood-vessels of the retina are seen as darker red lines coursing over it. The entrance of the optic nerve, commonly called the disc, from which these vessels diverge, appears as a round disc of a much paler color. A variation of this instrument has an attachment resembling a microscope by which the image entering the lens at the observation aperture is magnified up to 40 diameters. This attachment may be for use with a binocular form of the observing microscope; or, again, it may be so fitted with reflecting prisms that two observers may make the examination simultaneously. The latter form is of peculiar value in consultations, and also in coaching students in ophthalmology (q.v.).

OPIE, *ō'pī*, **Amelia Alderson**, English novelist: b. Norwich, England, 12 Nov. 1769; d. 2 Dec. 1853. She was married to John Opie, the portrait painter, in 1798. In 1801 she published 'Father and Daughter,' a novel which at once attracted attention. After the death of her husband in 1807 she returned to her father's

home, in Norwich, where she occupied a high position in society and subsequently joined the Society of Friends. She published 'Adeline Mowbray' (1804); 'The Warrior's Return and Other Poems' (1808); 'Madeline' (1822); 'Lays for the Dead' (1833), etc. Consult the 'Life' by C. L. Brightwell.

OPIE, **Eugene Lindsay**, American pathologist: b. Staunton, Va., 5 July 1873. He was graduated at Johns Hopkins University in 1893 and took his M.D. there in 1897. He was connected with the staff at Johns Hopkins Hospital in 1897-98, and with the faculty of the university in 1898-1904, serving also as pathologist to Bay View Asylum in 1898-1904. He was a member of the Rockefeller Institute for Medical Research in 1904-10; and visiting pathologist to the Presbyterian Hospital, New York, in 1907-10. In 1910 he was appointed to the chair of pathology at Washington University, Saint Louis, and in 1912-15 he was dean of the medical faculty there. He was commissioned captain in the Medical Reserve Corps in 1917 and served with unit one (Washington University) in France. He published investigations of malarial parasites (1898); of the anatomy and pathology of the pancreas, and the relation of pancreas to diabetes (1899-1902); of inflammation, tuberculosis and diseases of the liver (1902-13); effects of diet (1914-15). He was co-editor of the *Journal of Experimental Medicine* in 1904-10. Author of 'Diseases of the Pancreas' (1902).

OPIE, **John**, English painter: b. Saint Agnes, Truro, Cornwall, May 1761; d. 9 April 1807. When about 19 he was taken to London by Dr. Wolcott ('PETER PINDAR'), who befriended him in various ways. Through the influence of his patron he acquired great fame as a portrait painter, became known as the 'Cornish Wonder,' and while this season of favor lasted, realized a moderate fortune. He made illustrations for Boydell's Shakespeare and Macklin's Poets. His portraits were, for the most part, of poets and authors and are, therefore, also valuable from an historical point of view. He then turned to historical painting, and produced his 'Murder of James I of Scotland'; 'Slaughter of Rizzio'; 'Jephtha's Vow,' etc. His 'Slaughter of Rizzio' was exhibited in 1787, and secured his election to the rank of associate to the Royal Academy. In 1788 he was appointed a Royal Academician. In 1805 he was elected professor of painting in the Royal Academy, but only delivered four lectures before his death, and these with a memoir by his wife were published in 1809. He is also the author of the biography of Sir Joshua Reynolds in Wolcott's edition of Pilkington's 'Dictionary of Painters' and of 'An inquiry into the Requisite Cultivation of the Arts in England,' which among other influences led to the formation of the National gallery. His work is characterized by great originality, though it frequently lacks harmonious coloring and refined elegance. His second wife was Amelia Alderson Opie (q.v.).

OPISTHOGLYPHA, *ō'pīs-thōg'li-fā*, a group of colubrine serpents having comparatively weak powers of poisoning their prey, and so securing immobility by paralysis. In these snakes one or a few of the posterior maxillary teeth have a groove on the front side,

down which poison may flow from glands in the lips. The supply is rarely enough to affect a man or large animal much although some of the species are of rather large size. The group includes the long tree-snakes of the Eastern and American tropics, several familiar terrestrial snakes of the Mediterranean region, and some East Indian genera. An interesting fact is that the group connects the non-poisonous Colubridæ with the highly venomous vipers, whose poison apparatus seems to have been evolved from an opisthoglyphous type.

OPITZ, o'pits, **Martin**, German poet and critic, the "Father of modern German poetry": b. Bunzlau, Silesia, 23 Dec. 1597; d. 1639. Educated at Heidelberg, he became the centre of a circle of young poets. He fled to Holland in 1620 to escape the plague but returned to Silesia in 1622 and taught for a time. In 1625 he was ennobled and crowned with laurel for his poetic fame by the emperor. From 1628 to 1632 he was secretary of Dohna, the persecutor of Silesia, and then became the client of Ulrich of Holstein, as ardent a Protestant as Dohna was a Catholic. But the story of his life, with its changing of sides and its petty flatteries is less important than his literary work. When scarcely 21 he wrote 'Aristarchus, seu de Contemptu Linguae Teutonicæ,' urging the infusion of classical imitation into German poetry; and in 1624 this German Boileau published 'Das Buch von der deutschen Poeterey,' which insisted on accent in place of mere numbered syllables and in many other respects made possible the revival of German poetry in the 17th century. Three years later he wrote the verses of 'Dafne,' said to be the oldest German opera, to the music of Heinrich Schütz. His poetical work was correct, unoriginal, and various, including manifold versions and imitations. The antiquarian epic 'Zlatna' (1623); the 'Trostgedichte in Widerwärtigkeiten des Krieges' (1633), the best of his metrical attempts; 'Deutsche Poemata,' a book of selections; and a pastoral 'Die Nimfe Hercine' (1630). Consult the German biographies by Strehlke (1856), Palm (1862), and Hoffmann von Fallersleben (1858), and Perry, 'From Opitz to Lessing' (1884).

OPIUM, the dried milky juice of the unripe capsules of a poppy (*Papaver somniferum*), which for this product has been cultivated through many centuries. Every species of poppy is capable of yielding it to a greater or less extent. Opium is procured by making incisions in the poppy-head or capsule, taking care not to penetrate its cavity; the juice then exudes in drops, and after being allowed to remain for a day upon the edges of the incisions, it is scraped off—a brownish, jelly-like material. As the soft opium accumulates it is molded into roundish lumps or irregular flattened cakes, of various sizes, and put aside to dry. When of proper consistency it is generally wrapped in leaves and sent to market. When fresh the lumps and cakes are plastic, becoming harder on the exterior, are of a chestnut or darker brown, and have a disagreeable, even sickening odor, and a bitter nauseous taste. Sometimes opium of commerce is mixed with pebbles, shot, ashes, clay, sand, and with resinous, saccharine and mucilaginous substances, and has an excess of moisture. Adulteration in the United States

has been reduced to a minimum under the operation of the Food and Drugs Act of 30 June 1906. Opium is a complex substance. "It ordinarily contains an odorous principle, glucose, gum pectin, a compound resembling caoutchouc, wax, fat, resin, coloring matter and plant-tissue," also the neutral principles meconin and meconiosin, and meconic acid and thebolactic acid, similar to lactic acid. The most important of the derivatives obtained from opium are its alkaloids, 19 in number. In all probability the poppy was originally brought from Asia Minor. It is now grown extensively there, and in Egypt, India, Persia, China and Japan, less extensively in several parts of Europe, especially France and Germany, and in the United States. As an ornamental flower it is cultivated in nearly all temperate countries.

The principal varieties of the opium of commerce include Turkey opium, used principally in Europe and America; Persian, of variable quality, seldom used in this country; East Indian, rather a poor variety, used at home and exported to China and other Asiatic countries; Chinese, consumed in the East, largely for smoking.

Alkaloids of Opium.—Those at present recognized are morphine, which crystallizes in white needles, and which was discovered in 1816 by Sertürner; narcotine (shining prisms or long needles, tasteless, odorless), discovered in 1803 by Derosme, although its basic nature was first shown by Robiquet in 1817; codeine (nearly colorless octahedra), discovered in 1832 by Robiquet and described by Grimaux in 1881; prepared from morphine by heating it with methyl iodide and soda, it is methylmorphine; narceine or narceia (long quadrangular prisms or white silky needles, odorless), discovered in 1832 by Pelletier; pseudomorphine (fine crystalline powder, derived from morphine), also called phormine and oxydimorphine, discovered in 1835 by Pelletier and Thibournevy; thebaine or para-morphine (silve scales or prisms with styptic taste), discovered in 1835 by Thibournevy; paparenine (colorless needles or prisms), discovered by Merck in 1848; rheadine (white tasteless prisms), discovered in 1865 by O. Hesse; cryptopine (minute prisms), discovered in 1867 by T. and H. Smith; oxynarcotine (isolated from the mother liquor of narceine), discovered in 1876 by Wright and Beckett; gnoscopine (woolly needles, obtained from narceine), discovered in 1878 by T. and H. Smith. In 1870-78 O. Hesse announced the discovery of lanthopine (finely crystallized), meconidine (amorphous, not stable), laudanine (large crystals), codamine (crystalline), deuteropine, laudanoline (crystallizable), and protopine (crystallizable). The discovery of hydro-catarnine (crystallizable) was announced in 1869 by Mathieson and Wright. Apomorphine or apomorphia, derived from morphine or codeia, although a depressant, is a prompt and valuable emetic.

Of the alkaloids of opium, morphine, codeine, narceine and thebaine are of most importance. Morphine in its action on the body very nearly represents that of the crude drug. Morphine occurs in different kinds and grades of opium in amounts varying from a fraction of 1 per cent up to nearly 25 per cent. The United States Pharmacopœia prescribes a mini-

num of 9 per cent morphine for opium. The average dose of opium for an adult is one grain; of morphine, one-eighth to one-fourth grain. Codeine acts like morphine, but is weaker, and is less likely to be followed by headache, constipation and other unpleasant symptoms. It is used principally to allay pain and coughs. "Codeine, paparenine, cryptopine and narceine have a certain soporific action, but the remainder of the alkaloids are almost devoid of it." Thebaine is antagonistic to morphine; is a powerful and poisonous irritant of the spinal centres, producing convulsions. Therapeutical uses for it have not been developed.

Official Preparations of Opium.—The principal preparations (including the alkaloids) are the acetate, hydrochlorate and sulphate of morphia, sulphate of codeia, powdered opium, pills of opium (opium and soap), Dover's powder (opium, ipecac and sugar of milk), troches of licorice and opium, tincture of opium (laudanum), deodorized tincture (McMunn's elixir), camphorated tincture (paregoric), tincture of ipecac and opium (liquor Dover's powder), vinegar and wine of opium and opium liniment. The use by the physician of one or other of these preparations is to a certain extent a matter of personal habit. The alkaloids are generally considered to act more promptly than opium itself and its solid and liquid preparations, and to be less constipating. Solutions of opium are more prompt in action than solid preparations and salts of morphine than morphine itself.

Properties and Use of Opium.—Opium is a stimulant narcotic; in small doses, stimulant; in larger, a sedative; and in still larger, a narcotic poison. It is readily absorbed from the stomach, less quickly from the rectum and vagina and very little from the skin, if it is not abraded. When injected under the skin (subcutaneous, hypodermic or hypodermatic use), its action, as a rule, is rapid. Opium is used by many nations for its exhilarating and anodyne influences, being either eaten, smoked or used as a substitute for alcoholic drinks. Medically, it is used to relieve pain, to produce sleep in certain low conditions, to allay nervous irritation, as in coughs, to check excessive secretion, as in diarrhoea, dysentery and diabetes and to support the system when sufficient food cannot be retained. The action of opium is not always uniform. With some individuals, due to age, race temperament, condition of health, personal idiosyncrasies, etc., opium produces effects different from the ordinary results, such as delirium, cramps, vomiting, severe headache and itching of the skin. Young children, old people and persons of a nervous temperament are particularly susceptible to the influence of opium; small doses sometimes producing in these coma and even death. On the other hand, severe pain, flooding, etc., sometimes requires three to four times the ordinary dose. Many of the soothing syrups and carminatives contain opium. It is believed by many physicians that morphine should never be given to a child under 10, nor a hypodermic injection to a child under 15. In frogs small doses of opium produce tetanus; in mice, convulsions; they stupefy dogs and rabbits; while it requires large doses to poison ducks, chickens and pigeons. In small doses, opium usually excites or stimulates, increasing the fullness, force and frequency of the

pulse, the temperature of the skin, the power of the muscles, arousing mental action and affording bodily and mental calm. In a variable time, usually within an hour after the opiate has been taken, there is a disposition to sleep or repose. On arousing from sleep there is frequently headache, with nausea, tremors, etc., until the body recovers its energy. Most of the secretions are diminished by opium, the peristaltic action of the bowels lessened, pain and muscular contractions or spasms allayed and nervous irritation relieved, but always with the risk of repetitions of the dose and the formation of the opium habit.

Opium-Poisoning.—This is quite frequent, due to the overuse of the drug to relieve pain or produce sleep, or as an indulgence, it being unfortunately too easy to procure opiates. Poisoning is principally from the salts of morphine, either used alone or in patented compounds. The primary or stimulant effects may be loquacity, restlessness and hallucinations, although the period of exaltation may be short, if present at all, the symptoms of the second or intermediate period rapidly appearing. These are similar to those of congestion of the brain, weariness, dullness, drowsiness, a sense of weight in the extremities; the face is pale, suffused or cyanotic; the pupils are slightly contracted, the breath is slow and may be deep and stertorous; the skin may be dry and warm or cool and wet; the pulse is generally normal; the patient is unconscious, but may be roused by shaking, by the infliction of pain or by loud talking, and when aroused, his breathing becomes more rapid. In the third period, that of narcosis or coma, the patient cannot be aroused; the face is pale and cyanotic (bluish, especially the lips); the pupils are insensible to light, usually contracted to the size of a pinhead, sometimes dilated toward the end of life; the pulse is rapid and feeble; breathing is slow and shallow, with increasing intervals and some times is stertorous; the skin is bathed at first in warm perspiration, then becomes cold and clammy. Convulsions are rare. Recovery may even now take place, or death occurs from failure of respiration and arrest of the heart's action. A post-mortem examination may reveal nothing abnormal; or the brain may be congested, the vessels of the cerebrospinal axis gorged with dark blood, the lungs, heart, liver and spleen distended with dark fluid blood, and serum may fill the ventricles and be beneath the arachnoid.

Treatment of Opium-Poisoning.—Produce emesis, with copious drafts of warm water, with a tablespoonful of salt or a teaspoonful of mustard well stirred in; by tickling the throat with a feather; or by use of a stomach-pump. Wash the stomach continually since excretion of the poison may be expected from the circulation thither. For the washing use a one-tenth per cent solution of potassium permanganate, which may perform a most valuable service in oxidizing the poison. Apply cold affusions to the head and spine, and flagellation to the palms, soles and calves, and with a damp towel to the back; keep the patient walking briskly, though he begs for rest; give strong coffee and aromatic spirits of ammonia; frequently use the Faradaic current upon the limbs, and resort to artificial respiration if

necessary. The bladder should be kept empty. Atropine aids respiration, but must be used with the greatest caution.

The Opium-Habit.—Indispensable as opium is in certain affections, in the hands of the thoughtless and weak it is too often a curse. It is the most seductive of all the narcotics. "By its soothing and exhilarating influences it gains such a hold on the moral and physical nature that the strongest will is unable to emancipate the victim from its enchantment, and moral degradation results." With children its frequent use in cough-mixtures, carminatives, etc., interferes with the assimilation of food, enervates the system and prepares the way for depraved appetites. The opium-habit seems to be a disease of comparatively recent times, dating, as some believe, from the invention of the hypodermic syringe in 1848. Undoubtedly the consumption of opium has increased steadily within the last 70 years. This is due largely to the fact that neuroses have increased, owing partly to a more and more hurried and intense mode of living, and in part to the ease with which opiates are obtained and the attractive forms in which they are presented—granules, triturations, etc. The habit is often induced by the frequent use of opium to relieve pain or produce sleep, or is contracted simply through yielding to sensuous enjoyment, as in opium-smoking. It may also be due to defective will-power, transmitted sometimes in a neurotic taint from opium-taking parents and grandparents.

Victims of the opium-habit frequently become so demoralized as to need care in an asylum. They lie, steal, lose self-respect and ambition, are forgetful, may be subject to delusion, fear and superstition, and are careless as to clothing and necessary habits, while still thinking highly of themselves. The great nerve-centres tolerate stimulation to a certain point. When the limit is reached, the time varying in different persons, the action of the various organs and tracts is disordered. The victim of opium suffers from imperfect digestion, faulty appetite and assimilation and consequent malnutrition. The red blood corpuscles diminish, he is pale, has nausea, muscles are flabby and endurance weakens. The kidneys become affected, the skin is congested, and when the disease is advanced, purpura appears. There is often a malaria-like fever. The functions of the testicles in the man and of the ovaries in the woman are suspended. Primarily there is functional derangement of the brain, then permanent deterioration. He becomes a slave to his depraved appetite. When the time draws near for his allotted dose he is nervous, yawns, may have neuralgia, is weak, breaks out into a perspiration and is miserable. He takes his dose and is himself again; but after a time the dose has to be increased, and if relief from his cravings is not obtained he sinks lower and lower and dies a wretched death. Two methods of cure are employed; one is the gradual reduction of opiates, the other is their sudden withdrawal—in either case giving in their stead bitter tonics, stimulant carminatives, such as ginger and certain stimulants and medicines. The law holds opium habitués, as it does drunkards, responsible for crimes which they commit. It is estimated that the vicious use of opium is about 50 times as great as its medicinal use,

in connection with which it is well to remember that probably more than half of that usually classed as medicinal is in reality vicious. Consult 'United States Dispensary and Reference Handbook of the Medical Sciences'; Potter, 'Handbook of Materia Medica, Pharmacy and Therapeutics' (1901); 'Reference Handbook of the Medical Sciences' (Vol. VI, New York 1916).

OPIUM, Wild, an American wild lettuce (*Lactuca canadensis*), noted for its tallness, reaching a height in some plants of 10 feet.

OPIUM TRAFFIC, The. Opium as an article of commerce begins to be mentioned in history in the 9th century when it was brought into China by traveling Arabs. In the 12th century opium was being brought from India to China in the native junks. At that period its use was purely medicinal. In the second half of the 18th century the importations into China began to assume large proportions through the activities of the Portuguese traders. The first edict against it had been issued by the Chinese Government in 1729, but no attempt was made to enforce it. In 1757 the East India Company acquired a monopoly of the opium trade of India, where, since 1793, the drug has been a government monopoly, the cultivators, in Behar, Benares and Malwa being paid at a fixed rate for their crops for exportation to China. The trade was contraband, the Chinese government having in 1796 prohibited the importation of opium. Through the connivance of the Chinese local officials, the importation about trebled in the 20 years between 1816 and 1836. In 1729 the imports had totaled 29,866 pounds. By 1775 they had risen to 149,000 pounds. In 1790 they were 754,700 pounds; and in 1830, 2,520,300 pounds. In March 1839 the Chinese authorities forbade all foreigners to quit Canton and ordered them to deliver up the opium in their possession and seized that on board of British ships in the harbor, 20,291 chests in all, amounting to 3,030,125 pounds, valued at \$10,000,000. This the Chinese officials destroyed. War with Great Britain resulted, which ended in the defeat of the Chinese, who were obliged to cede Hongkong as well as pay a large indemnity for the opium. The treaty of Nanking under which the war was settled was signed in 1842. It provided that five ports of China should be freely open to foreign trade. The Chinese Government still held to the prohibition of the importation of opium but no further attempt was made to enforce it. By 1850 the annual importations of opium from India and other British territories had risen to 7,056,700 pounds. In 1858, under great pressure, internal as well as external, China placed opium on the list of lawful imports. Opium smoking had then become prevalent all over China. In 1880 the imports amounted to 12,911,800 pounds and the Chinese themselves were raising large quantities of it, the profits being much larger than for wheat and other farm crops. In 1900 the Chinese raised 45,000,000 pounds of opium and consumed it all but 660,000 pounds which was exported. In addition to this prodigious quantity they consumed also 7,230,000 pounds imported from India. By 1906 China had 15,000,000 opium smokers and it was estimated that nearly or quite half of her 400,000,000 population used the drug in some

form. The annual income of the Chinese government in customs and licenses in the opium traffic amounted to \$30,000,000. In that year, however, the Empress Dowager issued a decree ordering the opium habit to be extirpated in China within the space of the next 10 years. Appeals made to the British government to co-operate by checking the export traffic from India received the backing of the British public and of some of the officials and it was agreed that if China actually carried out her program of wiping out one-tenth of her internal opium traffic annually for the next three years, the British government would undertake to shut off the India exports in the same proportion. The closing of opium dens began at once and was carried on relentlessly. The poppy farms were decimated by law and many of the farmers ceased voluntarily to raise the drug plant, so that by 1909 fully one-half of the former poppy-growing acreage was in other crops and 2,000,000 opium dens had been closed. By 1912 five of the 18 provinces of China had been entirely closed to the opium trade and in 1913 five more were freed. In 1914 the freed provinces numbered 15. The remainder of the country would have been quickly cleared up but for the treaty of 1911 with the British government under which the Shanghai opium combine was operating. Through this treaty the three provinces, Kwangtung, Kiangsu and Kiangsi were held open to the traffic until March 1917, when the last ounce of smoking opium was (legally) imported into China. The combine made a strong fight to continue the trade, offering the Chinese government \$16,000,000 for an extension of time to 1 Jan. 1918. But though China was in serious financial straits at the time, the offer was refused. The last opium farm in China had been closed down in November 1916 and on 30 June 1917 absolute prohibition of opium smoking in China went into effect.

While the opium plague was thus being stamped out in China, it was spreading in India. In the fiscal year 1901-02 the consumption of opium in India was 847,332 pounds. Ten years later it was 1,028,892 pounds. In some sections of India the annual consumption of the drug amounted to 18.7 pounds per 1,000 of the population. In Calcutta about one-tenth of the people were opium eaters and in the Assam section the proportion of opium smokers and eaters was at least 20 per cent and was estimated by some officials as 25 per cent.

Recent reports of travelers in the Dutch East Indies, particularly in Java, have voiced severe criticism of the government of the Netherlands for promoting the spread of opium consumption in those islands. The Netherlands government controls the opium trade in those islands as a monopoly and maintains retail shops where so small a quantity as five cents worth can be freely purchased. It is charged that the opium traffic brought into the treasury of the Dutch government in 1902 the sum of \$5,500,000 and that in 1914, while China was rigorously cutting out the traffic on her soil, the Dutch collected \$8,400,000 from the Dutch East Indies opium trade. To this the government replied that though the revenue had indeed increased, the traffic had been cut down by 55 per cent between 1890 and 1911; and at any

rate the consumption of opium was not by Dutch subjects but was confined to the 300,000 Chinese immigrants residing in the islands.

The Japanese government has always steadfastly opposed opium and the law forbids its importation, possession or use except as a medicine. With the occupation of Formosa in 1895, the Japanese government found nearly 7 per cent of the 3,000,000 inhabitants to be opium smokers. The government took over the opium traffic as a monopoly and licensed the opium users, at the same time preventing the spread of the habit and administering a cure to the younger habitues. In 1900 there were 169,000 opium users on the register. In 1903 the number was 143,500. During the years following a large number of additions were made, due to the immigration of Chinese devotees. The number is steadily diminishing, however, and the traffic will eventually wear itself out.

With the occupation of the Philippines the United States succeeded to an extensive opium traffic. A government measure proposed for its regulation was suppressed in consequence of a vigorous outcry raised in the States against the legalization of the traffic in the drug and against any form of governmental participation in the profits realized from its sale. Under the law of Spain in force in the Philippine Islands for years before the American occupancy, the Filipinos were forbidden to smoke or use opium and all dealers in opium were forbidden to sell the drug to the Filipinos or to permit it to be used on their premises by Filipinos. The Spanish system provided for the sale of the privilege of selling opium to Chinamen in each province to an opium farmer or contractor. It provided that opium should only be used or smoked in certain places, which were under the surveillance of the police and if a Filipino was found in such resorts he was arrested and the owner of the resort was subjected to punishment. This was the system at the time of the American occupation, but it was found that there were at least 10,000 Filipino addicts to opium in some form, although few smokers. The Spanish regulations were not continued by the American authorities, and for nearly five years the only checks upon the sale and use of the drug was a duty imposed in the custom-house and a provision in the municipal code requiring municipal councils to pass ordinances punishing the keepers of dives in their respective towns. In 1903 a commission was sent to visit the opium-consuming countries near the Philippines and to report on a plan to control the traffic. The commission commended the Japanese method in Formosa but it was not put into effect. In 1907 the Philippine commission passed an opium law prohibiting the use of the drug except under the direction of a registered physician and made the mere possession of the drug a crime punishable with fine and imprisonment. In 1903 the imports of opium were 254,547 pounds, in 1909 they were 93,053 pounds. The weight of the opium imported in 1915 is not given but its value is stated at \$4,600—about 1,500 pounds.

In the United States there are said to be about 200,000 persons who are habitual users of drugs and a few more than half use opium. Since the passage of the Harrison Law in 1915, the annual opium importations have fallen from

491,600 pounds in that year to 165,000 pounds in 1916 and to 86,812 pounds in the fiscal year ended 30 June 1917. A great deal of opium smuggling is carried on across the Mexican border and some across the Canada line and it is probable that an occasional batch gets in along the Pacific Coast. It is impossible to estimate as to these illegal importations.

OPODELDOC, ǝp-ǝ'dēl'dōk, a medicinal plaster, said to have been invented by Mindererus and used for external injuries. The name is now applied to a liniment which is much used as an anodyne application in sprains, bruises and rheumatic pains. It is prepared by dissolving three ounces of common soap in a pint of alcohol by the heat of a sand bath, then adding an ounce of camphor and a fluid dram each of oil of rosemary and oil of origanum. It concretes into a soft, translucent, yellowish white mass, of the consistency of soft ointment; but it becomes liquid when rubbed upon the skin.

OPON, ǝ'pōn, Philippines, a pueblo of the province of Cebú, situated on the northwestern shore of Mactán Island, three miles across the channel from the town of Cebú. In 1521 Magellan was killed here in conflict with the natives. Pop. over 20,000.

OPOPANAX, ǝ-pǝ'p'a-năx, a gum resin with a peculiar acrid odor, the produce of an umbelliferous plant, *Opopanax chirorium*. This plant is a native of southern Europe and Asia Minor and the granular gum is brought to market from the Levant. The physicians of ancient times highly esteemed it for its purifying and aperient virtues and it still continues a famous medicine in the East, where it is looked upon as a cure for almost all diseases. The perfume known as opopanax is not derived from this gum-resin. There is a commercial opopanax, a kind of perfumed myrrh, obtained from a Balsamodendron, largely imported into Germany, where an essential oil is distilled from it.

OPORTO, ǝ-pǝr'tō (Port. "the port"), Portugal, a large city and seaport, capital of the province of the same name, on a steep declivity on the right bank of the Douro, about two miles from its mouth, and 170 miles north of Lisbon. The river is crossed by a bold and striking railway bridge, and a high and low level bridge for tramways and foot passengers. The houses rise one above another in terraces, and there are well-built quarters with broad and straight streets, public gardens, promenades, and other attractive features. The chief buildings comprise the Gothic cathedral, and some interesting churches; the bishop's palace, the exchange, the town-house, the custom-house, the English club, the great hospital, the opera-house, theatre, crystal palace. One of the most striking architectural objects is the Torre dos Clerigos (Tower of the Clergy), attached to the church of the same name. Oporto, which is very modern, is noted for its commercial interests and its extensive industries. Its principal trade is in wine, white and red, but chiefly the latter, much of which is sent to Great Britain, and derives its name *port* from this city. There are manufactories of excellent cottons, silks, woolen and linen stuffs, pottery, lace, buttons, jewelry, preserved foods, glass and leather. Royal tobacco and soap works, iron-

foundries and sugar-refineries are also in operation. The chief exports, in addition to wines, are olives, olive and other oils, raisins, onions, oranges, lemons and other fruits, salt, cork, cattle and building materials. In ancient times the site of Oporto was occupied by the harbor town Portus Cale afterward Porto Cale, from which the name of the kingdom, Portugal, is derived. Oporto was the capital of Portugal till 1174, when the seat of government was transferred to Lisbon. It was taken and sacked by the French in 1805, who retained possession of it till 1809, when the British crossed the Douro and compelled them to retire. Oporto having sided with Dom Pedro, it was besieged in 1831-32, for over a year, by the troops of Dom Miguel, when much of it was destroyed, and its trade was, for the time, annihilated. Pop. about 200,000.

OPOSSUM, the name, adopted from the Indian name of the northern species, for the family of American marsupial mammals *Didelphyidae*, more particularly for the typical genus *Didelphys*, and specifically for *D. virginiana* of the United States. The place of this family in the order is among the higher polyprotodonts associated with the dasyures and bandicoots (*Perameles*). Their greatest peculiarity lies in the fact that, with a single exception, this group contains all the marsupials existing outside of Australasia. The family itself is not represented there, for various marsupials carelessly called "opossums" in Australia are not members of this family, which is confined to America, and mainly to its tropical parts, where doubtless it is a survivor from the Mesozoic Age when marsupials were generally distributed over the whole world. The opossums are arboreal omnivorous animals, ranging in size from that of a cat to that of a mouse. They have 50 teeth, having 10 incisors in the upper jaw and eight in the lower, one canine tooth on each side in each jaw, three compressed premolars and four sharply-tuberculated molars on each side. The head is long, muzzle pointed, ears large and naked. The fur is long, loose and grizzled. The tail is long, prehensile, and in part scaly. The feet are plantigrade, with five toes on each foot, their claws long and sharp; but the inner toe of the right foot converted into a thumb, destitute of a claw, and opposable to the other digits. The pouch, so characteristic of marsupials, is absent in the familiar northern species, and most others, the nipples opening between folds of skin which represent a marsupium. To these the minute young are attached by the mother as soon as born, which is after only about 26 days of embryonic life, and when still in a very undeveloped condition; and there they cling five or six weeks until able to run about. The young are numerous and remain with the mother until well grown, clinging to her fur and being carried about as she scrambles among the branches, with their tails tightly wound about hers, or about her limbs or neck. Their prehensile rope-like tails are of vast service to these animals, enabling them to use all four feet in food-gathering while suspended by this useful fifth member.

In habits the opossums generally are nocturnal. The food consists chiefly of insects, small mammals, and birds; most species are fond of fruits; and the Brazilian crab-eating

opossum (*D. cancrivora*) obtains its name from its partiality for the flesh of crabs, which the northern species will also eat, as well as frogs, when other food is scarce. They are pre-eminently arboreal animals, and make their homes in hollows of trees, bedded with leaves and soft grass; here the days are spent in drowsy hiding, and the young are brought forth in early summer. Owls frequently share these hollows with the opossums. On the ground the movements of the opossums are slow and awkward. They get credit for being exceedingly cunning animals, and are famous for their skill, and patient endurance of indignities and even torture, in counterfeiting death when threatened with harm. "Playing 'possum" has passed into a proverbial expression to indicate any deceitful procedure. Some observers declare that this supposed counterfeit of death is solely the paralyzing effect of fear, but this simple explanation is not generally regarded as wholly adequate to account for the phenomenon.

The number of species in this family is undetermined, but more than 20 have been named, mainly small animals of South America. The most remarkable form, perhaps, is the tiny reddish "mouse-opossum" (*D. murina*) of Mexico and southward, which is no larger than a field-mouse. Other species are shrew-like. Of a different genus is the curious yapok (*Cheironectes variegatus*), found from Guatemala to Paraguay, which has the hind-feet webbed. It swims and dives with great ease, gathering from the water its food, consisting of fishes and crustaceans. It inhabits holes in the banks of rivers, and is strongly marked with brown bands on a gray ground. Several of the tropical species are more strongly colored than the northern opossum, which is simply whitish gray.

The flesh of all the larger species is eaten, and that of the Virginia opossum is regarded as one of the woodland delicacies of the Southern States. Hunting the opossum with dogs at night is a favorite sport in the South, especially in autumn, when the body has a thick layer of fat all over. The animal takes refuge in a tree, and is either shaken down or shot as it hangs by the tail. The flesh is usually baked and eaten with roasted sweet potatoes.

Consult writers upon American mammals, as Audubon and Bachman, Goodman, Allen, Merriam, C. C. Abbott, D. L. Sharp, etc. For the family generally consult Beddard, 'Mammalia' (1902); Goeldi, 'Proceedings' of the Zoological Society of London, 1894, p. 457; or any treatise on mammals.

OPOSSUM-MOUSE, one of the diminutive, active, very mouse-like flying phalangers (q.v.) of the genus *Acrobates*.

OPOSSUM-RAT, a book-name, translated from the local name "*raton runcho*," in Ecuador, of a rare little marsupial inhabiting the northern Andean region, which is of special interest because it represents in America an entirely different branch (the diprotodont) of marsupials from the marsupials, and is the sole survivor of a family (*Epanorthidæ*) formerly prevalent in Patagonia. It looks like an opossum of the size of a rat, lives in high brush-wood, feeds mainly on birds and their eggs, and specimens are obtained rarely and with difficulty. It was first described in the 'Proceedings' of the Zoological Society of London

for 1860, by R. F. Tomes, in working out a collection of small mammals obtained by Louis Fraser in Ecuador, who published the first notice of *Cænolestes*, which he described under the name *Hyracodon fuliginosus*. Oldfield Thomas rediscovered Tomes' genus in a specimen obtained near Bogotá. This specimen Thomas found it necessary to consider as representing a new species. The name *Hyracodon* having been found to be preoccupied, Thomas suggested *Cænolestes*, calling his specimen *obscurus* and Tomes' *fuliginosus*. Consult Thomas, *Proceedings* Zoological Society of London for 1895, p. 870.

OPOSSUM-SHRIMP, *mysis stenolepis*, a small, shrimp-like marine crustacean of the order *Schizopoda*, so called because of the egg-carrying pouches between the thoracic legs of the female. See CRUSTACEA.

OPPELN, ȯp'pĕln', Prussia, river port and capital of a district in the province of Silesia, on the Oder, 51 miles southeast of Breslau, on the railway to Kattowitz and at a junction connecting it with Beuthen, Neisse and Tarnowitz. It has a church of Saint Adalbert, founded in the 10th century, and the 15th century palace of its dukes is situated on an island in the Oder. The town was in a prosperous condition as early as the 11th century, and was incorporated in 1228. In 1163-1552 it was the capital of the duchy of Oppeln. On the extinction of its line of dukes it became Austrian territory but was ceded to Prussia in 1742. There is a normal seminary and a Roman Catholic gymnasium. Manufactures include beer, cement, cigars, lime, lumber, machinery and soap; and there is an extensive trade in cattle, grain and the rich mineral products of the district. Pop. (1910) 33,907.

OPPENHEIM, ȯp'ĕn-hĭm, E. Phillips, English novelist: b. 1866. He was educated at Leicester, England, has become very popular there and in the United States. Among his published works are 'Enoch Strone'; 'A Man and his Kingdom'; 'A Millionaire of Yesterday'; 'The Survivor'; 'The World's Great Snare'; 'The Master Mummer'; 'Anna the Adventuress'; 'Mysterious Mr. Sabin'; 'The Traitor'; 'A Prince of Sinners'; 'Mr. Wingrave'; 'A Maker of History'; 'The Secret'; 'Conspirators'; 'The Missioner'; 'Jeanne of the Marshes'; 'The Illustrious Prince'; 'The Missing Delora'; 'The Falling Star'; 'Havoc'; 'Double Four'; 'Peter Ruff.' Later works include 'The Lighted Way' (1912); 'The Mischief Maker' (1913); 'The Way of these Women' (1914); 'The Amazing Partnership' (1914); 'The Game of Liberty' (1915); 'A Peoples' Man' (1916); 'Mr. Grex of Monte Carlo'; 'The Double Traitor'; 'The Hillman' (1917); 'The Wicked Marquis' (1919); 'The Curious Quest' (1919).

OPPENHEIM, James, American fiction writer: b. Saint Paul, Minn., 24 May 1882. He was a special student at Columbia University in 1901-03, and at the same time was assistant head worker at the Hudson Guild Settlement. He is well-known as a contributor of verse, short stories and articles to the leading American magazines. He edited, in 1916-17, the *Seven Arts Magazine*. Author of 'Doctor Rast' (1909); 'Wild Oats,' novel (1910); 'Pay Envelopes,' short stories (1911); 'The

Nine-Tenths,' novel (1911); 'Idle Wives' (1914); 'The Beloved' (1915); 'War and Laughter, poems (1916); 'The Book of Self,' poems (1917); 'The Solitary' (1919), etc.

OPPENHEIM, Lassa Francis Lawrence, Anglo-German international lawyer: b. Windekken, Prussia, 30 March 1858. He was educated at the universities of Göttingen, Heidelberg, Berlin and Leipzig. He was later lecturer and professor at the University of Freiburg, and in 1891 became professor at Basle. In 1895 he became lecturer at the University of London, and in 1908 he was appointed Whewell professor of international law at Cambridge University. He was naturalized a British subject in 1900. Author of 'Die Rechtsbeugungsverbrechen' (1886); 'Die Objekte des Verbrechens' (1894); 'Das Gewissen' (1898); 'The Science of International Law' (1908); 'The Future of International Law' (1911); 'The Panama Canal Conflict' (1913); 'The Collected Papers of John Westlake on Public International Law' (1914), etc.

OPPENHEIM, Nathan, American physician: b. Albany, N. Y., 17 Oct. 1865; d. 5 April 1916. A graduate of Harvard (1888), and of the College of Physicians and Surgeons (1891), he made a specialty of the diseases of children. He published in that field 'The Development of the Child' (1899); 'The Medical Diseases of Childhood' (1900); 'The Care of the Child in Health' (1901); 'Mental Growth and Conditions of Children' (1902).

OPPER, Frederick Burr, American illustrator: b. Madison, Ohio, 2 Jan. 1857. He left school at 14, worked in a newspaper office and then in a store in New York, soon succeeding in getting his humorous sketches published. He was employed upon the Frank Leslie publications three years, and was associated with *Puck* 1880-99. In the last named year he joined the staff of the New York *American*. He has published several of his series of humorous drawings in book form, and has illustrated humorous books by Bill Nye, Eugene Field, Mark Twain and others, an edition of 'Mother Goose,' 'Æsop's Fables,' etc.

OPPERT, öp'pért (Fr. ö-pär), Jules, French Orientalist: b. Hamburg, Germany, 9 July 1825; d. Paris, France, 21 Aug. 1905. He was educated for the law at Heidelberg, studied Oriental languages at Bonn and Berlin and philosophy at Kiel. His first literary work, 'Das Laut-system des Altpersischen,' was published in 1847, and in 1848 he accepted a professorship of German at the Lyceum of Laval and two years later he went to Rheims in the same capacity. He was a member of the expedition sent by the French government to Mesopotamia in 1851; and on his return he laid before the institute his system of deciphering Assyrian inscriptions. In 1857 he was appointed professor of Sanskrit at the schools of the National Library; in 1869 teacher of assyriology in the Collège de France, and in 1874 he became full professor of the same subject in the latter institution, receiving election to the Académie des Inscriptions in 1881. He published 'Les Inscriptions des Achéménides' (1852); 'Grande Inscription du Palais de Khorsbad' (1863); 'Le Peuple et la Langue des Mèdes' (1879); 'Etudes sumériennes' (1881); 'Le Calendrier perse' (1899).

OPPIAN, öp'i-an, Greek poet: b. (at Korylus or Anazarbus in Cilicia) in the 2d century A.D. He wrote a didactic poem of five books on Fishing 'Halieutica' in lively but often tumid diction, and with correct and polished versification. A good edition of the 'Halieutica,' the 'Cynegetica' (and a paraphrase) is by Lehrs (1846). Another poem on Hunting 'Cynegetica' has been falsely attributed to him; but the diction is rough and the verse halting, and the work is no doubt the production of a writer of the time of Caracalla, 3d century A.D., to whom it was dedicated. Internal evidence would seem to show that it was written about 212 A.D. by another Oppian who came from Apamea in Syria. Consult Miller, 'Oppians des Jüngern Gedicht von der Jagd' (1885). Consult Draper and Jones, 'The Halieutica' (Oxford 1722); Mawer, 'The Cynegetica' (London 1786); Bourguin, E. J., 'Halieutica' (1877).

OPPIUS, öp-pi-üz, Caius, Latin author and friend of Julius Cæsar. He, with L. Cornelius Balbus, had charge of affairs in Rome during the absence of Cæsar. Suetonius (Cæsar 56), asserts that Oppius was believed by many to have written the histories credited to Cæsar chronicling the events of the Spanish, African and Alexandrine wars. The contention is now considered unwarranted as Oppius was in Rome during these campaigns and the writer evidently participated in them. He wrote a life of Cæsar, and of Cassius and the elder Scipio, but these are lost. Consult Schanz, M., 'Geschichte der römischen Literatur'; Teuffel-Schwabe, 'History of Roman Literature'; Nipperly, 'De Supplementis Commentarium Cæsaris.'

OPPOSITION, in logic, opposition of judgments is the relation between any two which have the same matter, but a different form, the same subject and predicates, but a different quantity or quality. There are four kinds of opposition, namely, contradictory, contrary, subaltern and subcontrary. The following diagram illustrates what is known as the square of opposition.

The assertion of a proposition is equivalent to the denial of its contradictory. Contraries can both be false but cannot both be true. Subcontraries can both be true, but cannot both be false. A proposition implies the truth of its subaltern. The validity of the square of opposition depends on the preliminary assumption that some A, the subject of discourse, exists. For example, you cannot conclude that because

no mermaids live in the sea, some mermaids do not live in the sea. See LOGIC; LOGIC, SYMBOLIC.

In *politics*, the party who, under a constitutional government, are opposed to the existing administration, and who would probably come into power on its displacement. A fair and temperate opposition is a wholesome check upon the party in power, as it is for its interest to demonstrate the injustice, impracticability or insufficiency of the laws or proceedings of the government; but, on the other hand, the despatch of public business may be seriously delayed by the conduct of a factious or obstructive opposition.

In *astronomy*, the situation of two heavenly bodies when they are diametrically opposed to each other, or when their longitudes differ by 180° . Thus there is always an opposition of sun and moon at every full moon; also the moon, or a planet, is said to be in opposition to the sun when it passes the meridian at midnight. Signified by the symbol $\circ$; as $\circ$ the opposition of Jupiter to the sun.

OPS, Roman female divinity of plenty and fertility. She was supposed to make her abode on the earth as the protectress of agriculture, and was worshipped usually in the temple of Saturn, whose wife she was believed to be. Newly born children were especially recommended to her care, and her festivals were called Opalia (19 December) and Opiconsivia (25 August).

She shared the Saturnalia festival with Saturn. At the Opiconsivia celebration, which seems to have been of a priestly character only the vestals and one of the pontifices were permitted to be present. As the mother of Jupiter, Ops was honored with Jupiter himself on the capitol. Not far from the temple she had also an altar in common with Ceres.

OPSONIN, a term applied by Sir Almworth Wright to the substance which is believed to exercise an opsonic or seasoning action in blood serum, rendering bacteria susceptible to phagocytosis. Based upon the researches of Metchnikoff, who founded upon the phagocytosis process a theory of immunity to disease, the study of opsonin by Wright, Douglas and others led to the formulation of the opsonic index which furnishes a record of the condition of tubercular patients subjected to vaccine treatment. See PHAGOCYTOSIS.

OPTICAL ILLUSION. See ILLUSION.

OPTICAL IMAGES. See LIGHT.

OPTICAL LANTERN, the highest development and refinement of the magic lantern (q.v.). Like its progenitor, it consists essentially of a source of light of a brilliancy adequate to its designed use, a condensing system of lenses to gather and concentrate the light rays upon the object to be illuminated, and a projection system of lenses to magnify and define the enlarged image upon a screen or blank

wall. In the gathering of these essentials into one convenient instrument a general pattern prevails, but there are minor differences in the designs of the various manufacturers which do not, however, affect the working results in any considerable way.

Although its most common use is for the exhibition of transparent photographic pictures by transmitted light, in churches, halls and lodge rooms, the optical lantern is very largely employed in educational work for lectures in class-rooms. In the State of New York there is maintained as a part of the educational system a department of visual instruction possessing a collection of 300,000 educational lantern slides which are loaned free of charge to schools making proper application for them. Many individual schools throughout the State own an optical lantern, and make frequent use of the slides offered by the State department. A more scientific use of the optical lantern is in the study of the enlarged images of microscopical subjects and other scientific photographs. With suitable attachments it is possible to use the lantern to great advantage in the study of polarized light and in spectrum analysis.

The sources of light available for use in the optical lantern are practically two—the oxyhydrogen or calcium light, and the electric arc light. The calcium light (q.v.) will give adequate illumination for screen pictures up to 15 or 16 feet square, and under favorable conditions even to 18 feet square. From 18 up to 25 feet square no light is sufficient but the electric arc. In the latter case the direct current is almost a necessity. The alternating current can be used, but it is so noisy as to be offensive. The handling of the current and connections requires an operator conversant with electrical equipment, as many precautions must be taken. The strength of current best suited to use in the lantern is 50 volts, and the usual voltages of 110 volts and 220 volts should be reduced to 50 by a suitable rheostat. The brilliancy of the arc light as used in lanterns ranges up to 3,000 candle-power. In the case of the calcium light, the necessary oxygen and hydrogen gases are found on the market in most cities in cylinders in condensed form, under pressure of 225 pounds per square inch. The apparatus for burning these gases in the lantern is known as a jet. In the preferred form the gases are conducted separately to the two tubes of the jet, and pass through these tubes into a mixing chamber which is packed with wire gauze or finely perforated metal plates. From the mixing chamber projects a spout which delivers a jet of the mixed gases slantingly upward against a cylinder of lime about one-fourth of an inch distant.

The hydrogen gas is first turned on at the cylinder valve, and lighted at the jet. The oxygen gas is then admitted slowly into the jet, and the combustion of the hydrogen in the oxygen produces the intense heat necessary to render the lime cylinder incandescent. The impinging of the current of gas upon the lime wears it away gradually, and necessitates the revolving of a new face to the flame. The necessary paraphernalia for this movement forms a part of the jet. Another form of jet, known as the "blow-through" jet brings the hydrogen gas to the mouth of the spout in a ring-shaped

aperture, forming a conical flame, and the oxygen is delivered into the centre of this cone. With the blow-through jet a soft lime is required; with the mixed-gas jet the lime should be hard. The usual size of the lime cylinders is one inch in diameter. A somewhat larger picture may be forced when necessary by using a larger lime—up to one and one-half inches in diameter, but at the expense of equal sharpness in the picture, and a larger consumption of gas. While the electric light gives a more brilliant picture, the quality of the oxy-hydrogen light is more agreeable, being “warmer” and of a mellow character, where the electric light is “cold” and harsh. The brilliancy of the oxy-hydrogen light as used in the lantern is

convex lens with a plano-concave lens cemented on the rearward surface, the plane side toward the light. At the rear end of the mounting are two lenses set a very small distance apart—a double-convex lens toward the rear, and a thin concavo-convex lens in front of it, with its convex face toward the front. These lenses are graded according to the photographic plate with which they are commonly used in making portraits—as quarter-plate and half-plate lenses. The quarter-plate lens is used generally on lanterns, as it gives a 10-foot picture at 20 feet distance from the screen; and a 20-foot picture at 40 feet. These proportions are adaptable to the large majority of public halls, and to the average church and class-room. The

FIG. 1.

about 600 candle-power, and thence up to 800 candle-power under the most favorable conditions.

The light produced is gathered and concentrated by the condensers, a system of two or three lenses set from four to six inches from the source of light. This distance can be adjusted in the lantern by sliding the light mechanism forward or backward, as may be indicated by the circle of light thrown upon the screen. Where the condensing system is of two lenses, they are plano-convex lenses of four to four and one-half inches in diameter, their convex sides toward one another, and about three-fourths of an inch apart. Sometimes these lenses are set far enough apart to allow a glass cell filled with water to be inserted between them, to cut out heat rays which might damage the objects being shown—as in the case of living animalculæ. Where a third lens is added to the condensing system it is a concavo-convex lens, placed at the end of the condenser mount nearest the light, and with the concave side turned thereto. It is somewhat smaller as to diameter than the other two. There is much dispute among lanternists as to whether the third lens adds any advantage. It is useful in certain conditions, but it is an optical fact that every new lens added to an optical instrument reduces the amount of light passing through, unless it is joined to the others by cementation.

The projecting lenses are of the type known to photographers as portrait lenses. The combination is made up of four lenses in one tube or mounting. In the forward end is a double-

“third-plate” size, intermediate between the other two, is useful in the larger cities, where it is desirable to put the instrument in a gallery. Having a longer focus, it gives a smaller image on the screen as compared with the distance; an 8-foot picture at 20 feet; a 16-foot picture at 40 feet; a 24-foot picture at 60 feet. The standard for quality in projection lenses is the Darlot portrait lens, made in France. But the American lenses of the same type are at least fully as good.

Having provided these essentials, instrument makers vary the housing and the framework with which they are mounted for convenient use. The accompanying sketch in Figure 1 shows the customary arrangement for exhibition purposes. L is the lamp house showing the position of the carbons of the electric light, the horizontal carbon being placed accurately in the optical axis of the instrument. C is the three-lens condensing system, with a water cell, W, in place. S is the slot for the slide carrier. B is the light-tight bellows which allows the projection lens to be run back nearer to the light, for focussing. P is the projection system of lenses.

In Figure 2 is given a sectional diagram (in elevation) of the lantern used to project images of opaque objects. L, L, indicate the positions of the carbons in the two lamp houses; C, C, the two condensing systems for throwing parallel rays upon whatever object is placed upon the field (F). The projecting lens system (P) is of much larger aperture in proportion than with the ordinary optical lantern, as the image is made up of light rays reflected

from a surface more or less absorbent of light, instead of being the direct rays of the arc passing through a transparent medium. The rays forming the image pass upward through the projecting system and strike upon the tilting mirror M, being thence reflected to the screen. Both lanterns may be used for an intense illumination, or one may be used to give high

effects known as interference colors, shadows known as interference figures and the like. By these means it is possible to study very small mineral grains in a rock, and identify the minerals, when it would not be possible to recognize them in any other way. This study is known as Optical Mineralogy and it forms the basis of all microscopic study of rocks,

FIG. 2.—Elevational Diagram of Lantern for Projection of Opaque Objects.

relief, or the intensity of either lantern may be varied.

Attachments of several kinds are provided for educational work, including a moving picture apparatus, microscope, etc. See LANTERN SLIDES; MAGIC LANTERN; MOVING PICTURES. Consult Fraprie, F. R., 'How To Make Lantern Slides' (Boston 1918); Gage, S. H. and H. P., 'Optic Projection' (New York 1914); Niewenglowski, G. H., 'Traité Pratique des Projections Lumineuses' (Paris 1910); Norton, C. G., 'The Lantern and How to Use it' (London 1901).

OPTICAL MINERALOGY, the study of minerals by means of their optical properties, in other words by means of their effect on light. The minerals or rocks are ground into sections .03mm in thickness, in which condition most minerals are transparent. Each different mineral has its own peculiar effect on polarized light, especially as seen under the microscope. In some cases the minerals absorb rays of certain color more readily than others, or absorb certain rays more when the light passes through in one direction than in another. Some minerals have the power of breaking light up into an ordinary and an extraordinary ray, one of which travels faster than the other. This property, known as double refraction, possessed by certain minerals, produces a host of phenomena under the microscope, such as color

OPTICS. See LIGHT.

OPTIMISM (Lat. *optimus*, best), the opinion that this world, physically, socially and morally, is the best that could possibly exist. It is opposed to pessimism (Lat. *pessimus*, worst), the opinion that this is the worst possible world. The optimist looks upon existence as a great and unmixed good. Some advocates of optimism have maintained that while the Author of all things was not compelled to produce the best and happiest order to things, he has in fact actually done so, because the presence of evil teaches mankind to discern and choose the good, by striving through suffering and self-exertion to attain the blessedness which is within the reach of all alike. Other optimists reason *a priori* that it is impossible that God could produce anything that was not the best; that in spite of evil and suffering, it harmonizes with the idea of His perfect goodness to infer that the motive for the creation of man is stronger than that for non-creation, in that life affords means of enjoyment which are unquestionable and give the opportunity and capability of attaining perfection. The discussion as to the preponderance of good or evil in the world and their admixture was maintained by

the fathers of the Church and by the schoolmen. In modern philosophy optimistic tendencies have been exhibited by Descartes, Malebranche and Spinoza, but the full development of the theory was left to Leibnitz (q.v.); who in his 'Theodicée' elaborately expounds the thesis that the present world is the best possible creation, and the most perfect that omnipotence would produce. The word 'optimism' is also used to designate that attitude to life which always looks on the bright side of things, without necessarily involving any philosophic theory. That view which, without necessarily committing itself to the belief that this is the best of all possible worlds, believes that it exhibits a general tendency of improvement, or that it can be improved through our efforts, is known as *meliorism*. See PESSIMISM.

OPUNTIA. See PRICKLY PEAR.

QUASSA, or QUASKY, Trout. See TROUT.

ORACH, or ORACHE, a weed. See GOOSE-FOOT.

ORACLES, responses believed to be given by a deity to a worshipper or inquirer. There were in ancient Egypt oracular shrines, or oracles, as there were in many other countries; but by far the most celebrated were those of Greece. The oracle at Dodona, in Epirus, the oldest in Greece, appears to have originally belonged to the Pelasgians. Everything points to a native origin, but at a later period Egyptian influence produced important changes, notably the substitution of priestesses for the earlier male interpreters known as Selli. At this oracle Zeus himself was supposed to speak to men through the rustling of the leaves of a lofty oak (pointing back to primitive nature worship). Other forms of divination were introduced from time to time, such as the striking of metal basins. From Plato we learn that in his day the priestesses, following the example of those at Delphi, made their pronouncements in a state of religious frenzy. Dorimachus, an Ætolian general, razed the temple of Zeus here to the ground in 219 B.C., and the oracle appears never to have recovered from the blow. Not so old, but far more important, was the oracle of Apollo at Delphi, in Phocis, where the oracular declarations were made during a period of frenzy by the Pythian priestess seated on a tripod over a chasm from which a peculiar exhalation was supposed to issue. This was the chief national oracle of the whole Hellenic race, and its influence on Greek history must have been considerable. It was sometimes consulted also by foreigners. It attained the zenith of its power in the 6th century B.C., and from the time of Alexander the Great its influence was of little account. Other noteworthy oracles of Apollo were those at Abæ in Phocis, at Thebes in Bœotia, at Hysia in Bœotia, at Claros in Miletus, at Gryneia in the Æolian territory of Asia Minor, at Argos and at Delos. Oracles of other gods, such as Dionysus, Hermes and Pan, are mentioned, and there were also oracles of heroes such as Asclepius, Heracles, Trophonius (a famous one at Lebadea in Bœotia), Tiresias, Amphiaraus, Mopsus and Colchus. The spirits of the dead were supposed to utter oracular sayings in certain places, especially near Lake Aornos among the Thracians and at Tanarus in the south of La-

conia. In Italy the only oracles in the strict sense of the term were the temples of Fortune at Praeneste and Antium. The oracles were consulted at the outset of every great undertaking, such as the founding of a city or colony, the declaring of war or the conclusion of peace; but their responses were generally expressed in more or less ambiguous language. In an age when the principles governing the laws of nature were unknown and when superstition held its grip on the educated almost as firmly as on the illiterate, scarcely anything, however important or unimportant, was undertaken without consulting the oracles. The kings of Egypt, Assyria, Babylonia, Rome and Greece sought the advice of the oracles before undertaking any move of importance and biblical history shows the Jews, though disclaiming these heathen practices, placing faith in dreams and revelations which had their origin in the same source. Consult Bouché-Leclercq, 'Histoire de la Divination dans L'Antiquité' (1879-82); Myers, W. F. H., 'Greek Oracles' (London 1897); Farnell, L. R., 'Cults of the Greek States' (Oxford 1907); König, 'Das Orakelwesen im Alterthum' (1877); Schneider, 'Die Divinationen der Alten mit besonderer Rücksicht auf die Augurien der Römer' (1862).

ORAL HYGIENE. See HEALTH EDUCATION.

ORAN, ô-rân' (Fr. ô-rôn), Algeria, (1) a town, capital of the department of the same name and on a bay of the same designation in the Mediterranean, 209 miles by rail southwest of Algiers. It rises in the form of an amphitheatre, on the side of Mount Murdjadjo, has quite the appearance of a French town and is mostly modern. It is strongly fortified by works of recent construction. Among the buildings may be mentioned the cathedral, the grand mosque, the citadel or castle, the Kasbah or old citadel and the large military hospital. There are two harbors, an old or inner, 10 acres in area, and a new or outer of 60 acres area. The principal articles of export are esparto grass, cereals, wine, olives, tobacco, hides, skins, cigarettes and cattle. Pop. about 130,000, of whom three-fourths are Europeans. The town was built by the Moors. It was captured by the Spaniards in 1509, by the Turks in 1708 and again by the Spaniards in 1732. It was destroyed by an earthquake in 1791 and shortly after abandoned by the Spaniards. In 1831 it came into the possession of the French and has been developed by them into a large and prosperous town. (2) The department, forming a long belt along the Mediterranean, bounded on the east by the province of Algiers, south by the Sahara and west by Morocco, has an area of 25,650 square miles and a population of 1,231,000. Among the communes are Sidi bel Abbès, 31,000; Mostuganem, 24,000; Mascara, 25,000; and Tlemcèn, 40,000.

ORANGE, ôr'ênj, Prince of. See WILLIAM THE SILENT, PRINCE OF ORANGE; WILLIAM III, KING OF ENGLAND; MAURICE OF NASSAU.

ORANGE, Cal., city in Orange County, 30 miles southeast of Los Angeles, near the Santa Sua River, and on the Southern Pacific and the Atchison, Topeka and Santa Fé railroads. The city is situated in a productive fruit region and

has canneries, packing plants and other establishments connected with the fruit industry. Poultry raising is also being developed extensively. Pop. (1920) 4,884.

ORANGE, Conn., town in New Haven County, near Long Island Sound, and on the Housatonic River, six miles southwest of New Haven, on the New York, New Haven and Hartford Railroad. The town is the centre of a productive agricultural region and manufactures automobiles. Pop. 13,094.

ORANGE, Mass., town, Franklin County, on Miller's River and on the Fitchburg Railroad, 37 miles north-northeast of Springfield. The town includes the villages of Orange, North Orange and Tully. The town was incorporated in 1810. The surface is very uneven, the village of Orange being built on a hill that rises abruptly from the river. Orange is one of the most enterprising manufacturing towns of the county. The manufactures include sewing machines, motor-carriages, water-wheels and other machinery, furniture, boxes, shoes and clothing. It has three handsome parks and a public library. Pop. (1920) 5,393.

ORANGE, N. J., city in Essex County, on the Delaware, Lackawanna and Western and the Erie railroads, about four miles west by north of Newark. It has electric railroad connections with Newark, Jersey City, East Orange, South Orange, Bloomfield, Montclair and other cities and towns in the vicinity. Orange was settled about 1666 by a colony from Connecticut. At first it was a part of Newark and was called "Newark Mountain." The residents of "Newark Mountain," in 1718, established a separate church, and the organization was known as "The Mountain Society." This same church was known in 1781 as the "Second Church of Newark," and now (1904) as the "First Presbyterian Church of Orange." In 1790 a further separation took place, and the place was called Orange Dale. In 1806 Orange became a separate town, incorporated under the name of Orange. Other divisions were made and South, West and East Orange were established in the years 1861, 1862 and 1863, respectively.

Orange is on an elevation, the lower slope of Watchung Mountain, a ridge extending northeast and southwest, rising in some places 650 feet above tidewater. The town itself is from 150 to 200 feet above sea-level. Adjoining the city or in the near vicinity are Hemlock Falls, in South Orange; Llewellyn Park, which contains 750 acres, and many fine residences, West Orange. Eagle Rock, an eastern crest of the mountain, is now within the limits of the Essex County Park System. The city and vicinity have miles and miles of good roads, many shade trees and long lines of well-kept hedges. Orange and all the "Oranges" are residential sections for New York business men, many of whom have their homes there, while others remain only during the summer months. The city has considerable manufacturing interests, among which are hat factories, for which Orange is noted, printing plants, lawn mower establishments, breweries and chemical laboratories and the Edison laboratory near Llewellyn Park. The number of employees in the manufactories is about 5,000. The city has an extensive trade in hats and considerable trade in other manufactures and fruit. Some

of the prominent buildings are the Metropolitan building, Music Hall, Masonic Temple, Decker building, the "First Presbyterian Church," already mentioned, the original still standing, but several times remodeled, and the church, school and library buildings. It has a House of the Good Shepherd, an orphanage and the Orange Memorial Hospital. The educational institutions are public and parish schools, the Stickler Memorial library, a city library, the Orange Training School for Nurses, and at South Orange, Seton Hall College, a Roman Catholic institution for boys and men. The Locke College for Boys and other private schools are in the "Oranges." There are 20 churches, representing a number of denominations. The city has a number of organizations whose objects are educational and charitable, as the Mendelssohn Union, a Bureau of Associated Charities, a New England Society and several literary societies. It has also a number of athletic and social clubs. The government, administered under a revised charter of 1879, is vested in a mayor and council, who appoint or elect the administrative officials, except the board of education, which is chosen by popular vote. The city owns and operates the waterworks. Pop. (1920) 33,239. Consult Wickes, 'History of the Oranges from 1666 to 1806' (1892); Whittemore, 'The Founders and Builders of the Oranges' (1896).

ORANGE, Tex., city, county-seat of Orange County, on the Sabine River, at the head of navigation, and on the Orange and North-western and the Southern Pacific railroads, 85 miles northeast of Galveston and 20 miles east of Beaumont. It is the shipping centre for the surrounding region, exporting rice, cotton, sugar and livestock. It has several large lumber mills, shingle and saw mills, and also oil, paper, cotton gins and a rice mill. The public schools include a high school for the colored race. The city owns and operates the waterworks. Pop. (1920) 9,212.

ORANGE, Fort, a former fort built in 1623, on the site of the present city of Albany, N. Y. It was erected by the Dutch as a defense work against the Indians.

ORANGE CITY, Iowa, town, county-seat of Sioux County, on the Chicago and North-western Railroad, 40 miles north-northeast of Sioux City. It is in an agricultural and stock-raising district. Its most notable public building is the county courthouse. It is the seat of the Northwestern Classical Academy (coeducational), founded in 1882 under the auspices of the Reformed Church. Pop. (1920) 1,632.

ORANGE FREE STATE, Province of the, South Africa, early known as ORANGE RIVER COLONY and from 1854 as ORANGE FREE STATE, in 1900 was annexed by Great Britain after joining in the Boer invasion. On 20 Sept. 1909 it was made part of the Union of South Africa (q.v.). It is bounded on the north by the Transvaal, east by Natal, southeast, south and southwest by Basutoland and Cape Colony, and west and northwest by Griqualand West and South Bechuanaland. Area, over 50,000 square miles, divided into 19 districts. Capital, Bloemfontein (q.v.) connected by rail with Cape Town and Port Elizabeth, and also with the

Transvaal and Natal. The country generally consists of vast undulating plains, lying 3,000 to 4,000 feet above sea-level affording good pasture lands, and interspersed in many places with rocky hills called kopjes. The country is cold in winter, and in summer is liable to violent thunderstorms and long droughts; the climate, however, is generally healthful. The rivers that intersect the country are all small, and the boundary rivers, the Vaal and Orange, are unavailable for traffic. Agriculture and pasturing are the chief occupations, and wool, hides and ostrich feathers the principal exports. Grazing is still the chief industry of the state, but agriculture is becoming yearly of more importance. Among the agricultural products which are growing in output from year to year are wheat, oats, corn, potatoes and tobacco. Of these corn is by far the most important crop, amounting, in normal times, to over 7,000,000 bushels. Some 35,000,000 pounds of wool are produced yearly. Diamonds and other precious stones have been found in paying quantities, rich coal mines exist, and the state is said to abound in other mineral wealth. Gold was discovered in 1887. The diamond mines are at Koffyfontein, Jagersfontein and in the neighborhood of Kroonstad. The value of the diamonds mined in the state is over \$7,000,000 a year.

The state has about 1,200 miles of railway which traverse the middle of the country, southwest and northeast from border near Colesberg to the Transvaal border at Vereeniging. Branch lines connect the trunk line with the Natal system, Frankfort and other points.

As a member of the Union of South Africa, the Orange Free State has an elective provisional council of 25 members with power to legislate on all local matters not affecting the Union as a whole, the executive committee of four members selected by the provisional council and an administrator appointed by the governor-general. The state is represented in the House of Assembly of the Union by 17 members. The government aided schools number somewhat less than 1,000; at all of which fees are charged.

Prior to 1836 this region was inhabited by Bushmen, Bechuanas and Zulus. The colony was founded in 1835-36 by Dutch settlers from Cape Colony. It was annexed by Great Britain in 1848 in order to put a stop to the Boer outrages on natives; but in 1854 it was recognized as an independent state. The language of the country is a Dutch dialect, and the Dutch Reformed Church is the dominant religion. Under its independent régime the executive was entrusted to a president elected for a period of five years by universal suffrage; while the volksraad or parliament, elected for four years, exercised legislative functions. The history of the Orange Free State till 1899 was one of steady, peaceful progress, interrupted by hardly any stirring event, except some fighting with the Basutos down till 1869, and a more serious quarrel with the British government in 1871 concerning the Kimberley region. The latter dispute was settled by arbitration, under which the British government agreed to pay £90,000 to the Free State as compensation for its loss. In 1889 the state was admitted into the Customs Union of South Africa, and in that year also

the railway from the Orange through Bloemfontein to the Vaal was completed. The greatest president of the state was Johannes Hendrikus Brand, afterward knighted as Sir John Henry Brand, who held office from 1863 till 1888. His successor was Francis William Reitz, who was latterly state secretary of the Transvaal republic. The last president of the state was M. T. Steyn, elected in 1896 and re-elected in 1901. In 1897 an alliance with the Transvaal for mutual defense was confirmed. When the war between Great Britain and the Transvaal broke out in October 1899 the Free State Raad decided to stand by its alliance treaty, and joined the Transvaal in the invasion of British territory. After the state had been invaded from the west and Bloemfontein occupied, it was annexed to the British Empire under the name of Orange River Colony, by proclamation of date 28 May 1900.

In 1907 self-government was granted and this was maintained until 31 May 1910, when the colony was consolidated in the Union of South Africa as the province of the Orange Free State. Pop. about 200,000 whites, 360,000 colored, most of the latter being Bantus; total 560,000. See SOUTH AFRICAN WAR.

ORANGE INDUSTRY, The. In international commerce the orange is the most important fruit marketed in the fresh state. It is grown in warm parts of all the continents and enters important market channels from two—Europe and North America, while in the popular mind the apple is doubtless placed first it occupies a secondary place because in only North America and Australia is it planted on a large commercial scale and its fruit goes mainly to temperate climate markets whereas the orange commands a market range from the equator to the limits of civilization. The grape, fresh, dried as raisins, manufactured as wine, juice and jelly, has always been and is still greater in the value of its contribution to commerce and in the distance it safely traverses, but the grape rules not as a fruit, but through its manufactured products, while the orange carries its natural beauty, fragrance and flavor unchanged around the world. The date is also an important rival as a world food, but its use, though worldwide, is more important in countries where it is indigenous. From the earliest times the orange has not only been accepted in northern climes as an expressive exponent of tropical and subtropical salubrity, but by its own distinctive characteristics as a fruit it has won recognition as befitting the highest uses of mankind. By its nature, too, the orange ministers to its own commercial popularity. It endures long shipment; it ripens slowly and through a season of several months which con-

stitute the winter in northern latitudes when local fruits are scant or absent and the refreshment in the citric juices most welcome. The production of such a commercial commodity has from the earliest times constituted an important industry.

Though the orange thrives in the tropics it will withstand a few degrees—seven is the lowest record in Florida—below freezing point; but where frost is likely to occur the risk is considered too great for commercial ventures.

The fruit grown in semi-tropical countries, especially those which have a more or less distinctly marked two-season climate, differs in character from the strictly tropical orange. It is firmer, heavier, more sprightly in flavor and has much better keeping and carrying qualities. The tropical orange has but small commercial importance; the semi-tropical orange rules in the markets of the world. That the semi-tropical orange should have this distinctive character is most fortunate, for it ministers directly to the will for industry which is superior in semi-tropical countries.

Thus its ability to withstand slight frosts of short duration has enabled it to supply a market range of 70° of north latitude and more than 50° of south. Though the tropical orange might reach most distant markets in small quantities, it could never attain the commercial supremacy which the fruit now enjoys.

The sweet orange, which is the species from which commercial varieties have been developed, is a native of eastern Asia whence it was carried to India, to Asia Minor and to Mediterranean countries especially in southern Europe. It possibly reached Portugal from India through the early Portuguese navigators. Thus the distribution of the fruit was westward. The history of modern commercial orange growing consists of a series of progressive movements always trending westward and gaining in volume—the newer centres of production outstripping the older and ultimately largely displacing their product in the greatest markets of the upper divisions of the Temperate zone. When the Moors introduced orange growing into Algeria and Spain they displaced the traffic from Asia Minor and gave the Mediterranean region for several hundred years undisputed possession of the markets of the north of Europe and possession also of the American demand when that arose. When the Spaniards and Portuguese carried the orange to the West Indies and to Florida they laid the foundation for an industry which American enterprise developed in Florida until that district not only contended with the Mediterranean region for American markets, but was planning to invade northern Europe by direct shiploads, but the demonstration came that the climate of northern Florida and of the Gulf Coast westward was too treacherous for commercial ventures in orange-growing—at least with the popular varieties and proved methods of propagation.

When the Florida supply failed through the severe freezing of 1894-95, California came forward and is now not only supplying four-fifths of the oranges consumed in the United States, but is selling the highest priced oranges in the London market against a world of competitors. This competition with the product of California

is working hardship in the Mediterranean region because that region can more than supply Europe and needs American markets as an outlet. Italy has exported \$6,000,000 worth of oranges and lemons in a year, but since the first of this century prices have declined and the interest is depressed. Every effort is being made to secure relief from local taxation and from duties imposed by north European countries. The Spanish product of oranges and lemons, which ranks next to the Italian, has to meet heavy tariffs in all countries except the United Kingdom and the belief at Valencia as far back as 1902 was ('U. S. Commercial Relations,' Vol. 2, 1902, page 686) that the limit of British markets' consumption of Valencia oranges at paying rates has been reached; in fact, the British markets collapsed under the heavy shipments of 1901. When it is stated that the value of oranges imported into the United Kingdom in 1900 was \$10,603,950 and such a free buyer has more than enough, it can be realized how important it is to the Mediterranean producers that the populous countries of central Europe should hold less strictly to agrarian interests which aim to hamper the entrance of food supplies even if they cannot themselves produce them. Manifestly the American product can enter such markets only with a fancy product which will win an extra price, except as a little difference in the ripening season may afford an opportunity.

The commercial position of the orange in the United States is also such as to awaken apprehension. The present strength of the situation lies in the protective tariff and the *bête noir* of growers is the possibility of making gaps in it by reciprocity treaties. The product of the West Indies is a direct menace to the Florida product, which meets it in point of market season and the Mexican product, which is undergoing expansion at the hands of American capitalists, is constantly feared by the California growers because the Mexican railway will give it quick entrance to the great central States and consequent advantage in distribution to the East and the Northwest. The orange from the West Indies and South Florida is different from the California orange in main ripening season and in character of the fruit, but the differences do not give full relief. With the late ripening varieties, the California grower extends his shipments into the autumn and thus laps upon the early fruit from Florida and Jamaica, while the parts of California which bring earliest maturity to the fruit are shipping before the southern fruit is cleared away. In fact, California of itself can keep the markets supplied with oranges fresh from the trees and in prime condition the year around.

As to the difference in oranges grown under humid and arid conditions, the moisture being supplied by rainfall in one case and by irrigation in the other, the arid-region orange shows superior density, thinness and texture of rind, higher sugar and acid percentages and a more sprightly or vinous flavor. The popular conception of the superior sweetness of the orange grown in humid countries is due both to a greater amount of sugar in the juice and to a less amount of acid; for determinations of sugar and acid in fully ripe navel oranges grown in southern California and in Florida

show the former to contain approximately 10 per cent of sugar and $1\frac{1}{2}$ per cent of acid, whereas the latter contains about 2 per cent less sugar and scarcely 1 per cent of acid.

The quality of an orange is largely inherent in the variety, but all varieties are similarly changed by growth under humid or arid conditions of climate and soil and this modification becomes a factor of much industrial importance. This fact is strikingly illustrated in California by the standing of the navel orange which has been grown for a century or more as the chief orange in Bahia, Brazil, whence it was imported. In Brazil it demonstrated no shipping qualities and according to Burke ('U. S. Special Consular Reports,' Vol. I, p. 411) would need to be picked before maturity if to be shipped, while, as grown in California and Arizona, it is picked at full maturity and is successfully shipped all over the United States and to Europe.

Orange growing in Florida has recovered from the serious reverses prior to 1900. The product of 1894 was about 6,000,000 boxes. Then came the disastrous freezing in December of 1894 and February 1895, with a temperature of 14° F. at Jacksonville. In the latter year only 75,000 boxes were shipped. In 1903 the product was about 900,000 boxes. Confidence is being restored by the safety of the trees in the southern half of the State and by the promising results of trial of hardier varieties in the older citrus district in the northern part.

In Louisiana the freezing of 1895 nearly annihilated the citrus fruit interest. Not until about 1910 was there evident a disposition to resume production on a commercial scale. In the Gulf parts of southwestern Texas and in the southwestern corner of Arizona the navel orange is being grown on a small business scale for shipping to distant markets. Conditions favor early ripening and an advantage is secured by sale in advance of the main California product. From California the shipments of oranges beyond State lines in 1913-14 were over 48,500 carloads. This is the largest crop in the history of the State, though the season of 1910-11 approached it with nearly 46,400 carloads. Only in two other years has the crop exceeded 40,000 carloads.

Planting during the last two decades has been very active. It is estimated that in 1915 the California citrus industry, including grape fruit, lemons, etc., represented a capital of \$200,000,000, a labor employment of 40,000 people and an area of 200,000 acres. The orange is by far the most important of the fruits represented by these figures. The orange industry of the United States is now largely supplying the home demand for the fruit. Imports of oranges reached their highest value in 1883 at \$3,010,662 and have since then declined. The value in 1910 was \$82,546, of which one-half came from the British West Indies; a quarter from Italy and an eighth from Mexico.

The orange industry of the United States is unique in the high social and financial standing of those who have engaged in it and in the striking features of its development. Both in Florida and in California large scale production was first undertaken by northern men who had gained wealth and had lost health in pursuit of it. They brought capital and commercial ability to the ventures which they exploited. The professional classes of the North also par-

ticipated largely in the work, bringing scholarship, insight and experience in organization. There were a few also who possessed horticultural experience, but the other classes largely predominated. The result has been the development of an industry characteristically American in spirit and new in methods. It has borrowed very little from the practices of Old World orange growers. Free from tradition and prejudice, it proceeded rapidly upon the results of original investigation and experiment, establishing a system of culture and of commercial handling of the product which are without precedent in the older orange regions of the world. For the care of the orange orchard, see ORANGE AND ORANGE CULTURE.

ORANGE-MELON, a sort of muskmelon. See MELONS.

ORANGE OIL, an essential oil obtained from the rinds of oranges and used in manufacturing perfumes and liquors. The oil is extracted either by distillation or by expression, generally under warm water. The oil, being lighter than the water, rises to the surface, from which it is skimmed off. Another method of extraction is to press the peel of the fruit against a flat sponge which absorbs the oil as it exudes from the broken cells. Orange oil consists of over 90 per cent limonene or terpene with small amounts of citrol, citronellol and other component parts. It is usually of a pale yellow color, of specific gravity between 0.846 and 0.853. The greater part of the orange oil of commerce comes from Italy, Sicily or Southern France—orange-flower water is produced by steam distillation and has a specific gravity of 0.87 to 0.88; while orange-leaf varies from 0.885 to 0.900.

ORANGE AND ORANGE CULTURE, various species of the genus *Citrus* (family *Rutaceae*), and their fruits. The most important species is the sweet orange (*C. Sinensis*) which is the parent of most of the commercial varieties. It is a small, branching long-lived tree or shrub, with oval or elliptical, evergreen, apparently simple but really compound leaves and very fragrant white flowers. The fruits are globular or elliptical, and vary considerably in size. Botanically considered they are berries divided into 8 or 10 cells (locules) filled with a juicy and more or less acid pulp. The tough, yellow rind is valued, especially in some varieties, for its oil, which is extracted for use in flavoring and in perfumery. The flowers also are employed in decoration and worn as a significant ornament, especially by the bride, at her wedding. But it is as a dessert fruit, and for the manufacture of preserves, marmalade, etc., that the orange is of chief importance. For these purposes the tree has been taken from its presumably native home in southeastern Asia to all tropical and sub-tropical climates in the civilized world, and is cultivated extensively in many places not only to supply the local demands, but for the shipment of its fruits to climates beyond its range of cultivation. See ORANGE INDUSTRY.

In the United States the two important commercial regions of orange growing are Florida and southern California. In the former the region of successful cultivation has been restricted by experience of killing frosts to the southern counties, although previous to 1894 the

ORANGE, FRUIT, LEAF AND BLOSSOM

orange-growing region extended over most of the peninsular parts of the State. In many places the trees were growing wild when the State was settled, and it is surmised that these trees were the progeny of specimens introduced by the Spaniards in the early days. A third region is the delta of the Mississippi River. Parts of southwestern Texas and southwestern Arizona have been found suitable to commercial orange culture.

The species mentioned above has developed several well-marked botanical varieties, each of which has more or less horticultural forms. The most important botanical variety is *sinesis*, which is the immediate parent of the common sweet orange, and the Portugal or Malta orange. In the United States about 80 of the numerous varieties are cultivated, though those of commercial importance are scarcely more than a score.

They are characterized by usually round fruits, which are generally sweet or slightly acid, and have a sweet aromatic skin highly valued in cookery for flavoring. Their juice makes a superior wine. To this group belong the famous Bahia or navel varieties, which are extensively cultivated in California, and usually are seedless. The initial trees, originally native to Brazil, were introduced in 1870 by William Saunders of the United States Department of Agriculture at Washington, and distributed throughout the orange-growing sections of the country. It is, therefore, often called the Washington navel. Its peculiar formation is due to the development of a secondary axis with more or less cells in the centre of the fruit. The cause of this freakish development is unknown.

The bitter, sour or Seville orange (variety *aurantium*) is so named from its pulp. Though it is thoroughly naturalized in Florida from early Spanish importations, few of its horticultural varieties are cultivated in the United States, except as a stock upon which to bud varieties of sweet orange, lemon and pomelo,—a use for which they seem especially well fitted. In Spain, especially in the neighborhood of Seville, this species is extensively cultivated for shipment to Great Britain, where its chief use is in the making of marmalade. The flowers, immature fruits and young twigs of this variety are extensively employed in the manufacture of an ethereal oil, and the skin of the ripe fruit in making Bigaradia oil. In Southern France the flowers are widely used for making perfumery. The Bergamot orange (variety *bergamia*) is a small tree or shrub rarely seen in the United States, but cultivated in Europe for more than 200 years. The rind of the fruit furnishes Bergamot Oil, which is largely used in the manufacture of eau de cologne and other perfumes. The mandarin, or tangerine orange (variety *deliciosa*) is a very small tree or shrub with dense foliage and small fruits most noted for the looseness of the skin which is barely attached to the pulp. Because of easy removal of the pulp it has received its commonest name—kid-glove orange. Its varieties are gaining in popularity in the United States. The Otaheite orange (variety *taitensis*) is not, as its common name implies, a native of Tahiti but is probably either a variety of the common sweet orange or a hybrid between two other species of citrus, possibly

the lemon and the orange. It is a very popular pot-plant in greenhouses, on account of its diminutive size, free blooming and fruiting qualities. The fruits have a mawkish flavor. The king orange (variety *nobilis*) is a native of China whence it was introduced to California in 1880. Its large very juicy vinous flavored fruits are gradually becoming popular in spite of their rough skins. The Satsuma or onshiu orange (variety *unshiu*), a Japanese group of varieties, was introduced into Florida in 1876 but until recently has been rather quiescent. But since it is one of the hardiest of all edible oranges it is steadily becoming popular commercially in the Gulf States, especially when grafted upon stocks of the trifoliate orange. The Calamondin orange (variety *mitis*) a native of the Philippine Islands and popularly grown in Hawaii under the name of China orange, has been introduced into the Gulf States where it has proved very hardy but useful only as a home fruit. The three-leaved or trifoliate orange (*Poncirus trifoliata*) is a small thorny Japanese tree, whose chief use is as a hedge-plant. It is hardy as far north as New York, and is popular southward. Its small yellow downy juiceless, bitter, sour fruits are sometimes used in preserves. The plant is also valued as a stock upon which to bud various citrus fruits, especially the kumquat (kin-kin, or kin-kits, *Fortunella margarita*) and the Satsuma orange, a variety of mandarin orange. When used as grafting stock it is said to make the more tender varieties somewhat hardier and to reduce the size of the larger growing sorts. By hybridizing it with various species of citrus several promising hardy varieties have been produced, but so far have not been cultivated commercially. The Osage orange (*Maclura pomifera*) is a member of the family *Moraceæ*. It is therefore not properly an orange at all. See OSAGE ORANGE.

The orange was formerly propagated almost wholly by means of seeds, but since the sweet orange varieties so produced seemed to be seriously affected with root-disease ("foot-rot") and were variable both in habit of growth and value of fruit, propagation by means of buds has very largely replaced the more primitive methods. The stocks preferred in Florida and the Gulf States are the Seville and trifoliate orange and the so-called "rough lemon," apparently a natural hybrid, which resembles the lemon in foliage and flower, but whose fruit looks like the sour orange, being large, round and distinctly acid. These stocks are grown from seed, and when the seedlings are of suitable size they are budded with the desired variety. After growing in the nursery for a year, after being budded, the trees may be set in the orchard. The distances usually chosen vary between 25 and 30 feet, but varieties upon trifoliate stock may be set closer together.

When transplanted the tops are rather severely cut back so as to balance the loss of root in digging; and to check evaporation the ground is frequently covered with a mulch of straw, pine needles or other loose material. Clean cultivation is also given from the time the orchard is set, at least during the growing and dry season, followed by the sowing of some cover-crop, which will enrich the soil. This crop may be cut for hay, but its equivalent in such cases should be returned to the land in

the form of fertilizer and humus. Fertilizers should be applied liberally because the orange is a gross feeder.

There are several conditions essential to success in orange growing: soil, naturally rich or generously fertilized; temperature, suitable not alone to the life of the tree, but to the soundness and quality of the fruit; moisture, constantly available in adequate quantity, but not in excess; cultivation, to promote root growth by aeration and distribution of moisture; pruning to promote adequate wood growth and leaf action; protection from destructive insects and fungi. The soils which best befit the tree are deep loams with a good amount of clay, although the tree is not fastidious about soil-texture if plant food and moisture are ample. In Florida the orange soils are predominantly light at the surface and are largely sustained by regular fertilization, but a firm subsoil, for moisture retention within reach of the deeper roots and yet with drainage to obviate standing water renders light soil acceptable. A leachy subsoil, as for instance a deep sand stratum, is undesirable. In California the soils chiefly used for the oranges are clay loams of considerable depth without change in character and which are, therefore, of more enduring richness, but even the best and deepest soils in California are now showing the need of fertilizers to meet the heavy draft of the fruiting trees.

The orange tree is in danger whenever the temperature reaches the freezing point. The degree attained must, however, always be considered in connection with the length of time it prevails: for instance, four degrees of frost for an hour may do less harm than two degrees for two hours. As the temperature falls lower the duration becomes less important. Five degrees of frost for a very brief interval may injure the ripening fruit and the tenderer leaf growth; 10° will ruin the fruit and considerably injure the tree. A temperature of 20° F., or a little less, may kill younger trees to the ground and older trees to the stump, while 14° F. in Florida in 1895 killed to the ground trees some of which were more than half a century old. The root, however, escapes destruction and will send up new shoots provided the injured top is soon removed.

Where the temperature does not fall below 25 degrees injury has been successfully averted by burning numerous small fires among the trees. In California systematic use of electric-alarm bells connected with thermometers to arouse the sleeping workmen and the lighting of small pots of crude petroleum have saved the fruit from injury by six degrees of frost. Such protection has been demonstrated to be profitable in places where such frosts are to be expected. The occurrence of frost is local in California and is not conditioned upon latitude. Oranges are successfully grown in suitable locations between lat. 32° and 40° N.—nearly 500 miles of distance, and the extreme low temperature is practically the same at about the same elevation throughout this distance. It is also true that owing to the intervention of high ranges of mountains giving protection from cold currents of air from the north and northwest, the season is earlier at the north than at the south, and the oranges from northern and central California are marketed in advance of the main crop from southern California—the

fruit being marketed previous to the time of the lowest temperatures (December and January).

Oranges are grown with moisture from rainfall in Florida, while in Arizona and California irrigation is essential. Even in parts of California where deciduous trees fruit satisfactorily without it, the orange must be irrigated. The amount of water depends upon the age of the trees, the depth and retentiveness of the soil, the local rainfall, etc. The average amount is an annual total of 15 inches depth of water over the whole surface of the land occupied by the trees, and the application is made in fractions at intervals of about three weeks during the dry season. Upon the lighter soils the land is laid off for each irrigation by low levees or dykes into squares enclosing one or several trees, according to the slope of the ground, and these squares are filled from an adjacent ditch. In the heavier soils where the water can be distributed well by lateral seepage, the water is turned into several parallel furrows plowed between the rows of trees and is allowed to run in small streams for 24 hours or more.

Cultivation follows irrigation as soon as the ground has dried sufficiently to work well, for the purpose of preventing the surface from baking and preventing also the loss of moisture by evaporation. Thus the surface soil of a California orange orchard is kept constantly clean and mellow. No growth of weeds or other plants is permitted except when crops of legumes for plowing under green, to promote friability and to increase the humus-content of the soil, are undertaken. This cultivation of the surface promotes deeper rooting of the tree and aeration of the lower soil layers and the general thrift of the tree. California experience amply proves that irrigation and fertilization, unaccompanied by thorough and adequately deep cultivation, do not secure the best results.

The orange tree requires only light pruning after its proper shape is attained, but pruning to maintain the shape and to prevent the foliage from becoming too densely matted is essential. Pruning for shape has been more definitely pursued in California than elsewhere. The trees are grown with very short trunks; in fact, the lowest branches almost touch the ground. Cultivation is extended a certain distance beneath the tree by having a lateral extension to the cultivator. The men and teams never pass under the trees. The trees are encouraged to enclose themselves with a solid wall of foliage and all the work upon the tree and gathering of fruit is done with stepladders in the spaces between the trees. It would be well-nigh impossible to climb into the branches of such an orange tree, nor is it ever expected to do so. The trees are generally bluntly-conical or pyramidal in form, though some prefer a more roundish outline. The trees of the varieties most largely grown are low and of a semi-dwarf stature; only a few seedling trees of 30 feet or more in height are now to be seen.

Orange trees continue to bear, with reasonable care and under favorable conditions, for many years, reaching profitable age in some cases when less than six years old. The trees bear more or less continuously, flowers and fruits in all stages of development being found upon the same tree throughout the year. The

great mass of fruit, however, becomes ripe at one time. When ready for harvest the individual fruits are cut off with scissors, not pulled from the trees. They are then allowed to stand for a few days to dry and soften somewhat before being graded and boxed for shipment. Each fruit is wrapped in tissue paper before being packed. The standard orange-box contains two cubic feet and usually holds about 200 oranges. Large specimens occasionally reduce the number below 100, and small ones increase it to more than 250. When properly managed both before packing and during shipment the fruits should keep for several months.

Among the difficulties in orange growing are several so-called diseases which also attack other cultivated members of the genus *Citrus*. Perhaps the most widely distributed and troublesome is the "foot-rot," which seems to be worst upon sweet oranges and lemons. It is feared in Australia, Europe, California and Florida, in the last-named region having caused annual losses of \$100,000 or more. Though its origin has not been satisfactorily explained, it is readily recognized by the abundant exudations of gum near the ground, the yellow leaves reduced in size and number, the dry, peeling bark and the dead twigs. Ultimately the trees become girdled and die. Good drainage, resistant stocks, the avoidance of over-cultivation and stimulation with nitrogenous manures have been found the most satisfactory preventives. The removal of soil from the base of the trunk has been recommended as a remedy.

Blight is another little understood affection. Only bearing trees seem to be troubled by it. The leaves wilt even in moist weather; water-sprouts are produced in profusion on the trunk and main branches, but live only one or two seasons; the trees blossom abundantly the season after the wilting, but fruit fails to set and very little reaches maturity. The result is always fatal, even when only a small branch is originally affected. Scab, attributed to a species of fungus (*Cladosporium*), appears as excrescences upon the fruit and foliage. It is considered most troublesome upon lemons, and four or five applications of ammoniacal solution of copper carbonate is recommended as a remedy. (See FUNGICIDES).

"Die-back" is among the most troublesome pests of Florida orange orchards. It seems to be due to imperfect drainage and improper cultivation, which are succeeded by imperfect nutrition. Hence, improved drainage, cessation of cultivation, withholding nitrogenous manures and reducing the present content of such foods in the soil by cropping the orchards with nitrogen-consuming crops such as grass, have all been urged as remedies. Mulching is also recommended. The characteristics of this trouble are the dying back of the tips of the twigs, reduction in the "set" of fruit, premature ripening, splitting and shedding of the fruit. These characteristics may be seen in trees of all ages and varieties. The sooty mold (*Meliola camelliae*), which also appears upon many other kinds of trees, is not a disease, but because of its presence in abundance may prevent adequate aeration of the leaves. It is a mold that lives upon the honey-dew (q.v.) which is exuded by various species of insects (see APHID), which may be held in check by various insecticides,

notably resin washes and hydrocyanic acid gas. It often covers the fruit with a felty mass which precludes sale.

Melanose, stem-end rot and wither tip or anthracnose are fungous diseases generally kept in check by good orchard sanitation, removal of diseased fruit, pruning and destruction of injured wood, and by spraying with Bordeaux mixture. Citrus canker, a bacterial disease, is caused by *Pseudomonas citri*. In Florida it has been very threatening, but by burning the affected trees where they stand it is being held in check.

Among the numerous insects that feed upon the orange are several caterpillars, the most prominent of which are perhaps the orange dog, the caterpillar of a butterfly (*Papilio cresphontes*), the saddleback caterpillar (*Empretia stimulea*) and the bag-worm (*Oiketicus abbotii*). The cotton-stainer or red-bug (*Dysdercus suturellus*) and the leaf-footed bug (*Leptoglossus phyllopus*) puncture the fruit. The Morellos orange-worm, the maggot of a fruit-fly (*Trypeta ludens*), does great damage in Mexican orchards, and its possible introduction is dreaded by American orchardists, because the maggots destroy the fruit by tunneling in it. Several species of leaf-rollers and sucking bugs are troublesome, as are also various species of aphids, notably the orange aphid (*Siphonophora citrifolia*). In Florida and somewhat in Louisiana the white fly (*Aleyrodes citri*) is sometimes so abundant upon the foliage as to impair aeration of the leaves. It is not only a serious pest because of its sap-sucking habits, but because of its exudations of sugary matter upon which the smut fungus mentioned above lives. The rust-mite of the orange, also called the silvery mite of the lemon, because of the appearance of its work upon the two trees, sometimes injures the fruit; and the six-spotted mite (*Tetranychus sexmaculatus*), a close relative of the red spider of greenhouse notoriety, feeds upon the under sides of the leaves. The mites may be controlled by flowers of sulphur, which for the former should be added to kerosene emulsion.

The most dreaded group of insects, however, is that of the scale insects, of which there are a very large number that attack both foliage and trunks. With few exceptions the remedies found most satisfactory for these insects are hydrocyanic acid gas. Consult 'Farmers' Bulletin 923' of the United States Department of Agriculture.

The most notable exception is the white or fluted scale (*Icerya purchasi*), an introduction from Australia. Having become exceedingly troublesome in California, its natural enemy, a ladybird beetle, was introduced with the result that it is now rarely seen in the State. Other well-known scale-insects in California orange groves are the red scale (*Aspidiotus citricola*), the black scale (*Lecanium oleæ*); in Louisiana groves, the chaff scale (*Parlatoria pergandei*) is most important, but the purple scale (*Mytilapis citricola*) is also somewhat troublesome, as is also the orange chionaspis (*Chionaspis citri*); in Florida groves, the chaff and the purple scale are well-known pests, as also are the long scale (*Mytilapis gloveri*) and the Florida red scale (*Aspidiotus ficus*). Many of the insects mentioned occur in Mexico, the West Indies, etc.; some of them in Europe, Australia

and other parts of the world; but the insect fauna of foreign countries is rich in species that do not appear in the American list.

M. G. KAINS.

ORANGE RIVER, South Africa, the most important southern river of the continent, rising in the Kathlamba or Drakensberg range, within 100 miles of the Indian Ocean, and traversing the country eastward to the Atlantic Ocean, with a slight northerly inclination. The native name of the river is Gariep, which, in the Hottentot language, means "great water." It received its present name in 1777 in honor of the House of Orange. It describes numerous wide curves in its course of 1,300 miles, and separates Cape Colony on the south from the Orange River Colony, Griqualand West, Bechuanaland and German Southwest Africa on the north. Area of basin, 325,000 square miles. Its principal tributaries are the Caledon and the Vaal, both joining it from the right. Its volume varies greatly between the dry season, when it is not navigable, and the rainy season, when it overflows its banks in the upper parts of its course. Its mouth is obstructed by a bar, but above the bar it is navigable for small vessels.

ORANGE-ROOT, the common name of the hydrastis. See **GOLDEN SEAL**.

ORANGE-TIP, one of the several butterflies of the family *Pieridæ* (q. v.), which are usually white and marked with black and with a conspicuous orange spot at the end of the front wings. The lower surface of the hind wings are mottled with a greenish network.

ORANGEBURG, ör'énj-bèrg, S. C., city, county-seat of Orangeburg County, on the Edisto River and on the Atlantic Coast Line and the Southern railroads, 81 miles north by west of Charleston and 50 miles south by east of Columbus. It was settled in 1735 by Swiss and Germans, was incorporated in 1755 and chartered as a city in 1870. It is in an agricultural and lumbering region. The chief manufacturing establishments are cotton mills, lumber and planing mills, a sash and blind factory, flour and grist mills, ice factory, brick works, wagon and carriage factory and printing works. There are two colleges for colored pupils, one a State industrial institution and

the other under the auspices of the Methodist Episcopal Church. There are graded schools for both white and colored and seven churches. The four banks have a combined capital of \$210,000, and the annual amount of business is about \$1,500,000. The city, which has adopted the commission form of government, owns and operates the electric-light plant and the water-works. Pop. (1920) 7,290.

ORANGEMEN, the unfortunate party designation which for more than a century has contributed to keep alive religious and political divisions of the worst character in the British Empire, especially in Ireland. The Orange organization had its origin in the animosity which had subsisted between Protestants and Roman Catholics in Ireland since the Reformation, but which reached their full development after the Revolution of 1688, and the wholesale confiscation of Roman Catholic property by which that event was followed. From that time the Roman Catholics of Ireland may be said legally to have lost social, political and religious status in their own country. Some attempts in the latter part of the 18th century to ameliorate their condition excited, especially in the north, the alarm of the Protestant party, who regarded the traditional "Protestant ascendancy" as endangered. Acts of violence became frequent, and, as commonly happens, combinations for aggressive and defensive purposes were formed by both parties. The members of the Protestant associations appear at first to have been known by the name of "Peep-of-day Boys," from the time at which their violences were commonly perpetrated; the Roman Catholics who associated together for self-defense being called "Defenders." Collisions between armed bodies of these parties were frequent. In 1785 a pitched battle, attended with much bloodshed, was fought in the county of Armagh. Attempts at repression of open violence were inefficient, yet had the effect of diverting the current into the more dangerous channels of secret associations. The rude and illiterate mob of Peep-of-Day Boys made way for the rich, influential and equally bigoted organization of the Orange Society, which by degrees extended its ramifications into every portion of the British Empire and into every grade of society from the hovel to the very steps of the throne. It was named from the Prince of Orange, William III, who, in Ireland, has been popularly identified with the establishment of the Protestant ascendancy. The first "Orange Lodge" was founded in the village of Loughgall, County Armagh, on 21 Sept. 1795. It was a region and time of outrage, 12 or 14 houses of Roman Catholics being sometimes, according to disinterested witnesses, wrecked in a single night. The association which began among the ignorant peasantry soon worked its way upward. The general disaffection toward English rule, which at that time as it does to-day pervaded Ireland, and in which Roman Catholics, as a natural consequence of their oppressed condition, largely participated, tended much to identify in the mind of Protestants disloyalty with popery; and the rebellion of 1798 inseparably combined the religious with the political antipathies. In November of that year the Orange Society had already reached the dignity of a grand lodge of Ireland with a grand mas-

ter, a grand secretary and a formal establishment in the metropolis; and in the following years the organization extended over the entire province of Ulster and had its ramifications in all the centres of Protestantism in the other provinces of Ireland. In 1808 it extended to England. A grand lodge was founded at Manchester, from which warrants were issued for the entire kingdom: its seat was transferred to London in 1821. Memorable in the history of the Orange Society was the election of a royal duke (Cumberland) in 1827 as grand master for England and as imperial grand master in 1828. The Roman Catholic Relief Act of the following year stirred up all antipathies of creed and race in the Ulster bigoted horde and emissaries were sent out to organize lodges in Wales, Scotland, Canada, the Mediterranean region and in the other colonies. A formidable part of this zealous propagandism was its introduction into the army about 1824-26. No fewer than 32 regiments were proved to have received warrants for holding lodges in Ireland and the English grand lodge had issued 37 warrants for the same purpose. The organization was complete and extensive. The only condition of membership was that the applicant should be a Protestant and 18 years of age. In 1835 the association numbered 20 grand lodges, 80 district lodges, 1,500 private lodges and 200,000 to 220,000 members. Its worst effect was its supply of a constant incentive to party animosities and deeds of violence. The spirit of fraternity which pervaded its members was a standing obstacle to the administration of the law; and confidence in the local administration of impartial justice by magistrates was destroyed forever for the Irish Catholic. An alleged Orange conspiracy to alter the succession to the Crown in favor of the Duke of Cumberland led to a protracted parliamentary inquiry in 1835; the Orange Society had overreached itself, and this inquiry, as well as a shocking outrage by an armed body of Orangemen, on the occasion of a procession in Ireland, so discredited the association that its respectability has since gradually diminished. For several years the Lord Chancellor laid down a rule by which no member of the Orange Association was admitted to the commission of the peace, and the association became comparatively without influence, except among the very lowest classes of Protestants in northern Ireland. Of the colonial offshoots of the Orange Association, those of Canada have at all times been most active, and outrages against Roman Catholic churches and convents were frequent until recent years; and on the occasion of the visit of the Prince of Wales (afterward Edward VII) to Canada, an attempt was made to force from his royal highness a recognition of the association, which was defeated by his own firmness and by the judicious counsels of his advisers. The Orangemen of British America constitute about 1,200 lodges, with about 150,000 members. The Repeal agitation in Ireland in 1848, the disestablishment of the Protestant Church of Ireland in 1869 and the Fenian and Nationalist associations were all violently opposed by the Orange faction. The Home Rule campaigns again called forth their animadversions, and more recently the Sinn Féin party and policy and the Gaelic League program for an Irish

Ireland have aroused all the latent bigotry of this unchristian, undemocratic society. The society holds great demonstrations annually on 12 July, the anniversary of the Battle of Aughrim and (reckoning by old style) of the Boyne. Serious riots have attended some of these demonstrations of alleged loyalty. That the Orange Society has secured a grip on the British army was shown during 1914, when several officers at the Curragh and elsewhere, including General French (later marshal and viceroy) and General Gough (later removed for inefficiency in the battle of Picardy), were prepared to resign their commissions rather than lead a military contingent to enforce an act of the Imperial Parliament against the Orangemen of Ulster, who resisted that same edict. However, the power of Orangeism is waning; the democratic, liberal atmosphere of the 20th century is not conducive to the growth of bigotry and Orangeism is being slowly choked to death, especially in the United States, where its dying efforts awaken little sympathy. In the United States the organization has four branches or classes; a supreme grand lodge, which is the highest jurisdiction in the United States; State grand lodges, with jurisdiction over district and subordinate lodges in their respective States; district lodges, with jurisdiction over the fourth class, or subordinate lodges in their respective jurisdictions. In a number of States some subordinate lodges are under the direct jurisdiction of the supreme grand lodge. State grand and district lodges exist in Pennsylvania, New York, New Jersey, Ohio and California. District lodges without State jurisdiction exist in Massachusetts and Michigan. There are upward of 400 subordinate lodges throughout the United States with a membership aggregating about 30,000. A higher branch of the order, known as the Royal Black Encampment of Israel, also exists in nearly all States of the Union. Its various branches are known as preceptaries and its members are recruited from the full-degreed Orangemen. There is also a ladies' auxiliary, known as the Ladies' Loyal Orange Association of the United States. It has a total membership of about 20,000, with upwards of 200 lodges. The institution maintains a National Home for the Care and Support of Aged Inmates and Orphan Children at Hatboro, Pa. Consult Lecky, 'History of England in the Eighteenth Century' (Vols. VII, VIII, London 1878-90); Lilburn, 'Orangeism: its Origin, Constitution and Objects' (1866).

ORANGEVILLE, Canada, town, county-seat and outport of Dufferin County, on a branch of the River Credit, 49 miles northwest of Toronto and on the Canadian Pacific Railway. It is a large grain shipping centre, has flour and woolen mills, foundries, machine-shops, casket works, furniture manufactories and other industries. Pop. about 2,340.

ORANGUTAN, ō'räng-oo'tän, the Malay name, signifying "man of the woods," of the large anthropoid ape (q.v.) of Borneo and Sumatra. The orang belongs to the typical genus *Simia* of the family *Simiidae*, and there is probably but one species (*S. satyrus*), though some naturalists believe otherwise. The face and skull of the young are very human, but in the adult the jaws become protruding and the crown elevated. The body is short and

massive, the legs short and bowed, and the arms and hands disproportionately long, reaching to the ankle, but the thumb is very short. Except for the face, hands and feet, the animal is thickly clothed with coarse, reddish-brown hair, which is especially long on the arms, where it converges to the elbow, the thighs and the beard of the male. There are no ischial callosities and no tail. Cheek-pouches are absent, but old males have the face much broadened by the development of prominent fibrous warty protuberances and in this sex the canine teeth become much enlarged. In some respects this ape approaches man more closely than any other existing species, but in others it differs widely and resembles the lower apes. In size it is much inferior to the gorilla of equatorial Africa, seldom exceeding four feet in height, and it lacks the high sagittal crest, and particularly the prominent superciliary ridges, which give to the males of that species so ferocious an aspect. At the present time the orang is confined to the deep swampy forests of Borneo and Sumatra. It is arboreal in habit and builds nests of boughs and leaves among the branches of the trees. For this mode of life its structure is eminently adapted, its long arms, crooked legs and great strength enabling it to travel through the tree-tops with the greatest facility. To an equal degree these structures ill adapt it to terrestrial locomotion. It does not stand erect, as often represented, except now and then for a short time, and when supported, but in a semi-erect attitude, resting on the side of the inturned feet and on the knuckles of the hands, which, as a consequence, develop callosities. The orang lives exclusively upon a vegetable diet, consisting chiefly of fruits. The males especially have powerful voices, made possible by the great development of the larynx. Naturally they are sluggish and sullen, but the disposition is mild. Stories of their great ferocity, and particularly of their habit of lying concealed in the branches of trees above pathways, from which they reach down a foot to grasp men by the throat, are pure fables. In confinement one of their most interesting characteristics is their teachability and the changing expression of the face resulting from the great mobility of the lips. Consult Hartmann, 'Anthropoid Apes' (1886), in which many other authorities are given; Forbes, 'Allen's Natural History,' Vol. I (1897); and the books of Wallace, Forbes, Hornaday and other scientific travelers in the Malayan region.

ORATION ON THE CROWN, The.

This oration, like the speech of Achilles in the ninth book of the 'Iliad' and many of the finest speeches in the world, is a reply. It is Demosthenes' final vindication of his entire life and policy against the censure of his life-long rival and adversary, Æschines. In 336 B.C., two years after the Macedonian defeat of Athens and Greece at Charonea, Ctesiphon proposed in the senate the honor of a golden crown for Demosthenes in recognition of his services to the state as commissioner for the fortification of Athens and treasurer of certain public funds. The main purpose of the bill, however, was to affirm Athens' loyalty to the lost cause of democratic resistance to Macedonian imperialism. Æschines stopped the progress of the bill by an indictment analogous to a plea of unconstitu-

tionality in our Supreme Court. For some six years while the success and the consolidation of Alexander's conquests in the East hung in the balance neither side ventured to bring the suit to trial. But in 330 the party of Demosthenes found courage to press for a decision. There was some force in the technical pleas that Demosthenes' accounts had not been audited at the time of the introduction of the bill and that the proposed proclamation of the Crown in the theatre was illegal. But everybody knew that the real issue was the charge that the allegation that Demosthenes had well served the state was false. It was to be a duel between the two greatest orators of Athens. A huge popular jury and a large audience attracted from all Greece were to pass judgment on the policy of Athens for the past 30 years. The logic of fact favored Æschines. The Macedonians had won. But Æschines was embarrassed by the narrow technicality of his strongest pleas and by the suspicion that his retrospective pacifism was the veiling camouflage of pro-Macedonian sympathies that verged on treason. His speech is very clever. But its effect is marred by these doubts of his sincerity and also by his strident insistence on the petty technicalities of his case and his tediously repeated demand that Demosthenes shall meet this issue first in his reply.

Demosthenes is too shrewd to fall into that trap. He merely animadverts on the unfairness of the attempt to prescribe to him the order of his topics, and postpones his plausible and contemptuous treatment of the two technical issues to a convenient place between two of the strongest patriotic passages of the speech. This leaves him free to review his entire political career and the relation of Athenian democracy to Macedonian autocracy in the chronological division adopted by Æschines himself for that portion of his argument. There is no space here for this historical detail. Fully to appreciate the oration on the Crown one should come to it fresh from the perusal in chronological sequence of the 'Philippics' and 'Olynthiacs' and other public orations of Demosthenes in Kennedy's translation. Failing that the late Prof. S. H. Butcher's admirable little book, 'Demosthenes,' in the Classical Writers Series, or the chapters in Jebb's 'Attic Orators' or the historical introduction in Goodwin's edition of the 'Oration on the Crown' will serve. Even without this historic background the oration may be enjoyed as the supreme expression of the sentiment that in a righteous cause it is better to have fought and lost all save honor than never to have fought at all. This is the meaning of the famous oath by Marathon and Salamis which detached from the context may seem in a rough English rendering a mere flight of rhetoric: "They deceive you, men of Athens, they lie who tell you that it was a mistaken policy for you thus to imperil your city for the salvation and enfranchisement of all the Grecian world. It was no error; no, by our fathers, who first faced the barbarian at Marathon, who held the lines of Platea and manned the ships of Salamis and Artemisium — no, by the thousands who sleep in our national cemeteries, brave men all, all worthy of like memorial honors, not only those who succeeded, no not the victors alone." Only a professional student of Greek style can appreciate the

ORANG-UTAN (*Simia satyrus*).

minute finish of Demosthenes' diction, rhythm and sentence structure. But the essential quality of his oratory is apparent in any good translation. It is neither the stately, elaborate rhetorical diffuseness of the tradition of Cicero, Burke and Webster, nor the matter-of-fact aridity of modern business oratory, nor the loose, familiar colloquialism of modern popular eloquence. It is impassioned logic, an indissoluble blend of close, if sometimes sophisticated, reasoning and feeling. In this it resembles some of the more combative speeches of Lincoln, and it also recalls Lincoln in its art of pressing the definite issue home in a series of unanswerable questions and inescapable dilemmas. There is less, of course, of Lincoln's supreme and almost unique quality, absolute fairness to the other side. 'The Oration on the Crown' was usually read in the junior or senior year of the old-fashioned American college, and it would be an interesting task to collect the distinct reminiscences of this study in American oratory from Webster to Bryan and to note the influence of Demosthenes in modifying the more florid tradition of Cicero and Burke.

PAUL SHOREY.

ORATIONS AGAINST CATILINE. In 63 B.C., Lucius Sergius Catilina (Catiline), descendant of an ancient Roman patrician family and long a conspicuous figure in the political life of Rome, renewed his candidacy for the consulship. At the same time he began the organization of his famous conspiracy, rallying to his support the elements of discontent throughout Italy and planning for simultaneous uprisings at various points, in case he should encounter defeat at the polls. When in the autumn of 63 B.C. this defeat became reality, his adherents raised the standard of revolt at Fæsulæ (Fiesole) in Etruria. The news of this uprising and of other details of Catiline's treasonable projects moved Cicero, as the first magistrate of the republic, to deliver against Catiline and his accomplices several vehement speeches. The first of these ("Quo usque tandem abutere, Catilina, patientia nostra?") was delivered 8 November before the Senate, where Catiline himself had had the presumption to appear in person. The orator assails Catiline's effrontery in being present among the very men he had marked for slaughter, and declares that the government has full knowledge of the plans of the conspirators. He urges Catiline to leave Rome with all his followers. The second oration ("Abiit, excessit, evasit, erupit") was delivered the following day before the people assembled in the Forum. Cicero congratulates them on Catiline's departure. Now, he says, it will be possible to wage war openly against the traitor, although many of his secret supporters still infest the capital. Cicero then proceeds to define the issues, enumerating the different classes of Catiline's adherents, who are asserted to consist of all the most disreputable elements of the state. Such of these as have remained in the city are warned that they must expect no indulgence, if they undertake to lend help and comfort to the conspirators. On the departure of Catiline from Rome the direction of the conspiracy fell into the hands of Lentulus, a man of irresolute and indolent character. Reasonable negotiations were begun by him with cer-

tain Allobrogian envoys, who happened to be in the city. Cicero, obtaining information of these schemes, arranged to surprise and capture the envoys as they were leaving Rome with incriminating documents upon their persons. The evidence thus procured was laid before the Senate, which was then convened by Cicero in the Temple of Concord abutting on the Forum. In the third oration, delivered before the people, 3 Dec. 63 B.C., the orator presents the details of these recent occurrences, not omitting to inform the people that the Senate had decreed a thanksgiving to the gods in honor of his success in unearthing the plots laid against the government. He promises to remain worthy of the continued confidence of the people. The fourth oration against Catiline was delivered in the Senate, 5 Dec. 63 B.C., in the course of the formal debate concerning the penalty to be inflicted on the arrested conspirators. Two courses were advocated by different groups in the Senate. One group, headed by Julius Cæsar, urged that the conspirators be distributed among some of the provincial towns of Italy and kept in confinement for life. Cicero admits that this course of procedure would be simpler for himself, as it is the more popular and will relieve him of the odium of having executed the decree of death against fellow-Romans. Yet he declares that duty compels him to support the proposition of the senator Decimus Silanus, who urged that the penalty of death be imposed upon those who had attempted not only to murder the Roman magistrates and senators, but also to devastate the city itself by fire. When it was urged that Roman law forbade the execution of Roman citizens without allowing them an appeal to the people, Cicero met this argument with the specious plea that men guilty of the monstrous designs of the indicted conspirators could not enjoy the protection of this privilege, since by these very designs they had forfeited all claims to their rights as citizens.

The fame of these four Catilinarian speeches lies partly in their authorship, partly in the importance of the events with which they deal. There can be no doubt of the grave menace to the government in 63 B.C. There was great social distress and political unrest. Unprincipled men with large political influence and ambitious designs were ready for a reckless assault upon existing institutions and vested rights. Yet Cicero, while undoubtedly correct in his assertions as to the existence of a carefully laid conspiracy, probably exaggerates the criminal intent of Catiline and his accomplices, and paints the personal character of Catiline himself in darker colors than warranted by the facts. All four of the orations abound in vehement personal abuse and in turgid rhetoric, not a little of which is devoted to magnifying Cicero's own merits in saving the city from destruction. There is a translation by C. D. Yonge in the Bohn Library.

CHARLES E. BENNETT.

ORATORIANs, or CONGREGATION OF THE ORATORY. The name of two religious associations in the Roman Catholic Church, the Oratory of Saint Philip Neri and the Oratory of Jesus. See **ORDERS, RELIGIOUS; NERI, SAINT PHILIP; NEWMAN, JOHN HENRY.**

ORATORIES, The. See **ORDERS, RELIGIOUS.**

ORATORIO. A musical setting of a sacred theme, generally dramatic in character, consisting of choruses and solo voices with an orchestral accompaniment. The name seems to be derived from the oratory of the churches in which it had its beginning. While technically its origin may be traced back to the first dramatic representation of Bible History, for practicable purposes its history as a distinct art form began about the middle of the 16th century, when Filippo Neri, a learned priest, instituted a series of public lectures on Scripture History in his church in Rome; and in order to make them the more attractive he arranged narrative dialogues on the subject matter of his discourses, interspersed with hymns of a type known as "laudi spirituali." Pope Gregory XIII encouraged the development of the scheme, and no less important a composer than Palestrina lent his aid by writing music for this special purpose. Neri died in 1595, and five years later there was produced at Rome a sacred drama with music, entitled 'La Rappresentazione dell' Anima e del Corpo' ('The Soul and the Body'), written by Cavalieri, a Roman composer of note. By a singular coincidence, the year 1600 also saw the first performance of Peri's 'Euridice,' the earliest example of modern opera. The oratorio employed the same new style of music, and there has been much learned discussion on the subject of the priority of the discovery, never finally decided, although it is said that Peri himself conceded the honor to Cavalieri. The development of the two forms continued side by side, though, unfortunately, Cavalieri's death shortly prior to the first performance of his work cut short his efforts; and for a time interest generally centred on the growth of opera. The next great composer to enter the field was Carissimi, who wrote numerous oratorios as well as sacred cantatas (choral works of smaller design) and did much to give the new art form, stability and permanence. His most illustrious successor was Alessandro Scarlatti, his pupil, and a still greater and more versatile genius, who attained a mastery over the technical requirements of his art that make his oratorios even now a source of deep musical, as well as historical interest. Handel drew on both Carissimi and Scarlatti for material used in his oratorios. Caldara, Leo and Stradella form a brilliant trio who are enrolled high in the list of oratorio writers. The famous story of Stradella's music melting the hearts of the ruffians sent to murder him refers to the first performance of his oratorio 'San Giovanni Battista.'

The oratorio in Italy always retained its intimate association with Italian opera. In Germany, its origin also was the miracle-play; but it developed along quite a different path—that of the passion music. For a time, composers absolutely limited themselves to the story of the Passion of Christ. Heinrich Schütz may fairly be called the father of the modern oratorio; since his work represents really the connecting link between the two styles out of which grew the oratorio of Handel and his followers. After Schütz, the chorale, a hymn tune harmonized for congregational singing and distinctively a German contribution, became a regular feature of the oratorio and supplanted the plain-song which was used by the Italian composers as a

natural result of the Church influence on their work. The name of Bach, pre-eminent in musical history, is most closely associated with his Church music. There are four oratorios from his pen extant—the 'Christmas Oratorio,' which is really a group of six cantatas intended for performance on separate days, and three Passion oratorios, 'Saint Matthew,' 'Saint John and Saint Luke' (the last named not of unquestioned authenticity)—and probably there were two more which have disappeared. The Saint Matthew Passion shares with the B minor Mass the distinction of filling the highest place in the list of Bach's works. A contemporary of Bach, whose proximity to the great composer has dimmed his real worth, Karl Heinrich Graun, was the last great composer of Passion music. His 'The Death of Jesus,' a posthumous work, shared for many years the popularity of the 'Messiah' and the 'Creation.'

Handel is to-day best known for his long series of oratorios; but he was more than 50 years old before he began to write them. Previous to that, he had devoted most of his great energies to the production of operas and had become the most prominent living composer in that field. The 'Messiah' is, of course, his best-known and best-loved oratorio, and is accorded by musicians first place among his works, though 'Israel in Egypt' is characterized by Rolland as "the most gigantic effort which has ever been made in oratorio." A performance of the 'Messiah' directly inspired Haydn, then advanced in years, to write his 'Creation,' and the 'Seasons,' Beethoven's only oratorio, 'The Mount of Olives' is not strongly characteristic of the composer and is marred by an inferior text. Spohr was the most successful oratorio writer of the early part of the last century, but he was eclipsed by Mendelssohn, on whom, with his 'Saint Paul' and 'Elijah,' fell the mantle of Handel. 'Elijah' forms with the 'Messiah' and the 'Creation,' the most popular group of oratorios in the present-day repertoire. Liszt's 'Christus' and 'Saint Elizabeth' (the latter often performed on the opera stage), Gounod's 'Mors et Vita' and the 'Redemption,' Brahms' German requiem and Franck's 'Les Beatitudes' are important finger-posts on the road of the oratorio. Elgar's 'Dream of Gerontius' is the most conspicuous recent contribution to its literature. In England, choral music has always found a fruitful soil and Elgar is only the most prominent of a number of composers who have worked assiduously in that field. America has not added many to the list of notable achievements in oratorio. John K. Paine, one of the pioneer American composers, wrote a 'Saint Peter' that is entitled to greater recognition than it has received; and Horatio Parker's 'Hora Novissima' has made a prominent place for itself.

The line of demarcation between the oratorio and other choral works of a religious character is not very definite; and some examples of The Requiem, Te Deum, Stabat Mater and Magnificat are so elaborated and developed that they are closely akin to the oratorio proper, and in fact are often performed as oratorios. In the appended list are included some of the greater works which by their importance and architectonics are fairly to be classed with true oratorios.

LIST OF PRINCIPAL ORATORIOS.

TITLE	Composer	First performance
Apostles.....	Elgar.....	3 Oct. 1903
Beatitudes, Les.....	Franck.....	Summer 1891
Children's Crusade.....	Pierne.....	18 Jan. 1905
Creation.....	Haydn.....	2 April 1798
Christmas Oratorio.....	Bach.....	Dec. 1734
Christus.....	Liszt.....	29 May 1873
Dream of Gerontius.....	Elgar.....	3 Oct. 1900
Eli.....	Costa.....	29 Aug. 1855
Elijah.....	Mendelssohn.....	24 Aug. 1846
Franciscus.....	Tinel.....	22 Aug. 1888
German Requiem.....	Brahms.....	10 April 1868
Hora Novissima.....	Parker.....	3 May 1893
Israel in Egypt.....	Handel.....	4 April 1739
Judas Maccabaeus.....	Handel.....	1 April 1747
Judith.....	Parry.....	29 Aug. 1888
Last Judgment.....	Spohr.....	25 March 1826
Light of the World.....	Sullivan.....	27 Aug. 1873
Manzoni Requiem.....	Verdi.....	22 May 1874
Messiah.....	Handel.....	13 April 1842
Mors et Vita.....	Gounod.....	26 Aug. 1885
Mount of Olives.....	Beethoven.....	5 April 1803
Prodigal Son.....	Sullivan.....	3 Sept. 1869
Redemption.....	Gounod.....	30 Aug. 1882
Requiem.....	Berlioz.....	5 Dec. 1837
Requiem.....	Mozart.....	14 Dec. 1793
Rose of Sharon.....	Mackenzie.....	16 Oct. 1884
Saint Elizabeth.....	Liszt.....	15 Aug. 1865
Saint Ludmilla.....	Dvorak.....	15 Oct. 1886
Saint Matthew Passion.....	Bach.....	15 April 1729
Saint Paul.....	Mendelssohn.....	22 May 1836
Saint Peter.....	Paine.....	June 1873
Saul.....	Handel.....	16 Jan. 1739

Musical Critic and Composer.

ORATORY. A full treatment of this subject would include the History of Oratory which, like other important educational subjects, has its philosophy of cause and effect, effort and achievement, and inherency and environment. This phase of the theme is treated in the article ORATORY (q.v.). For a more extended study the reader is referred to the 'History of Oratory from the Age of Pericles to the Present Time,' by Dr. Lorenzo Sears. While the Oration is recognized as the highest form of public discourse the term Oratory is here used in its broadest sense and includes all kinds of public speaking from the lowest to the highest. The subject will be treated under three main divisions, the Kinds of Discourse, the Plan of Discourse and the Qualities of Discourse.

I. Kinds of Discourse.—1. *Business Remarks.*—Perhaps the lowest form of public speech is Business Remarks, which are usually made for the comfort or the welfare of the members or audience but have no bearing upon the object or discussions of the meeting. They should be brief, to the point and wholly without display; the chief temptation is to magnify them into a set speech.

2. *Committee Reports.*—Another low form of speech is the Report of a Committee through its chairman who acts as the spokesman of the committee. The report may be read as a concise statement adopted by the committee or it

may be given in substance from notes or records, but in all cases it should be devoid of any coloring in phraseology or manner which might betray the chairman's own prejudice or convictions.

3. *Essays.*—The Essay when read by the author to an audience rises higher in the scale and is a much used form of discourse; when read by another or a mere clerk, though it may be an important document such as a presidential message, it becomes a low form of public address and rarely claims much attention from the audience. Fundamentally an Essay should be didactic, critical and instructive in style; though with more color of language and a high degree of mastery of the subject matter so that the eye may not be confined too closely to the page, it may become a highly effective speech.

4. *Debates.*—The Debate differs from all other forms of speech in that the speaker expects a reply from opponents who hear him, his statements are made under the cross-fire of rebuttal and repartee and the debaters expect an immediate decision of the question by vote of the judges, the verdict of the jury or the voice of the people. The speaker may or may not choose his subject, but he finds himself in the attitude of attack or defense of some proposition or resolution to be established or disproved, with the resultant condition of the victor or the vanquished. A good question for debate must have two sides of about equal strength, it should have some human interest at stake and be worth discussion. In preparation for debate the speaker should make a good selection of material from books, magazines and newspapers, study both sides of the question, clear his mind of all mere notions or prejudices for or against the proposition, and prepare a clear, logical outline or Debater's Brief setting forth the Burden of Proof and Presumption, the main Issue, the argument and the law and authorities relied upon in trying the case. The logical trend of debate is treated in the article on ARGUMENTATION (q.v.).

5. *Topical Speeches.*—A Topical Speech, as the name implies, is a speech on some topic or subject chosen by the speaker or assigned to him. It is a somewhat informal speech made to a limited audience. It should be as brief as possible and rarely include more than "three good points and three good illustrations." It has a wide range of subjects, some of which should be treated in a purely didactic way, while others may rise to the glow of conviction and give the flavor of good-will, pathos or humor. The kinds of Topical Speeches are:

(1) *Toasts*, or After-Dinner Speeches of various degrees of importance. In recent years this form is much used by political aspirants for making public their ambitions and desire to "right the public wrongs."

(2) *Speeches of Introduction of the Speaker* to his audience, which should be brief and complimentary, but devoid of unwarranted assurances of the speaker's abilities.

(3) *Before Classes, Clubs, Conventions and Associations* of an educational, religious or benevolent nature, which should be didactic and very direct in style.

(4) *Gavel Speeches*, in which the retiring president of an association presents that emblem of authority to a newly elected president

who is not yet ready to give a formal Inaugural Address; and the response by the president-elect who acknowledges the honor and asks the co-operation and support of the Association for his approaching administration.

(5) *The Notification Speech* of the Chairman of a committee to a presidential nominee in which he reiterates the platform of the party as expressed by the nominating convention.

(6) *The Acceptance Speech* of a presidential nominee made several weeks after the notification in which he gives his mature interpretation of the platform of the party and sounds the key-note of the campaign.

6. *Addresses*.—The Address is much more formal than the Topical Speech and is better suited to larger assemblies. There are six varieties as follows:

(1) *The Salutatory* which is an address of greeting or welcome. In college life it is usually given by the second honor member of the senior class on the commencement occasion, but it has its counterpart in practical life in the address of welcome to some noted statesman, philanthropist or other distinguished citizen or guest. It is necessarily complimentary in nature and requires good taste on the part of the speaker that his praise may not become fulsome or his admiration smack of hero-worship.

(2) *The Valedictory* is a formal farewell address usually made by the first honor graduate at the commencement exercises of a college. It calls up pleasant associations, enshrouds all shortcomings in a mantle of charity, extols those virtues which promise future success and attainment, and pledges loyalty to the treasured memories of the past. Such an address would be appropriate in practical life when a speaker retires from an important field of service. It admits of a high order of eloquence and should inspire hope and confidence in the administration of a successor.

(3) *The Commencement Address*, usually provided by the senior class or the literary societies, is a distinct college speech which inspires students to high standards of literary effort, lofty purposes and aims in life, and noble character. The form should be methodical, the style dignified, and the language a model of good English and rhetorical excellence. Great care should be exercised in the selection of the speaker who should be a literary man of high character, marked achievement and good delivery.

(4) *The Inaugural* of the President of an association or of the nation, the governor of a State, or the chairman of a large and formal convention is an important kind of an address. The speaker should acknowledge the honor conferred upon him, pledge faithfulness to duty and proclaim his policy. He should not criticize his predecessor, but show a strong desire to build by the light of past administrations.

(5) *The Political Address* has for its primary aim the interests of the party or its official candidates, and asks an expression of the will of the people in a vote on election day. The occasion and message of such an address ranges from the harangue of the stump speaker to the most dignified and learned discussion of vital national issues by some great statesman. The speaker should not be too statistical nor use the language of the political demagogue,

but try to be clear, candid and generous to opponents.

(6) *Addresses Before Conventions*, Congregations and other large bodies of people of similar tastes and convictions, not of a political nature, such as Teachers' Institutes, Chautauqua assemblies, Synods, and Conferences, vary according to the occasion and the message, but they are distinctly unlike the other addresses named. They are generally of a professional, educational, scientific or moral order and deal largely with methods, motives and aims of work in a given sphere of activity.

7. *Lectures*.—The lecture is a well recognized form of speech somewhat akin to the address; yet it is more formal, bears the stamp of greater preparation and is used repeatedly in about the same language and form. There are two kinds:

(1) *Lectures to Classes in Schools*, colleges and other institutions, which should be didactic in style, precise in statement, methodical in arrangement, progressive in development and so presented that the students may fully comprehend the subject treated and take notes for future study.

(2) *Platform Lectures* before popular audiences the object being instruction and entertainment. No matter how scientific the subject it must be treated in a popular way with ample illustration and sufficient reduction of technical terms to common phraseology so that the audience may fully understand the speaker. There is a large demand for the highest type of this form of public entertainment.

8. *Sermons*.—The sermon is a spoken discourse by a duly ordained clergyman on some theme or text from the Bible and delivered as a part of a church service. There are six varieties as follows, the first three of which are named by Dr. Broadus from the standpoint of the subject or text, and the last three are considered from the standpoint of the occasion:

(1) *The Subject Sermon* in which the text from Scripture only suggests the theme, the analysis of which and plan of treatment must be entirely constructed by the preacher.

(2) *The Text-Sermon* in which the analysis, headings and subdivisions are all inherent in the text, leaving the tactful preacher, as Dr. Shedd put it, "to find the hidden skeleton."

(3) *The Expository Sermon* which is exegetic in method—a purely Scriptural form of preaching—in which several passages or even a whole chapter may be expounded.

(4) *Didactic Sermons* relating to Church government, influences, beliefs, creeds or the ethics of religion.

(5) *Exhortatory Sermons* which are more emotive in nature and intended to move the will of the congregation to immediate action.

(6) *Special Occasion Sermons*, such as the dedication of a church, installation services, the institution of baptism or the sacrament, sermons on Thanksgiving Day, Christmas, Easter and on fraternity, memorial and funeral occasions.

9. *Orations*.—The oration, as we conceive it, is the loftiest type of public speech and it marks the highest attainment of the public speaker. It is dignified and formal in style, clear in logic, forceful in thought, sound in philosophy, eloquent in language, emotive and

persuasive in spirit, and, withal, it is constructed with the plot and motive of a great drama. It gathers up the salient facts of history and experience bearing upon the subject discussed, holds them up in the searchlight of the present day and generation and weaves them into the fabric of the future. It moves the audience by persuasive, climatic impulses and stirs men to action. It must spring from the orator's own conviction and bring a message that is genuine, unmistakable and generally optimistic. Its object is to educate and inspire the masses, elevate the standards of morality and citizenship, or bring about great civic reforms and national movements. The stamp of its influence is clear in the national life and character of the past, it is a vital, living force in the civil polity of the present and its promise of power and usefulness in the future is so great that it should be placed in the curriculum of every college and university that lays claims to a thorough preparation of youth for the duties and responsibilities of life.

Perhaps owing to a failure to distinguish the oration from the other forms of speech which we have named the rhetoricians of the present day have not greatly improved the classification of orations given by the ancient Greeks and Romans. In view of the preceding discussions we believe that the terms commemorative, panegyric and civic will prove comprehensive and inclusive.

(1) *The Commemorative Oration* celebrates some great event of history and aims, as Dr. Sears states, at "perpetuating something which is worth saving from oblivion and extending into the future what is too valuable to be restricted to the brief period when it was present among mankind." It is a high and inspiring order of oratory. Noble deeds are idealized, the outgrowth of past events and their relation to the needs of the present is shown and eloquent strains of warning or triumph mark the speech. Webster's two "Bunker Hill Monument" orations and Everett's oration on "The National Cemetery at Gettysburg" are notable examples of commemorative oratory.

(2) *The Panegyric Oration* is a formal and elaborate eulogy upon some great person who has passed away. It is an old form of oratory practised by almost all the great orators of the world, and, having stood the test of ages, it will doubtless live as long as virtue is praiseworthy among men. It combines the strongest points of demonstrative oratory and employs the highest type of eloquence. The style must be elegant, the praise, truthful, the encomium specific and not general, and the finished life and its closed events held up as an inspiration to the living for future guidance. George William Curtis' oration on "Wendell Phillips" and James G. Blaine's eulogy on "Garfield" are good illustrations of panegyric oratory.

(3) *The Civic or National Oration* is a deep, earnest discussion of great ethical principles, civic laws, social relations or economic movements necessary to the welfare and perpetuity of the state or nation. It has for its aim the elevation of standards of citizenship, national prosperity and international relations. Like the other forms of orations it employs the philosophy of history in forecasting future events, and rises to the loftiest eloquence whenever ques-

tions of great human interest are considered. "The Labor Problem," "Anarchy," "Arbitration," "Obedience to Law," "The Puritan and the Cavalier in our National Life" and "Internationalism" are appropriate subjects for civic oratory.

II. The Plan of Discourse.—All kinds of discourse should be constructed according to a good plan which will secure proportion, insure growth and prevent digression. Rhetoricians give variously from two to eight divisions of the discourse, but the simple outline, introduction, main discourse and conclusion seem to meet the demands in all kinds of speeches.

1. *Introduction.*—The importance of the first impression is of great moment to the speaker as well as to the audience. With a good introduction the critical attitude of the audience gives place to open-mindedness and acceptance of the truth as it is presented in the main discourse and enforced in the peroration. At the start the speaker must consider the occasion, the object of his speech and the mood of the audience he confronts. He may enjoy the support and sympathy of his hearers, or he may have their prejudice, false impressions or ignorance to overcome before he can discuss his subject successfully. To cover all cases we may say that the introduction should be local as to time, place and object of the speech, generally concrete and always definite in statement, deferential to the audience and to the preceding speakers if there be any, conciliatory if conciliation is needed, dignified both in commendation and condemnation, calculated to awaken attention and interest, brief as the occasion will allow, and it must name the subject or proposition to be discussed.

2. *Main Discourse.*—The distribution of materials, the statement of facts and the logical trend of discussion are closely allied to the subject itself and must vary according to conditions; but one of the following orders, or a combination of them, will apply to any kind of speech:

(1) *The Historical Order* arranges the facts, events, statements, proofs and conclusions, with regard to the time of occurrence. Antecedents relating to the past, circumstances relating to the present and consequents relating to the present and the future are all arranged chronologically. Webster's speech in the trial of Knapp for the murder of Capt. Joseph White, delivered 3 Aug. 1830, is an excellent illustration of the historical order of discussion.

(2) *The Logical Order* links all incidents, testimonies, proofs and arguments into a complete chain of argumentation, the whole subject being to convince the judge, jury or audience. (See ARGUMENTATION). Burke's speech on "Conciliation with the Colonies," delivered in the House of Lords 22 March 1775, illustrates the logical order.

(3) *The Distributive Order* arranges coexisting matters into groups and distributes these groups in their relation to each other and to the general aim of the speech. It often reverses the historical order. This method is especially adapted to the more eloquent styles of oratory, such as the panegyric or civic oration and has been employed by the greatest orators. It tests the tact and skill of the speaker who

must conform unswervingly to the three great principles of rhetorical structure, unity, climax and proportion.

3. *The Conclusion or Peroration.*—This is the crucial point for the skill of the speaker; it is the place of deepest interest and also of greatest peril. It leaves the final impression which may prove a triumph or a dramatic catastrophe for the orator. It should be carefully prepared in thought, language and even in delivery. The essential requisites of a good Peroration are Summary, Brevity and Termination and in formal oratory the heightening effect of eloquent language should be added.

III. *The Qualities of Discourse.*—Various qualities of discourse from Quintilian's three to Professor Bain's seven, have been described by rhetoricians. We suggest the following as inclusive terms for all speeches:

1. *Clearness*, which is the quality by which the thought and emotions are presented intelligibly to the audience. It deals especially with the diction and the syntax of sentences and the logic of thought. To insure clearness the speaker should cultivate the habit of clear thinking, study authors who are notably clear in style, have a definite knowledge of the subject and the main issues, follow a well ordered plan of discourse and yield to wholesome criticism.

2. *Force* is that quality which renders discourse capable of strong, vital utterance and energetic, expressive action. It is acquired by the selection of weighty idiomatic words whose meaning and phonetic constituents are full of power, by the use of strong, figurative language, by a skilful interweaving of short, energetic sentences with the necessary longer ones and by arranging the plan of discourse with special reference to climax and dramatic strength.

3. *Persuasiveness* is that quality of discourse which appeals to the will through the emotions. Persuasive passages should be in proper proportion to the thought-action of the speech and follow only when the minds of the audience have grasped the situation and when the enforcement of truth has been accomplished; hence persuasion is the special function of climaxes and the peroration. The language should be fraught with expressive words, pathetic or stirring associations of ideas and experiences, there should be a judicious use of expletives and striking figures of speech, and, above all, the speaker should manifest an earnestness of purpose and a full mastery of elocution or delivery.

ROBERT IRVING FULTON,
Dean of the School of Oratory, Ohio Wesleyan University.

ORATORY, History of. Oratory first became a subject of particular study among the Greeks settled in Sicily on account of the general unsettlement of all titles to property in Syracuse in consequence of wholesale confiscations. The exiles, on returning to their country, applied to the government for restoration of their possessions, but that could be effected only by their appearing and appealing in person to the courts. In this emergency Corax, by drawing up a few simple rules for the orderly and effective presentation of their claims and drafting a skeleton of an address to the court laid the foundation of the art of oratory

on which, 150 years later, Aristotle reared his immortal work on Rhetoric or Oratory, "incomparably," says Professor Jebb, "the most scientific work which exists on the subject: it may be regarded as having determined the main lines on which the subject was treated by nearly all subsequent writers"—of modern as of ancient times. But between the time of Corax and that of Aristotle was a period of development of the art, both in its theory and its practice, and that period is the golden age of Grecian, or rather Attic, eloquence. Corax had at the first mere imitators who developed the art of logography or of composing speeches or pleadings to be made in the courts by the parties to suits. The logographers then began to furnish to their clients, instead of the mere divisions and heads of a pleading, the whole speech written out, and trained their client in the memorizing and delivery of it. The first notable logographer at Athens was Antiphon (480-410 B.C.), but he had been preceded by a few years by the exceedingly brilliant but shallow sophist Gorgias, native of Leontini in Sicily, an orator and professor of oratory, who by his highly ornate style and his daring paradoxes commanded the interest of all and created a veritable furore. He exacted enormous fees for the privilege of attendance at his lessons in oratory and had for his pupils the most gifted and aspiring of the Athenian youth. He does not appear to have committed to writing the secrets of his special art. He laid the principal stress on delivery, elocution and proposed to his pupils as topics for declamation the philosophical speculations of the Eleatic school and others of an ethical nature. But Antiphon, though he was only a writer of speeches that were to be delivered by others, is reckoned as one of the 10 great Attic orators. He composed speeches not only for parties in suits at law, but also for speakers in the popular assembly, and thus he is to be regarded as the founder of the art of political oratory at Athens. Never in his life till in its last act did he appear as a speaker in the assembly of the people or in the courts of law. When he was brought to trial on the charge of high treason he delivered in self-defense a speech, of which, though it proved ineffectual to save him from capital punishment, Thucydides declared that no abler oration was ever made by any man in a like position. There are extant 17 orations composed by him, among them three "tetralogies"—presumably examples of forensic oratory designed to serve as school exercises and models. Each of the tetralogies comprises four speeches such as might be delivered in a trial for murder, namely, (1) the charge presented by the accuser; (2) the defendant's reply; (3) the accuser's answer to this; and (4) the rejoinder of the accused. The style of Antiphon's orations is rugged and lacks grace and elegance, as compared with that of most of his illustrious successors, but his discourse is ever forceful and convincing. Lysias, the third of the Attic 10, was also a logographer, but he was besides a man active in public life, and in addition to orations prepared for clients to be delivered by them in the law courts or in the assembly, he composed and himself delivered a great many political and forensic speeches. More than 160 orations of Lysias are mentioned by ancient authors; of these, 34 are extant, a few of them

in fragments. In his simple but refined style he presents a contrast to Antiphon. His vocabulary is simple and pure, the vocabulary of common life; he makes little use of showy rhetorical figures, he excels in vivid description; and he passes gracefully from the full and flowing periodic style to that of simple narrative. He was the first to fit the style of the speeches he wrote to the character of the client, who was to deliver them before the court. Isocrates (436-338 B.C.), an eminent teacher of oratory and one of the founders of the art in its highest development, was also by profession a logographer. Twenty of his orations are extant, marked by great elegance of style, but inferior in natural simplicity to those of Lysias, and in fire and fervor to the orations of Demosthenes. To Isocrates Cicero awards the praise of having brought Attic oratory to perfection. Among his pupils were very many who attained high eminence as orators. From the scant records that are extant are gathered the names of 41 famous orators who are known to have come from the school of Isocrates; among them the great Isæus (390-353 B.C.), who, like his master, was a logographer and perhaps the most eminent representative of that profession. He was deeply learned in the law, and was also a great political orator. In forensic oratory he was without a peer. Demosthenes is said by some ancient writers to have been one of his pupils. With Demosthenes and Æschines closes the period of the grand Attic oratory.

After Greece fell under the Macedonian domination Grecian oratory had no longer any arena in public life and it degenerated rapidly. The tradition of the best days was, it is true, preserved in Aristotle's great treatise, and the monuments of Attic eloquence remained, but the virile eloquence of the great orators of Athens was ill fitted for the political circumstances of enslaved peoples. The taste for oratory was industriously cultivated by the Hellenes of Asia Minor and the Greek cities as an elegant accomplishment, and in their hands it became merely one of the arts of decoration. A pompous, florid style, abounding in exquisite figures of speech, extravagant metaphors and empty but sonorous periods displaced the sane, temperate speech of the Athenian masters and exemplars of oratory. And it was while Greek eloquence was in this low estate that the Latins first became acquainted with the arts of Greece. Fortunately the works of the great orators and of the great theoretic expositors of the art, Isocrates, Aristotle, Theophrastus, were still extant, and in them was to be found the corrective of this debased Asian oratory. It was the good fortune of the greatest of the Roman orators, when he resorted to the Greek schools for training in the liberal arts, to have his studies from the first directed to the authentic works of those great masters, and not to the extravagances of the Asian school. Cicero's great rival in aftertimes, the orator Hortensius, was captivated by the glitter of Asianism, and sought to win verdicts in the courts by resonant sentences and flowery rhetoric rather than by clear, calm argumentation commended by a chaste, temperate style of speech. Cicero's orations, of which 56 are extant, are either deliberative and political, delivered in the Senate or the forum, or judicial, forensic, all in defense of accused persons,

with the exception of the memorable four orations against Verres, in which Cicero acts as accuser and prosecuting attorney. He wrote three treatises on the subject of oratory, *De Oratore*, *Orator* and *Brutus*, and there are extant two other treatises relating to the art of oratory, *De Inventione* and *Rhetorica* which have been ascribed to him as author. In the treatise *De Oratore* he expresses his view of what the consummately accomplished orator should be. He must not be the mere rhetorician; neither should he be the mere technical lawyer or the keen political partisan; but he should be the man of thorough education and perfect taste, who can speak on all subjects out of the fullness of his mental store, with variety and copiousness. Such is Cicero's ideal orator, an ideal which unquestionably he approached as nearly as any orator in antiquity, though of course even in his time it stood immensely remote. Though Julius Cæsar, "the greatest name in history," was not by profession an orator, he has been justly rated as second only to Cicero as a master of the art of oratory. It is not to be doubted that had he devoted himself to forensic practice and the oratory of the Senate he would not have been inferior in that career to any of the great orators even of Athens. To Julius belongs the unique distinction of having quelled a rebellion by a speech. Quintilian, born about 80 years after Cicero's death, was a very eminent instructor in the art of oratory and wrote on the subject a practical systematic treatise, *De Institutione Oratoria*, remarkable for its sound criticism and faultless taste.

The triumph of Christianity was in part at least a triumph of oratory: the appointed chief means of disseminating the religion was preaching. The Apostle Paul was an orator of no mean rank. The apologies written in defense of the Christian religion in the 2d and 3d centuries and addressed, most of them, to the Roman emperors by Justin Martyr, Athenagoras, Melito, Apollinaris, Miltiades, Minucius Felix and others were, except that of the last named, in effect harangues written, not spoken. The style is oratorical; but it is oftentimes of the debased Asian kind. Many of the Fathers of the Church, as Tertullian, Cyprian, Athanasius, Basil, Cyril of Jerusalem, the Gregories (of Nazianzum and of Nyssa), Augustine, Ambrose, were eminent as orators no less than as theologians and controversialists. In the Middle Ages the art of oratory played no inconsiderable part when employed for religious instruction or moral exhortation by Bernard, Dominic and his Preaching Friars, Bonaventure, Thomas Aquinas, Berchthold of Ratisbon, Vincent Ferrer and Tauler.

Political oratory was meanwhile in abeyance. It had its revival in England in the times succeeding the Revolution of 1686. Since that time the English bar and the British House of Commons have been almost continuously illustrated by the genius of orators hardly or not at all inferior to those of ancient Athens. It was a crisis in the affairs of the little Syracusan Democracy that gave occasion for the first essay to formulate the laws of the art of oratory; and it is in great crises of states that the highest powers of oratory are called into action. As in England the question of war against the American colonies, the misdeeds of proconsuls

in India, the war with Revolutionary France, Catholic Emancipation, Abolition of the Corn Laws and Liberation of the Blacks, gave inspiration to orators; so here in the United States the questions of Independence, of forming a Constitution, of Nullification, of Abolition of Slavery, of maintaining by arms the Union and of Tariffs, have called into exercise the oratorical powers of our Henrys, Otises, Hamiltons, Clays, Websters, Sumners and Phillipses.

O., 'Making of an Orator' (1906); Quintilian, 'Institutes of Oratory'; Reed, 'Modern Eloquence' (1901); Sears, 'History of Oratory from the Age of Pericles to the Present Time' (1896); 'The Occasional Address' (1897); 'After Dinner Speaking' (1901); Tacitus, 'Dialogues de Oratoribus.'

ORATORY OF SAINT PHILIP NERI.

See ORDERS, RELIGIOUS.

ORB-WEAVER, a spider of the group *Orbitellaria*, represented most familiar by the garden spiders of the family *Epeiridae*, which form their webs on a flat plane in the form of concentric lines of thread sustained by cables radiating from the centre of the coil to various points of support. See SPIDERS.

ORBEGOSO, Luis José, loo-ēs' hō-sā' ōr-bā-gō'sō, Peruvian general: b. Chuquisongo, Huamachuco, Peru, 25 Aug. 1795; d. Lima, Peru, 1847. He was educated in the College of San Carlos, Lima, and entered the militia in 1815. He was a man of wealth and high position and engaging actively into military and political affairs attained great popularity among his countrymen. In 1833 he was chosen President of the republic and though the election was not strictly legal he held the position without interference until 1834 when his predecessor, Gamarra, raised a rebellion against his authority. Several revolts followed and Orbegoso was defeated. He accepted the intervention of President Santa Cruz of Bolivia and the Peruvian-Bolivian confederation was formed with Orbegoso as President of North Peru. When the alliance was dissolved in 1836 he was exiled by Gamarra and his followers, but returned to Peru several years before his death.

ORBIS PICTUS. See COMENIUS, JOHANN AMOS.

ORBIT, in astronomy, the path of a planet or comet; the curve-line which a planet describes in its periodical revolution round its central body. The orbits of the planets are elliptical, having the sun in one of the foci; and the planets all move in these ellipses in accordance

with the law that a straight line drawn from the centre of the sun to the centre of any one of them, termed the radius vector, always describes equal areas in equal times. Also, the squares of the times of the planetary revolutions are as the cubes of their mean distances from the sun. The satellites also move in elliptical orbits. See ASTRONOMY.

ORCA, a genus of whales. See KILLER.

ORCAGNA, ōr-kān'yā, or **ARCAGNOLO**, ār-kān-yō'lō, easel names of Andrea di Cione, Italian painter, sculptor and architect: b. about 1300; d. 1368. He belonged to the school of Giotto as a painter, but his energy and dramatic characterization indicate a great advance on the flatness and conventionality of the Giottoesque style. His main works are three large frescoes, 'The Last Judgment'; 'Hell' and 'Heaven' in the Strozzi chapel of Santa Maria Novella at Florence. In the same chapel is an altarpiece marked with his name and the date 1357. It represents Christ handing the keys to Peter and a book to Thomas Aquinas. In the London National Gallery is his 'Coronation of the Virgin by Christ,' a large altarpiece which originally belonged to the church of San Pietro Maggiore at Florence. All these works exhibit powers of exquisite design, graceful composition and delicacy of coloring. The proportions of the chapel of San Michele and its elaborate tabernacle furnish a magnificent testimony to his powers as a sculptor and architect, for he ranked first in his day as sculptor, painter and architect; and he was also reputed to be an excellent poet and one of the best, if not the best, goldsmith in Italy. His Or San Michele tabernacle is classed among the few very great Gothic structures in Italy. His mosaic work on the façade of the cathedral of Orvieto is among the best of his age. Orcagna's figures are graceful and exceedingly well proportioned and expressive. There has been much trouble in distinguishing Orcagna's work from that of his brother Nardo and also from that of Jacopo di Cione.

ORCEIN, $C_7H_7NO_3$, the chief ingredient of the red and purple dyestuffs known under the name of archil. It is formed by the action of ammonia and oxygen on orcin, $C_7H_5O_3$, and consists of two substances, one having the composition $C_{14}H_{13}NO_4$, the other $C_{14}H_{12}N_2O_3$. When ammonia is added to a solution of orcin, and the whole is exposed to the air, the liquid assumes a dark-red or purple tint by the absorption of oxygen. On acidulating with acetic acid, a dark-red precipitate of orcein is obtained. Orcein is slightly soluble in water and freely soluble in ammonia and fixed alkalis, with a purple or violet color; it is very soluble in alcohol.

ORCHARD, Harry (real name ALFRED E. HORSLEY), American assassin: b. Northumberland County, Ontario, Canada, 18 March 1866. He killed ex-Governor Steunenberg of Idaho with a bomb in December 1905, was arrested, brought to trial, sentenced to death and later received commutation to life imprisonment. He made what purported to be a complete confession in which he admitted himself a forger, arsonist and professional murderer. He claimed to have been employed by the Western Federation of Miners in the commission of his crimes

and laid definite charges against its leaders, Haywood, Moyer and Pettibone, who were tried for complicity in Orchard's crimes, but were acquitted. Orchard's confession, believed to be sincere by Rev. E. S. Hinks, dean of Saint Michael's Cathedral, Boise, Idaho, absolved the general membership of the unions from knowledge of the acts of the leaders, but laid the most serious charges against the officers of the unions. The labor leaders denounced the confession as a conspiracy against labor organizations. It was published in serial form in *McClure's Magazine* and in book form, 'The Confessions and Autobiography of Harry Orchard' (1907).

ORCHARD. A collection of fruit-bearing trees, especially of those bearing deciduous fruits, as the apple, pear, peach, plum, cherry, apricot and quince. For oranges, olives and various cultivated nuts, the term "grove" is probably in more general use. American orchard culture differs widely from European. European conditions require conservation of space and make necessary such artificial methods of training as dwarfing, training upon walls, forming cordons and espaliers, and also that the fruit itself shall be of special attractiveness with respect to size, color, flavor or some other desideratum. As a result, far more hand-work is required in European fruit plantations than in America. In America the intensive methods of Europe are rarely practised, since land is plentiful and cheap, and since the demand is for a large quantity of fruit rather than for fruit of exceptional quality. The trees, therefore, are left more nearly to nature, aided by as little hand labor as possible. As a consequence the orchards of America are the most extensive in the world. According to the United States census of 1900 the total number of fruit trees in orchards was 367,164,694, of which 55 per cent were apple, 27 per cent peaches and nectarines, 8 per cent plums and 4.5 per cent pears. In that year the yield of fruit was valued at \$83,751,840; which was increased, in 1909, to \$140,867,347. This had been increased over 50 per cent by 1917.

During the closing quarter of the 19th century, and especially during the last decade, the management of American orchards was decidedly improved. Prior to that orchards were largely mere adjuncts of the farm, supplying little more than the home need, or at most the small demands of local markets. As a result the trees were allowed, usually, to shift for themselves; harmful insects thrived, plant-diseases spread and the quality of the product was poor. As means of shipment of fruit were improved more distant markets could be supplied and the progressive men began to devote attention to their orchards. Great care is now taken in the selection of land and site for an orchard. Not only must the tree be considered with respect to its nourishment, but the effects of cold, heat, wind, light and other factors must be kept in view. Air drainage has been found to be of equal importance to water drainage. Orchards planted in hollows generally fail because of the settling of cold air from the high ground, and good managers now avoid a situation where no draft of air will tend to keep the trees clear of such chilling influences. The land selected is thoroughly prepared by

plow and harrow before the trees are planted, instead of placing them in separate holes dug in the sod. The trees planted, rarely more than two years of age, are carefully trimmed root and branch, and set in rectangles or hexagons, the latter method permitting cultivation in three directions and being more economical of the land. Instead of allowing the land to grow up with weeds and grass as formerly, modern practice keeps it cleanly cultivated until mid-summer, and in many cases a "cover-crop" is planted for plowing under as a green manure in the following spring. During the first three to six or perhaps eight years, according to the kind of fruit, distances between trees, etc., many orchardists plant hoed crops between the trees to offset the cost of cultivation. Cereals and grasses are now almost never sown in orchards except to reduce the amount of nitrogenous food in the soil and then only when such food is so abundant that the trees are making too great a growth of wood to allow of profitable productivity. The cover-crops act more or less as checks to growth and thus help in the ripening of the wood and the buds. They also serve to hold snow, and to check washing, puddling and leaching of the soil, and if they consist of beans or similar legumes, they enrich the soil with nitrogenous food derived from the air.

Thinning of the fruit has been found of distinct advantage with many kinds, especially when the grower aims to supply the annually increasing demand for finer individual specimens. The objects gained are the removal of inferior, diseased specimens, the destruction of many insect pests and the saving of plant-food which can be utilized by the tree in the development of finer fruits or other parts. It is practised most with such fruits as peaches, pears and apricots, these supplying a fancy market; but is also gaining in favor with apples, plums and cherries. Often the practice removes two-thirds of the fruits set. But the number lost is usually more than offset by the increased bulk of the crop matured, and by the resultant price.

Whereas fruits, even peaches, were formerly marketed in bulk, they are now shipped in small individual packages, even apples being sent to market more and more in smaller packages than barrels. This change has been brought about by the demand of consumers who dwell in cities, where they have small facilities for keeping perishable food-materials and must buy their fruit in small quantities, more often than in large amounts. Means of transportation and storage facilities have developed in pace with this change in the market. Refrigerator cars have made possible the carriage of products hundreds, or even thousands, of miles to a final market, and the erection of cold-storage warehouses at both the shipping and the receiving ends of the line has enabled producers and dealers to control the supply and regulate prices to a great degree. The disadvantage in such a method of marketing fruit is the poor quality of fruits shipped long distances; as they must be gathered before their flavors have fully developed. See AGRICULTURE; FERTILIZERS; FUNGICIDES; HORTICULTURE.

ORCHARD GRASS, a genus of grasses closely allied to the *Festuca*. See GRASSES IN THE UNITED STATES.

ORCHARD ORIOLE. See ORIOLE.

ORCHARDSON, ôrchard-sôn, SIR William Quiller, Scottish painter: b. Edinburgh, 1835; d. 13 April 1910. He entered the Trustees' Academy and encouraged by the success of his exhibits in the Royal Scottish Academy's exhibitions went to London in 1863 where he contributed to the Royal Academy and other art exhibitions. In 1868 he was elected an associate of the Academy, and in 1877 became an Academician. He was knighted in 1907. Orchardson's works consist almost entirely of historical and genre pictures and portraits. Later in life he often chose his subjects from the occupations and activities of the upper classes of to-day in England and Scotland. Some of his chief works are 'The Challenge' (1865); 'Christopher Sly' (1866); 'Napoleon I on Board H.M.S. Bellerophon' (1880), purchased under the terms of the Chantrey Bequest; 'Un Mariage de Convenance' (1884); 'Salon of Madame Recamier' (1885), in which many distinguished persons are introduced; 'The Rift within the Lute' (1887); 'The Young Duke' (1889); and portraits of the bishop of Saint Asaph, Professor Dewar, Viscount Peel, Lord Kelvin and others; for he excelled as a portrait painter. Almost all his paintings appeared in the Royal Academy exhibitions. He was a painter of brilliant technique with few rivals in certain effects of color and chiaroscuro. His coloring is delicate and luminous and he is a very artistic and skilful draughtsman. Consult Armstrong, 'The Portfolio' (London 1895); Little, 'The Art Annual' (1897).

ORCHESTRA, The, and Orchestral Instruments. The word orchestra, of Greek origin, denoted in classical times an open space in which dances were performed to the sound of various instruments. To-day it designates a corporate body of players upon various instruments ruled and directed by a conductor. The name orchestra is applied both to the performers and to the instruments, because, in technical language, the performers and the instruments are identified.

The so-called "Symphony Orchestra" of to-day, consisting of from 60 to 100 musicians, has been a development starting from a simple band, or group, of instruments and finally growing into the complicated body of various and varied instruments that can produce almost every known kind of tone. In the course of time old instruments dropped out gradually and were supplanted by newer ones, a process that is still going on to-day. The Orchestra of to-day consists of four divisions; (1) the "Strings," comprising the first and second violins, the

violas, the violoncellos and the double basses (or bass viols) which double the bass of the violoncellos; (2) the "woodwind," comprising pipes, or tubes, of wood (some furnished with a reed in the mouthpiece) through which the performer blows, stopping the holes on the pipe with his fingers placed on the keys, such as the flute, the clarinet, the oboe, the cor anglais, the bassoon, etc.; (3) the "brasses," comprising the horn, the trombone, the tuba, etc.; and (4) the "percussion," such as the kettledrum, the side drum, the cymbals, the triangle, etc. These are sometimes called the "battery." To this group also belong all miscellaneous and toy instruments that are sometimes called for by composers to give "local color," or to produce peculiar, or weird effects, such as castanets, tambourines, basque drums, cuckoo, xylophone, Hungarian dulcimers, carillon or "glockenspiel," rattles, celesta and tubular chimes. The harp, though not a permanent member, is often called for by modern composers. Liszt was particularly fond of it. The pianoforte, once an important member of the orchestra (as harpsichord), is now an occasional visitor, as are also the reed and the pipe organ.

The orchestra is as old as the music drama, whose first librettists were Æschylus and Sophocles and whose first orchestra was a band of flutes and lyres. The first known record of any kind of concerted group of instruments occurs in the magnificent 'Ballet comique de la Reyne,' performed in France in 1581 at the Château de Moutiers on the occasion of the marriage of the Duke de Joyeuse and Margaret of Lorraine. The instruments were played by the dancers in full costume and were hautboys (oboes), flutes, cornets, trombones, viola di gamba, lutes, harps, a flageolet and 10 violins. These instruments, however, were not combined into a regular orchestra; but were separated into 10 groups ("dix concerts de musique"). The violins were reserved for one particular scene, in which they played alone, five on each side. In another scene Neptune and his followers were supplied with lyres, lutes, harps, flutes and other instruments. In another scene "Jupiter descended from a golden dome in which were placed 40 musicians with new instruments."

The beginning of the orchestra coincides with the revival of the lyric drama (practically, then, a lost-art) toward the close of the 16th century by a little group of men of letters and musicians, who, filled with the culture of the Renaissance, met in Florence at the house of Giovanni Bardi, Conte di Vernio, with the object of resuscitating a form of musical art. This ultimately resulted in the birth of the opera. The meetings were transferred to the house of Jacopo Corsi; and it was in the Palazzo Corsi that 'Dafne,' words by Rinuccini and music by Peri, was privately performed in 1597. No trace remains of this first opera, which was succeeded by a greater work 'Euridice,' the book for which was also by Rinuccini and the music by Peri. 'Euridice' was given for the marriage festivities of Marie de' Medici and Henri IV of France and it was also performed in public in 1600. Several noblemen took part in the performance. Behind the scenes Signor Corsi presided at the harpsichord (gravicembalo) assisted by three friends, who

played upon the chitarone (lute), viola di gamba and theorbo, or large lute. These instruments, with the addition of three flutes used in a certain *ritournella*, or short interlude or "sinfonia" (see ORCHESTRA MUSIC), seem to have comprised the entire orchestra. A considerable amount of freedom must have been allowed to the performers, for in the score, published in Florence in 1600 and reprinted in Venice in 1608, the accompaniment (or orchestral part) consists of little more than an ordinary figured bass.

A more important orchestra had also been used 10 months before the performance of 'Euridice' in Rome (1600), for the performance of the first sacred music drama or oratorio, called 'La Rappresentazione dell' Anima e del Corpo' and written by Emilio del Cavaliere. This work was practically an opera, for it was given with scenes, decorations, acting, dancing, singing and recitative. The orchestra consisted of one lira doppia, one clavicembalo, one chitarone and two flutes. No part was written for a violin; but a note on the score states that a good effect may be produced by playing a violin in unison with the soprano voice. The orchestra was entirely hidden from view; but it was recommended that the various characters should carry musical instruments in their hands and pretend to accompany their own voices and to play the *ritournelli* interposed. A madrigal with full instrumental accompaniment took the place of an overture. These two works, therefore, of the year 1600 mark the entrance of the body of instruments destined to become the Symphony Orchestra. At the beginning of the 17th century a change took place in the orchestra. Old wind instruments began to disappear and new ones to take their places: the delicate viols were deemed old-fashioned and had to give way to the new violin and violoncello. The famous opera of 'Orfeo,' which Monteverde brought out in Mantua in 1607, is considered a landmark in music and from it modern music finds its beginnings. But, although there were many innovations in the music, the orchestra was conservative in the matter of its instruments. In fact 'Orfeo' was the last great work that was written for the conventional orchestra of the Renaissance. The score calls for 40 instruments: two gravicembali (harpsichords), two organi di legno (little organs), one regale (little organ), two double bass viols, three viole di gamba, two chitaroni (deep lutes), two little violins, 10 viole di braccio (soprano, alto, tenor and bass) and a few ordinary violins of the style that Gasparo di Salo and Mazzini were making at this period, a clarino (shrill trumpet), three trompettes (with sordini), four trumpets, two cornets à bouquin, flutes shrill and deep, two oboes, and an arpa doppia (double harp). But although the orchestra in 'Orfeo' showed nothing new in instruments. Monteverde *individualized* the instruments and made them portray the characters of his music drama and intensify their emotions. He used them, moreover, to depict the terrors of Hades and the beauties of the Elysian Fields. Twenty years later when Monteverde produced his opera 'Tancred and Clorinda,' he used a very different orchestra from that of 'Orfeo.' Twenty years had made a great difference in musical instruments and also the choice of them.

In this work Monteverde called for two violins, two viols (tenor and bass) and the contrabasso da gamba (the double bass). Here it will be seen that he had the complete string quartet—soprano, alto, tenor and bass—and also the reinforcing second violin and double bass (doubling the bass). In a still later work called the 'Incoronazione di Poppea,' brought out in 1642, Monteverde used special instruments to produce certain effects; for instance, trumpets and drums for triumphal scenes; flutes for pastoral scenes; and cornets and trombones for fantastic scenes. Monteverde, in fact, used his orchestra so dramatically and so picturesquely that Wagner copied his methods 300 years later in what the world in the middle of the 19th century was pleased to call the "Music of the Future." Of particular interest is the orchestra for the oratorio of 'San Giovanni Battista,' by Alessandro Stradella (17th century), which is said to have been the means of saving his life by melting the hearts of the ruffians sent to assassinate him on the occasion of its first performance in the Church of Saint John Lateran, Rome. The date is said to be 1676. The work opens with a 'Sinfonia,' consisting of three short fugues followed by a recitative and aria for Saint John. The accompaniment to some of the arias, or airs, is most ingenious and complicated, calling for two complete orchestras.

Renaissance Instruments.—The lute, so famous in song and story, was the favorite mediæval and Renaissance instrument. It was distinguished for its beauty of ornamentation as well as for its tone. It has a pear-shaped, or melon-shaped, body or back (proclaiming its Oriental ancestry), a low bridge with sound-post beneath it, a flat belly, pierced with from one to three sound holes in decorative roses and often beautifully inlaid with colored woods and mother-of-pearl. Attached to the body was a long neck, covered by a fingerboard divided with frets of brass, or catgut, into a measured scale. The strings were of catgut until the end of the 17th century, when silver-spun brass strings were introduced. There were "single-neck" and "double-neck" lutes. The latter were known as theorboes, and after a time they banished the "single-neck" variety. These "double-neck" lutes were known variously as archlutes, chitarmoni and theorboes, according to size. The lute is now esteemed chiefly for its beauty of form and the ornamentation of the sound-board, or belly, frequently embellished with inlays of tortiseshell, ivory, mother-of-pearl and rare woods. As the new violin tribe of instruments arose, the lute fell into disuse and finally into oblivion with the viol family, its gentle companions. The violin-makers destroyed many fine lutes for the sake of their valuable wood; but a number of fine specimens have happily escaped destruction and are preserved in museums and in private collections. The lute-player did not use our system of notation. The special system by which his music was noted, written, printed and read by him was called "Tablature."

The "viol family" consisted of four sizes of instruments: (1) the treble, or discant, which always played the melody; (2) the *viola da braccio* (played with the arm), the tenor viol; (3) the *viola da gamba* (leg viol), corre-

sponding to the modern violoncello; and (4) the violone (double bass), the bass viol which doubled the bass of the viola da gamba. From a small variety of the tenor viol, called *violino piccolo*, the beautiful violin was developed. An idea of the variety of tone that could be obtained from a "concert of Viols" is realized when it is remembered that there were six kinds of *viola da gamba*, three for the bass and one each for soprano, alto and tenor—all with frets on the fingerboard. Then there were seven kinds of *viola da braccio* (arm viols), named great quint bass, bass and tenor, and four little ones. Rich amateurs bought entire sets of these instruments. Then there was the *viola d'amore* (love viol), rather larger than the modern viola and supplied with seven catgut strings (the three lowest wound with silver wire) and below the neck and passing under the bridge seven additional strings tuned in unison with the others, vibrated "sympathetically" with them and produced an effect full of mystery and sweetness. Then there was the *viola bastarda* (a large bass instrument with from 12 to 14 strings); and the *viola di bordone*, or *baryton*. The latter had five to seven strings for the bow to set in motion and 24 metal strings under the neck to be played on by the thumb "pizzicato" (plucked). Haydn composed a large number of pieces for the baryton, as it was the favorite instrument of his patron, Prince Esterhazy.

Another instrument of the Renaissance orchestra was the *lira*, a kind of viol with 12 or 14 strings tuned in a very peculiar way, which permitted the player to find all kinds of chords in peculiar positions. Turning now to the wind-instruments, there were then as now two groups of woodwind and brass. The former was known as the Bombardo, Bombardino, Bombardi, Pommer, Chalumeau, Schalmey, Schalmay, or Shawn family. They appeared in various sizes from soprano to bass. At first these instruments were not played directly by the lips, for the mouthpiece was enclosed in a bag. Later the bag was discarded and a reed was placed in the mouthpiece. In some instruments the reed was double; in others single. The type of the instruments with double-reed was a conical tube of wood with a bell at one end and a bent metal tube at the other containing the double reed mouthpiece. There was a quartet of these: the oboe, or *haut bois*, or hautboy (*high wood*), was the treble; there was also an *oboe d'amore*, and an *oboe di caccia*, hunting-oboe (from which the cor anglais is thought to have been developed); and there were many other sizes and kinds that old records and writers refer to generally as shawms, chalumeaux and schalmeyes—all oboes and bassoons of one kind, or another. Old oboes are called for in Bach's scores, but after his time they dropped out of use. Sometimes a modern composer revives one for the sake of eccentricity, as Richard Strauss in his 'Domestic Symphony' writes for the *oboe d'amore*. The other group of wind instruments, also a large one, was known as Zinke. They required such force of lungs to play them that they were rapidly disappearing in Bach's time. These instruments were made of wood covered with leather and had six holes for the fingers and one for the thumb on the lower side. One of the most important was the *cornetto*. Cornetti ap-

pear in many of Bach's scores and are chiefly used to support the voices. All these Zinke instruments were associated with the trombones, or sackbuts. The Renaissance orchestra also included the harpsichord, gravicembalo, or clavicembalo (the name is spelled variously), and small portable organs called *regale*, or *regal*, positive and *organo di legno*. There were also harps and double harps (*arpa doppia*) and two classes of flutes—*flutes à bec* or "block flutes" (that developed into the flageolet); and "transverse flutes," which appear to have superseded the *flute à bec* about 1720. The *flute à bec* had a mouthpiece at the end, like the clarinet. There were eight sizes of *flutes à bec*, ranging from soprano to bass.

All through the Renaissance period and until the time of Lully it was customary to combine instruments of the same class only. Therefore, we read of a "concert of violins" and a "concert of flutes," etc. A "concert of flutes" required more varieties of the flute than we have to-day. Consequently, there were tenor and bass flutes. In Lully's ballet '*Le triomphe de l'amour*' (Paris 1681), there is a quartet of flutes, the lowest part of which is only possible on a bass flute. When the combination of wind and string instruments was found preferable, the feeble bass of the flute was insufficient and the larger kind of flutes, therefore, fell into oblivion.

Modern Instruments.—Various causes have contributed to the survival of certain instruments and the extinction of others. Quality of tone, mechanical practicableness and the fashions in vogue at different periods of combining instruments have been the causes which have preserved certain instruments and abolished others.

The Strings.—No instrument has had so great an influence on the development of the modern orchestra as the violin. It was developed from the *piccolo violino*, a small instrument, whose chief recommendation was a shrill, piercing tone. This was experimented upon by the early violin-makers for many years until at last, under the hands of the Amati family and their pupil, Stradivari, the resonant and sweet-toned violin arose. The great work of the Cremonese makers had been to perfect an instrument that would have a beautiful tone as well as a penetrating one. When the violin took its commanding place in the orchestra, naturally it needed a stronger bass instrument to support it. Therefore, the old *viola da gamba* was developed into the violoncello. For a long time; however, the *viola da gamba* lingered in drawing-rooms; for amateurs were loth to give it up. The tenor viol and the alto viol were combined into one instrument, the viola; and this explains why the viola is today sometimes called the "alto" and sometimes the "tenor." The double-bass, which "doubles" (that is plays in the lower octave the bass part given to the bass voice), is, strange to say, the old violone, or bass viol, with a few changes. It is still called "bass viol." It retains the characteristics of the old viol family: a flat back (instead of the arched back of the violin family), and the slanting shoulders of the old viols. On the other hand, it has yielded to the shape and position of the *f* holes and the four corner blocks and general shape and curve of the waist.

In 1676 Scarlatti used a double orchestra consisting of two solo violins and violoncellos for the first and a large body of accompanying violins, tenors and basses for the second. In Scarlatti's time the strings—violins, viola, violoncello and double-bass—constituted the real body of the orchestra. The wind-instruments were accessory and used only to give effect and variety.

2. *The Woodwind*.—The woodwind family consists of wooden tubes, or pipes, through which the performer blows. Most of these have reeds. These are subdivided into two groups: double-reed and single reed. The double reed instruments comprise the oboe, cor anglais and bassoons; the single reed instruments, the clarinet tribe. All have a curious nasal, melancholy quality of voice, which was characteristic of the old chalumeaux or shawm family. The oboe is the most complicated of all the reed instruments. It is made in three pieces screwed together, forming a wooden pipe, or tube, with conical bore that widens out into a bell, shaped like a morning-glory. Along this tube are two "speaker-keys," worked by metal rods. The mouthpiece, called "staple," is supplied with a reed. The reed consists of two blades of thin cane attached by silken threads. The cor anglais is the tenor, or alto-oboe, standing in the key of F, a fifth below the oboe. It ends in a kind of ball instead of a bell and the mouthpiece containing the double reed is bent at right angles. The name is derived or corrupted from *anglé* (bent) and corrupted into anglais: the English (*anglais*) have had nothing to do with the development of the instrument. It should, therefore, never be referred to as "English horn" but as *cor anglais*. The oboe and cor anglais assumed their present appearance about the same time. They both preserve the peculiar harsh, plaintive family voice. The bassoon, the bass of the oboe group, has the same general tone on account of the double reed; but it has a comic quality about it and might almost be called the clown, or joker, of the orchestra. Mozart fixed the place of the bassoon in the orchestra: first and second and double bassoon, an octave below the regular bassoon, doubling the bass, just as the double bass doubles the violoncello.

The clarinet has a *cylindrical* bore and a single reed. From a crude instrument of two keys and seven holes, has evolved the present day clarinet with 17 keys and 21 holes, seven of which are covered directly with the fingers and the others by keys. The basset-horn is the tenor clarinet, with two additional keys and a longer bore than the clarinet, taking its name from a German named Horn, who made a little bass clarinet in 1770 and named it for himself. Mozart used it often; for he loved all clarinets. The bass clarinet resembles the ordinary clarinet, only the bell is turned upward. This is doubled by the contrabass clarinet, a big instrument over 10 feet long, folded up and ending in a big metal bell turning upward. The latter is also called the pedal clarinet.

The flute has no reed. It is a tube of three pieces called "joints." On the lower part are six holes to be stopped by the fingers. At about an inch from the head is a hole, across which the performer blows, i.e. throws the "air-

stream" of his preath against the outer edge of the hole, *obliquely*. Formerly the flute had no keys or levers. Its system of keys was developed between 1823-1847 by Theobald Boehm, who continued the experiments begun by a Captain Gordon of Charles X's Swiss Guards. The flute is now a complicated instrument of marvelous agility. Sometimes it is made of silver. Modern composers usually demand two flutes and a piccolo. The piccolo is the little flute. It should properly be spoken of as the *piccolo flute*. It plays the upper octave of the flute, of which it is less than half the length. Its voice is shrill, wild and piercing.

3. *Brasswind*.—The brasswind consist of the French horn, trumpet, trombone, bass tuba, etc. The French horn was introduced into the orchestra about 1720. It is derived from one of the most ancient instruments. The horn is represented in painting and sculpture in the monuments of Assyria, Egypt and India. Originally the horn was taken from the head of an animal, or it was the tusk of an elephant, whence its name "oliphant" in the inventories of the Middle Ages. At first, it had no mouthpiece. The Romans had a huge metal horn, called Bucina, or Cornu, which was curved spirally and wound around the performer's body. In the old hunting-horn this idea was still followed: the tube passed over the player's right arm with the bell projecting over his left shoulder. This instrument was carried from the hunting-field into the orchestra without change. Haydn and Mozart showed the world its possibilities; and then Weber, Mendelssohn and Wagner made poetic and dreamy use of it. The horn was used in its simple form until after 1830, when valves, or pistons, were added. The instrument then became known as the "chromatic horn."

The horn of to-day consists of a great tube, over seven feet long, curved spirally for the performer's convenience of holding it. This tube becomes narrow toward the mouthpiece and widens toward the huge bell. The horn has no reed. The performer's lips do all the work. The "crooks" are movable pieces of tubing inserted into the coils to alter the pitch. There are "crooks" for all keys. The right hand of the player is always placed in the bell to prevent harsh sounds and to produce a sweet, veiled quality of tone. The family of horns is now complete; there are horns in all keys. The modern orchestra usually has two horns; but for some compositions six or eight are required.

The trumpet is a descendant of the clarion. It is practically the soprano of the horn family, but it moves in a higher region than the horn. Like the horn, it is a "transposing instrument" (i.e., music written does not represent the real sounds); but, unlike the horn, it produces only "open sounds." It has a number of "crooks," or lengthening pieces. The scores of Bach and Handel call for many trumpets, because in their day the improvements had not been made that allowed one instrument to play all the notes required. When "keys" were added, it became possible to perform all difficult passages on the trumpet with ease and agility; and the orchestra, therefore, could dispense with the great number of trumpets, until then required. The trombone is a descendant of the old sackbut of

the Hebrews and Egyptians. Sackbuts were made in all sizes during the 16th century. The bass sackbut has come down almost without change to the trombone. The trombone is a slender, brass tube bent twice upon itself and ending in a bell. The two outer portions "slide" upon the inner one. There are seven "positions" for the "slide," each giving a fundamental tone and its harmonies. There are three varieties of the trombone: alto, tenor and bass. As a rule, there are three tenor trombones in the orchestra, but no alto nor bass. The bass tuba is an enormous instrument with a great bell standing upright, supplied with valves and a horizontal mouthpiece. It is over three feet long. It is a descendant of the "serpent" of the Zinke family with the ophicleide (serpent-key) as the connecting link. Wagner made great use of the bass tuba, the deepest voice in the orchestra, the tone partaking of trombone and organ. It has a compass of four octaves, and, having pistons, is a chromatic instrument (i.e., can play sharps and flats). Wagner gave the name *tuben* to a whole family, of which, however, the bass tuba is the only true tuba. Wagner's intention was to introduce a new tone color into the orchestra akin to that of the horns. These new instruments are *modified horns* and are arranged in two pairs—a high-pitched pair and a low-pitched pair. Wagner called them "tenor tuben" and "bass tuben," which has added some confusion to modern nomenclature. There are many other kinds of brass instruments that belong to the military orchestra, but have no place in the symphony orchestra.

4. *Percussion in the Symphony Orchestra.*—There are two kinds of percussion instruments: those that produce musical notes and those that produce only *noise*, not notes. All of these are beaten or shaken. First of the percussion instruments that produce *notes* are the kettledrums. The kettledrums are big copper basins, or bowls, over the heads of which a parchment is stretched, which, by means of screws, can be tuned to a musical note of definite pitch. They are ancient and were brought by the Crusaders from the East. The other drums are the "side" or "snare" (the military drum) with parchment heads and "snares" of catgut, and the big bass drum which always stands sidewise, and which is struck with a stick ending in a soft, round and padded knob. The larger the drum, the more resonant the sounds. The triangle is a steel rod bent into three sides as the name shows. It is tapped with a "beater." The sound is clear and sometimes silvery. The pitch is indefinite. The cymbals are round, thin plates, or discs, of copper, or brass, with a strap attached on the outside of each plate for the convenience of the player. Cymbals are rubbed together, or clashed. Cymbals were known to the Egyptians, Greeks and Romans. The tambourine, a wooden hoop over which a parchment head is stretched and hung with little, metal plates called "jingles" or "bells," is shaken, struck with the knuckles, or rubbed. It is sometimes called "tambour de basque." The tambourin is a long, narrow drum, which the performer beats with one stick. This is the old mediæval "tabor," which was hung around the neck of the player by a cord and played with one hand, while he held the flageolet in the

other. This was the famous "pipe and tabor" combination that the wandering minstrel often played and which even performing animals were taught to acquire. Castanets are two hollow pieces of wood held in each hand of the performer, who clicks them together. They make deep, hollow notes. They get their name from the Spanish word for chestnut, *castaño*, from the wood of which they are usually made. Spanish dancers use them to accent the rhythms as they dance; and they are often introduced in Spanish music to give "local color." When a bell is required in the orchestra, composers give the impression of a deep toll, or a silvery chime, by some ingenious device. Saint-Saëns has in his 'Danse macabre' notes plucked on the harp to sound 12 o'clock; and Wagner for the 'Bells of Montsalvat' in 'Parsifal' originated a row of steel pipes called "tubular chimes." The chime of bells that we often hear in certain pieces, and called, indeed, *carillon*, or *glockenspiel*, is made of a series of graduated bars of steel, or bronze, which are struck by two small hammers.

Even more silvery resonant, and bell-like is the new instrument called the *celesta*, which was introduced by Tschaiowsky and seized upon with avidity by Richard Strauss. The celesta is a square instrument resembling an upright piano, or parlor organ. It has a keyboard, like the piano, and also pedals. The sounds produced are fairy-like and charming. The *xylophone* is a primitive instrument, still used by uncivilized tribes. It consists of graduated slabs of wood, on the principle of the child's toy harmonica and the *glockenspiel*. Sometimes a watchman's rattle—the cogwheel revolved against a hard, but flexible spring of wood, or metal—is used. When an anvil is required, as in 'Das Rheingold,' to give an idea of the work of the Nibelungs, steel bars are used. These are struck by a metal "beater."

In the 'Don Quixote Variations' Strauss introduces a "wind-machine,"—a sort of barrel with some of the staves taken out and the space covered with black silk. This is revolved rapidly by means of a handle; and the silk coming into contact with some cardboard or wood conveniently placed for the purpose, makes a rushing, swishing noise like the wind blowing violently. The cuckoo is a toy instrument consisting of two tiny pipes mounted on a pair of tiny bellows. A plug is pushed in and pulled out to get the sound "cuck-koo"; Haydn used it in his 'Toy Symphony'; but Beethoven in his 'Pastoral Symphony' imitated the sound of birds more artistically than by direct imitation. In this great work the clarinet calls cuck-koo in a realistic manner, while the nightingale replies on the flute and the quail answers on the plaintive oboe.

Evolution of the Orchestra.—The first great orchestra, certainly the first that has come down to posterity in records, originated in France in the days of Louis XIII. It was called the "Twenty-four Violins of the King" and reached its climax of perfection in the time of Louis XIV. The "Twenty-four Violins of the King" played in court entertainments, particularly the splendid ballets; in churches; in gardens; at supper; and for the king and his court to dance. Although called "Twenty-four Violins," the orchestra consisted of violins, altos, tenors,

basses and it often played under Lulli (1632-87). Lulli was the first great conductor. He trained his men carefully and gave particular attention to "the first stroke of the bow." People travelled from England, Germany, Italy and elsewhere to hear Lulli's orchestra. Everybody admired the correct playing, the splendid rhythm, the perfection of the ensemble and the sweetness of the violins. Lulli beat time with a cane and created the traditions in conducting an orchestra which are in use to-day. Lulli's orchestra was large. Its chief instruments were violins in five parts; flutes—straight flutes *à bec* and "transverse," or "german"—oboes, bassoons and double bass viols. "All these parts sounding together" writes a contemporary, "make a symphony so precise and agreeable that whoever hears the 'Twenty-four Violins of the King' play all kinds of airs and dances confesses willingly that he never heard such suave and delicious harmonies before." Contemporary literature is full of allusions to this famous organization. Hardly less famous was the orchestra called "Petits-Violins," which Louis XIV created for Lulli in 1655. At first it consisted of 16 players; but afterward it was increased to 21. This "Twenty-Four Violins" and the "Petits-Violins" often played together, making one large orchestra. Sometimes Lulli added bag-pipes, guitars and hunting-horns, and once he introduced anvils (which the composer of 'Rheingold' and 'Siegfried' followed).

In the time of Corelli (1653-1713), the violin family became the very backbone of the orchestra. Corelli was a great violin virtuoso and a composer. People forget that he was an orchestral conductor of the first order. His orchestra in Rome was famous. Scarlatti was struck with his "nice management of his orchestra and the uncommon accuracy of his whole performance"; and Geminiani relates that "Corelli considered it essential that the bows should move exactly together up or down, and at his rehearsals he would immediately stop if he saw one irregular bow." Alessandro Scarlatti (1659-1725), was of importance to the development of the orchestra, not so much because of his conducting but because he wrote such fine orchestral accompaniments to the airs in his operas. The strings always formed the groundwork of his scores; but he also used oboes, flutes, bassoons, trumpets, drums and what was then unusual in Italy, *horns*. He often divided the strings into four parts and carefully balanced them with the wind instruments, but the latter were always subordinate to the strings. Rameau (1683-1774), also extended the technique of the violins and introduced many new effects, for example *pizzicato* (plucked) chords. He also used the woodwind in a delicate and enchanting manner.

Thus the orchestra had reached fine development with regard to technique and emotional expression in both France and Italy long before the Germans began to influence European music. John Sebastian Bach (1685-1750) stands between ancient and modern music. Bach's contribution to the development of the orchestra is that he treated each separate instrument as if it were an individual and prepared the way for occasional solos in orchestral compositions. Bach wrote for a great many instruments which

were going out of fashion even in his time, such as the oboe d'amore, the oboe di caccia, the viola d'amore and the viola da gamba.

Handel (1685-1751), more of a cosmopolitan than Bach, made his orchestra a strong ally of his singers, whether in opera or oratorio, in both of which he became so famous. Handel conducted at the clavier, or organ, and improvised what might be called a filling in of musical arabesque work. Handel's orchestra consisted of a smaller stringed band than we are accustomed to use to-day; but the violins were reinforced by a greater number of oboes and the basses by a far stronger body of bassoons. Flutes were chiefly used as solo instruments, but sometimes they played in unison with the oboes. The bass instruments were trumpets (doubled *ad libitum*) with drums for their natural bass; horns and trombones (alto, tenor and bass), when the character of the music called for them. The harp, viola da gamba and other instruments that may be described as "soft" were occasionally used for obligato accompaniments, in which they sometimes played an important part. The organ was used throughout. Its part was provided for by the figures of the thorough bass, which served also for the harpsichord. With these means at his command Handel was able to accomplish all that his fiery genius suggested. His orchestra was divided into three sections: (1) the Concertino, two violins and violoncello; (2) the Concerto Grossi, eight first violins, eight second violins, six violas, four to six violoncellos and four double basses; and (3) the Ripienist, or supplementary bass, consisting of six first violins, six second violins, four violas, three to four violoncellos and three basses.

Handel always sought for novel effects. He was the first to assert the personality of the violoncello; he appreciated the fantastic character of the bassoon; he loved the quality of the oboe; and he brought out the kettledrums on several occasions. He used them as a solo for Jupiter's oath in 'Semele.' Handel was considered "very noisy" in his day. Next came Gluck (1714-87), who banished the harpsichord from the orchestra; introduced the harp; employed the clarinet with superb effect, and used the orchestra to add force to a dramatic situation. "Gluck gave the orchestra a new life," writes Tiersot. "With him violins, oboes and trombones are not merely sonorous agents. They are living entities, personages of action. Through the orchestra he adds dazzling beauty to a temple scene, or a scene in the Elysian Fields; and by little touches on certain instruments here and there he can make us feel the mystery of the infernal regions. Gluck's great gift to the orchestra was to make it speak." Haydn (1732-1809) was fortunate in having such a patron of music as the Prince of Esterhazy, in whose magnificent home he lived for 30 years, conducting an orchestra of his own. When Haydn went to Eisenstadt the orchestra numbered 18 instruments. It was greatly enlarged as the years went by. The last symphonies that Haydn wrote are, therefore, much richer than his early ones. Haydn has been called "the Father of the Orchestra." Haydn fixed the form of the symphony. Mozart and Beethoven were his pupils and followers, yet Haydn learned much from Mozart in the way of

writing for instruments. Haydn's orchestra consisted of the string-quartet, two flutes, two oboes, two clarinets, two bassoons, two horns and two trumpets. He left the orchestra in shape for Beethoven to carry still farther. Haydn outlived Mozart; and his last symphonies show the influence of Mozart. Mozart (1756-91) drew surprising and new effects out of the orchestra by his discovering that every instrument had its individual voice or quality of tone. He gave the orchestra what we may call "tone-color." To Mozart a violin was a violin, a flute a flute and so on; and he wrote characteristically for each instrument. Mozart made great use of the clarinet.

The orchestra as left by Mozart and Haydn consisted of first and second violins, viola, violoncello and double bass, two flutes, two oboes, two bassoons, two horns, two trumpets, kettledrums, and, occasionally, two clarinets. Neither Haydn nor Mozart used trombones. As an exception Mozart used them in the last scene of 'Don Giovanni.'

In the First Symphony Beethoven (1770-1827), for the first time in the history of the orchestra, tuned the kettledrum in the key of the dominant instead of the key of the movement. In the 'Eroica' (Third Symphony) he introduced three horns,—a novelty! In every way Beethoven discovered and brought forward the capacities of each individual instrument. He gave each instrument a new dignity and a new standing. The viola, violoncello, double bass, horn, trombone and kettledrum were all brought forward and made solo instruments. The place of the clarinet also became established. No composer ever made the instruments converse as Beethoven. No composer ever made the strings so flexible, humorous, gay and languorous. Beethoven also was the first to take the violins up into the highest register—into the ethereal domain which Wagner exploited so marvelously. Weber (1786-1826) developed the woodwind and made poetic and romantic combinations. He loved the clarinets; made a ravishing use of the horns; and often subdivided the violins. Weber pointed out many ways of which Wagner made use. With Beethoven four horns and three trombones were exceptional. Weber made this number the rule. Schubert (1797-1828) wrote in novel way for the trombones and used the woodwind beautifully. Mendelssohn (1809-47) gave clarity, polish and balance to the orchestra, besides writing beautifully and individually for each instrument. Mendelssohn was a marvellous conductor. The influence of Hector Berlioz (1803-69) cannot be overestimated. He is called the "Father of Modern Orchestration." Berlioz discovered the value of pianissimo brass effects; the ethereal charm of harmonies on divided violins; the true worth of the viola; brought the harp back into the symphony orchestra; grouped instruments into families to get chords of rich and different shades of tone-color; substituted the tuba for the coarse ophicleide; divided the strings; and advocated the sunken and hidden orchestra, which Wagner realized in his theatre of Bayreuth. Liszt (1811-86) followed Beethoven, Berlioz and Wagner in his orchestration, which is always rich, heavy and full of "color." Liszt made great use of the harp. His Hungarian blood

showed itself in his stirring rhythms. Liszt also invented the Symphonic Poem. (See ORCHESTRA MUSIC). Richard Wagner (1803-83) developed the art of orchestral coloring to a point before him unknown and undreamed. In addition to the new combinations that he devised among the instruments of the classic orchestra he introduced new elements, notably the tubas, a family intermediate between horns and trumpets, and the bass trumpet which figures in nearly all of his scores. He also greatly enriched the family of brasses.

In Lohengrin, Wagner uses, in addition to the usual strings, three flutes, one piccolo, three oboes, one cor anglais, three clarinets, one bass clarinet, three bassoons, three trumpets, four horns, three trombones, one bass tuba, three kettledrums, side drum, cymbals, triangle, tambourine and harp. On the stage and behind the scene he has two flutes, one piccolo, one oboe, three clarinets, two bassoons, four trumpets, three horns, three trombones, kettledrum and cymbals.

Tschaikowsky (1840-93), as a rule, kept to the old Beethoven orchestra, with the addition of the bass tuba. His prominent use of the low woodwind combined with violas and clarinets in their *low range*, with bassoons in their *upper range*, accounts in part for his weird and gloomy orchestral effects. Tschaikowsky's instrumentation is particularly novel in his 'Casse Noisette Suite' (Nut cracker), in which he introduced the celesta (see above).

Richard Strauss (1864) has carried the ideas of Wagner still farther. His compositions tax the skill of performers to the utmost; for the Strauss orchestra requires virtuoso performers for the smallest instrument. The "battery" (instruments of percussion) has with Strauss acquired a new prominence. Strauss also calls for many new and unusual instruments. His 'Don Quixote Variations' carry instrumentation as far as possible unless a Chinese orchestra be called on the field. Strauss intricately divides his various instrumental choirs, setting one group in opposition, or juxtaposition, to another, producing the most marvellous acoustical effects and almost staggering the brain and deafening the ear when the entire orchestra is invoked.

Of striking contrast is the orchestra of Debussy (1862-1918), who gets the greatest effect with the simplest means. To produce these effects Debussy employs many old scales and harmonic chords. His orchestra for 'Après midi d'un faun' is composed of three flutes, oboes, clarinets, four horns, two harps, antique cymbals and strings. Debussy's instrumentation is diaphanous, ethereal, delicate and opalescent in color. With the modern French composers orchestral music seems destined to enter new realms; and there is a tendency to revive some of the antique instruments of the Renaissance. Modern ears seem to be tiring of great concussions of sound and to long for more subtle and poetic qualities of tone. *Beauty* rather than *force* seems to be the goal of the most up-to-date composers and conductors. See BAND; BAND, MILITARY; MUSICAL INSTRUMENTS.

The principal Symphony Orchestras of the United States are, in order of their foundation: Philharmonic Society of New York (1842);

Symphony Society of New York (1878); Boston Symphony (1881); Philadelphia Orchestra (1900); Chicago Symphony (1891); San Francisco Symphony (1894); Cincinnati Symphony (1895); Los Angeles Symphony (1897); Minneapolis Symphony (1903); Saint Louis Symphony (1904); Saint Paul Symphony (1905); Denver Symphony (1906); Seattle Philharmonic (1909); Denver Philharmonic (1911); and Kansas City Symphony (1912).

ORCHESTRA MUSIC. The forms of music written specially for the orchestra have developed and changed in accordance with the evolution and development of orchestral instruments.

Symphony.—The most important of all orchestral compositions is the symphony, not only because of its breadth and dignity of form, but because the greatest composers have chosen it as the vehicle to express their highest musical ideas and their deepest emotions. The word *symphony*, *sinfonia*, or *sinfonie*, was originally used to denote any passages of music that were thrown into relief, as it were; or, in other words, purely instrumental passages in works whose chief interest was concentrated in the voice, or voices. Whenever the instruments, or instrument, played without the voices their work was called a symphony, or symphonies. Gradually the word symphony was used to describe the introductory movement, or prelude; and, in the course of time, it was used in the particular sense of describing the big composition (in four separate divisions, or movements), which reached its greatest climax in Beethoven. The evolution of the symphony forms a long chapter in the history of music. In those introductions to his operas that Lulli (1633-87) produced in Paris, which became known as

"Overtures in the French style," consisting of alternate quick and slow movements, usually dances, the germ of the symphony is found. Sometimes the symphonies composed for certain operas were of sufficient beauty and interest to warrant their performance in concerts. In early days the forms of music were more or less related. Madrigals, fantasias and dances were often strung together loosely. Out of this arrangement the suite was developed; and from the suite arose the majestic symphony.

Various early composers produced symphonies that to-day are interesting only to the student. The Bach family were pioneers in this form; but it was Joseph Haydn (1737-1809) who enlarged the sphere of the symphony, determined its form and developed its capacities of expression. From 1775 to 1794 Haydn wrote more than 40 symphonies, some of which—the 'Military,' the 'Farewell,' etc.—are still played. Next comes Mozart (1756-91) with 49 symphonies, of which the most famous are the 'G-minor' and the 'Jupiter.' Mozart, keeping to the form as arranged by Haydn wrote more than 40 symphonies. Next comes Beethoven (1770-1827) with his nine masterpieces, including the 'Eroica,' the 'Fifth,' the 'Pastoral,' the 'Seventh,' and the 'Ninth,' or 'Choral,' carrying the form of the symphony to the highest climax of majestic expression. Since Beethoven's day the symphonies that are played by modern orchestras are: Mendelssohn's 'Italian' and 'Scotch'; Schumann's works; Raff's 'Lenore' and 'Im Walde'; Schubert's 'C' and 'Unfinished'; Rubinstein's 'Dramatic'; and 'Ocean'; Brahms's four great symphonies; Berlioz's 'Harold in Italy,' 'Romeo et Juliette,' and 'Symphonie fantastique'; Liszt's 'Dante' and 'Faust'; Dvorak's 'From the New World'; Tchaikowsky's six colossal works, including the 'Polish' and the 'Pathetic'; César Franck's 'Symphonie in Re Mineur'; Richard Strauss' 'Aus Italien' and 'Symphonie Domestica'; and works by Gustav Mahler, Sibelius, Sinding, Saint-Saëns, Vincent d'Indy, Chausson, Chabrier, Sgambati (Symphony in B), Scriabine, Balakireff, Borodine, Glazounov, Rimsky-Korsakoff, and other French and Russian composers.

Overture.—Although this name was originally given to the introduction to an opera, oratorio, or drama, the form and name have also been applied extensively to orchestral pieces intended solely for concert use. Formerly a simple movement (or, indeed, sometimes an entire symphony) from a symphony was called on the program "Grand Overture" or simply "Overture." For example, Haydn's symphonies are thus described on the programmes of Salomon's London Concerts of 1791-94. Among the famous overtures that have been composed for independent performance are Beethoven's 'Weihe des Hauses,' written for the opening of the Josephstadt Theatre, Vienna, in 1822; Schumann's 'Bride of Messina,' 'Julius Caesar,' Festival Overture and 'Manfred' (written with incidental music to Byron's poem); Schubert's 'Rosamunde' (1823); Mendelssohn's 'Hebrides' ('Fingal's Cave'), 'Calm Seas and Prosperous Voyage,' 'Melusine' and 'Midsummer Night's Dream' (afterward supplemented by incidental music);

Bargiel's 'Overture zu einem Trauerspiel' (op. 18); 'Medea' (op. 22) and 'Prometheus' (op. 16); Gade's 'Hamlet' and 'Michelangelo'; Goldmark's 'Sakuntala'; Elgar's 'Froissart' and 'Cockaigne' (London Town); and Tschai-kowsky's 'Triumphal Overture on the Danish National Hymn'; 'Storm,' written for Ostrovsky's drama; 'Hamlet,' overture-fantasie; and 'Romeo and Juliet,' overture-fantasie.

Overtures, which, although written for operas, are frequently heard on the concert stage are: Gluck's 'Alceste'; 'Iphigenie en Tauride,' and 'Iphigenie en Aulide' (perhaps the finest specimen of a dramatic overture); Mozart's 'Idomeneo' (1781); 'Die Entführung aus dem Serail' (1782); 'Nozze di Figaro' (1786); 'Don Giovanni' (1787), and 'The Magic Flute' (1795); Cherubini's 'Medea' (1797); Mehul's 'La Chasse du Jenne Henri' (1797); Beethoven's 'Coriolan' (1807), 'Egmont' (1810), and the four overtures to *Fidelio* (1806-07), of which 'Leonore,' No. 3, is the most famous; Weber's 'Preciosa' (1820), 'Der Freischütz' (1821), 'Euryanthe' (1823), and 'Oberon' (1826); Spohr's 'Jessonda'; Rossini's 'Giulianne Tell' (1829); Berlioz's 'Benvenuto Cellini' and 'Carnaval Romain,' both for the opera of 'Benvenuto Cellini' (1838); Nicolai's 'Merry Wives of Windsor'; Wagner's 'Flying Dutchman' (1843), 'Tannhauser' (1845), 'Lohengrin' (1850), 'Tristan and Isolde' (1865), 'Die Meistersinger' (1868), and 'Parsifal' (1882); Smetana's 'Die verkaufte Braut'; and Tschai-kowsky's 'Tempest,' 'Francesca di Rimini,' and 'Fatum' ('Destiny').

Symphonic Poems.—Symphonic poem is a name that Liszt invented for a new form of music that originated with him. In the symphonic poem the movements are not divided but lead continuously into one another and the music is descriptive of a place, a person, or a poetic idea. Liszt applies the title first to his 12 symphonic poems: 'Ce qu'on entend sur la montagne' (Victor Hugo), Tasso, 'Les Preludes,' 'Orpheus,' 'Prometheus,' 'Mazeppa,' 'Fest klinge,' 'Heroide fuæbre,' 'Hungaria,' 'Hamlet,' 'Hunnenschlacht' (Battle of the Huns), and 'Ideale.' Saint-Saëns followed with his Symphonic Poems: 'Le Rouet d'Omphale,' 'Phaeton,' 'Danse macabre,' and 'La jeunesse d'Hercule.' The form is very popular with modern composers and brilliant examples are Richard Strauss's 'Don Juan,' 'Macbeth,' 'Tod und Verklärung,' 'Till Eulenspiegel,' 'Also Sprach Zarathustra,' and 'Ein Heldenleben'; and César Franck's 'Le chasseur maudit' ('Wild Huntsman'). Loeffler's 'La mort de Tintagiles' also deserves mention.

Modern tendency is to escape from the shackles of form and to produce, as it were, impressionist studies in music. Hence the old Suite which once was composed of dance-forms of the strictest kind—allemandes, giques, sarabandes, courantes, minuets, pavaues, branles, gavottes and passepieds has been chosen for many imaginative flights on the part of modern composers. Among these should be mentioned Bizet's 'L'Arlésienne,' incidental music for Daudet's drama; Grieg's 'Peer Gynt' for Ibsen's drama; Charpentier's 'Impressions of Italy'; Tschai-kowsky's 'Mozartiana' and his celebrated 'Casse Noisette' (Nutcracker Suite), adapted from his music to Hoffman's fairy tale, consisting of 'Overture Miniature,' 'March,'

'Dance of the Sugar Plum Fairy,' 'Russian Dance,' 'Arab Dance,' 'Chinese Dance,' 'Mirliton' and 'Dance of the Flowers.' The 'Casse Noisette' suite is considered a masterpiece, exhibiting novelty of treatment, lovely melodies and quaint instrumentation. To this group of imaginative and poetic orchestral music belong Debussy's 'Prelude Symphonique' to Mallarmé's 'Après midi d'un Faune'; Maurice Ravel's 'Mother Goose,' a "toy suite"; Albert Roussel's 'Le festin de l'araignée' and 'Evocations,' inspired by a trip in the Far East; Rimsky-Korsakoff's 'Antar,' suite, and 'Scheherazade,' an Arabian Nights suite; Scriabine's 'Poem of Ecstasy,' and John Alden Carpenter's 'Adventures in a Perambulator,' suite.

The theme and variations reaches its highest development in Richard Strauss's 'Don Quixote,' which exhibits all the resources and peculiarities of modern instrumentation. Vincent D'Indy's 'Istar' (Variations) is also played frequently.

Ballet-music from classic operas holds a place in the modern orchestral repertory. Serenades, capriccios and such works as Debussy's 'La Mer' called "a symphonic sketch," Paul Dukas's 'L'apprenti sorcier,' called an "orchestral scherzo," and Granville Bantock's 'Pierrot of the Minute' show a tendency toward beautifully written orchestral works of light style but masterly in treatment and demanding the most finished work from all the performers in the orchestra. All of these are outgrowths of Liszt's innovation in the symphonic poem and that other form which he named so happily "Rhapsody." Liszt's 'Hungarian Rhapsodies' (orchestrated from his piano compositions) threw a new life and fire into orchestral composition.

One more form frequently appears on the programs of orchestral concerts—"The March." Among the best examples of marches are Tschai-kowsky's 'Slavic' and Liszt's 'Rakocsy.' The 'Rakocsy March' on the national Hungarian theme also occurs in the selections in Berlioz's 'Damnation of Faust,' selections from which are often played as a sort of suite including the 'Will o' the Wisp' and 'Dance of the Sylphs.' Berlioz's delicately orchestrated 'Queen Mab Scherzo' from the 'Romeo and Juliet' symphony is often performed independently.

ORCHESTRION, ôr-kēs'trī-ôn, a mechanical musical instrument of the pipe-organ variety in which orchestral instruments are imitated and assimilated by skilful mechanism. Its invention by Michael Welte and its first exhibition at Karlsruhe dates from 1849. Since then considerable improvements have added to its usefulness as a substitute for an orchestra in places of amusement. Chief of these improvements was the substitution in 1887 by the inventor's son Emil of his patented perforated roll with pneumatic action for the original unwieldy and expensive wooden cylinders. In 1904 Emil's nephew Edwin exhibited the Welte-Mignon pianoforte with the pneumatic perforated roll attachment, autographically reproducing with perfect accuracy the technique of famous pianists. In 1912 the attachment to a pipe instrument produced the Philharmonic Organ. See MUSICAL INSTRUMENTS, MECHANICAL.

ORCHID, ôr'kîd, the name of a group of *monocotyledonous* plants (order *Orchidaceæ*) containing more than 12,000 known species and many thousands of varieties, many of which are highly valuable commercially. They are as a whole by far the most interesting order of plants of the entire vegetable kingdom, because of their extraordinary mode of growth and existence, their great age and endurance, their curious habits and the varied forms of their flowers, which are distinct from all other classes of plants, fine in texture and of glowing and exquisite colors. They are remarkable also because of their ready adaptability and free permission of cross-breeding or cross-fertilization, which also practically makes them more fascinating than all other orders or tribes of plants. This is true in their natural habitat, as well as under practical cultivation. This fact also accounts for the almost endless varieties of flowers and colors.

The flower of the orchid as a rule is made up of the following parts: sepals, petals, labellum or pouch, and column or crest, resting on the modified hollow ovary, and bearing the one or two stamens and the two or three stigmas. The pollen-grains are aggregated into peculiar pollen masses. The structure of the flower is a modification of the typical three-part pattern of the lilies. A secondary bilateral symmetry is imposed on the flower, and four or five out of the original six stamens and one of the stigmas are suppressed. Often the flower undergoes a secondary torsion, inverting its position. The labellum, which is a modified petal, is as a rule the most conspicuous part, and is the most wonderfully constructed, as well as the most important, organ of the flower, since through it insects, when in search of the sweet juices stored inside the spur or walls of the flower, are attracted and guided to the nectar and thus accomplish the benefits of cross-fertilization. It is in this way that so many new varieties are produced by the unconscious work of insects, and these are termed "natural hybrids" and are collected and brought to us from tropical wilds. But under cultivation this important work must be done by experts, using delicate camel's-hair brushes, and with a most careful eye and judgment as to the proper time. It is in this manner that the most beautiful

hybrids have been obtained, known as "garden hybrids."

Orchids are distributed over a large area of both the Eastern and Western hemispheres, and are divided into two general groups,— the East Indian and the South American. They are also classified according to their habit of growth and subsistence, as saprophytic, epiphytal and terrestrial. The first-named class includes species which grow mostly in wet and marshy places, and are of little value except for botanical purposes. The epiphytal group is by far the most valuable and most important of them all in every respect. The species of this section are often erroneously called "parasites," when it is a fact that not one of the whole orchid family is really a parasite. Nearly all the members of this class grow and thrive best upon the trunks and limbs of trees in mid air, simply clinging to a single stem or small limb, and, therefore, sometimes quite properly called air-plants. It is this group, too, which contains the most beautiful and most valuable species and varieties and the most varied colors. Their natural habitats are generally confined to tropical and subtropical climates in both hemispheres, where the moisture-laden and humid atmosphere affords the most congenial nourishment to these wonderful plants. Several epiphytal orchids are found in the extreme southern parts of the United States, some of which are highly interesting and fairly valuable.

The terrestrial orchids are such as grow upon the ground and, therefore, have no need of the pseudo-bulbs or hypertrophied stems, which are peculiarly characteristic of the epiphytal section.

Of the other two classes, saprophytes and terrestrial, many varieties are indigenous throughout the United States and even as far north as Canada. These are what are known as the hardy native varieties, which have their resting season during the winter months, while all the epiphytal (sometimes called celestial) orchids, which are found only in tropical climates, have their periods of rest during the dry season. Therefore the cultivator of these plants under glass must imitate nature as near as possible, giving them their season of rest after their new growth is finished, when water should be withheld gradually and only enough moisture applied to keep them alive until nature itself shows signs of fresh activity. This is the time the plants start in to develop and bring forth their flowers upon and from their previously matured and ripened growths or pseudo-bulbs, when moisture is again applied gradually, increasing the supply from day to day; and it is at this period that keen judgment must be exercised.

During the past 10 or 15 years orchids have become one of the most fashionable classes of plants—in fact no other flower has ranked so high in favor or is appreciated more to-day by the better and more highly cultured and æsthetic class of people both in Europe and America than is the orchid. From a commercial standpoint no flowers command the prices for floral decorations, both as plants in bloom and as cut flowers, equal to those of the many beautiful varieties of orchids which are now cultivated. Millions of dollars' worth of these plants are now in cultivation, both in commercial

as well as in private collections, although 25 years ago very few practical gardeners knew much about their cultivation; previous to 1880 it was a rare treat to see even a few of the very ordinary varieties in bloom, and then usually they were only found in private conservatories; scarcely any commercial collections existed. Every year the demand is increasing, and thousands of dollars' worth of these rare plants are imported annually from South American countries, the East Indies, the Philippines and even from Australia. To keep up the supply many practical and experienced collectors are sent out to these distant tropical countries to gather the plants, and the time is fast approaching when it will be almost impossible to collect any more plants within reasonable reach. In fact, so great has been the traffic that several South American governments have put an export duty upon the plants, while others have prohibited their further collection and exportation, entirely from fear of their total extinction.

This state of affairs has brought about the raising and cultivating of thousands of seedling orchids since 1895, and with it the crossing of desirable species and varieties in order to obtain a better and improved class of plants and more beautiful types of flowers. But this is a very slow process, and great patience and many years of time and labor are required to bring them to flowering maturity and size. Carnations and other flowers can be raised in a single year, and even roses in two or three years, but it requires from five, 10 or 15 years to raise orchid plants fit for blooming purposes, so that we may never expect to see orchids in overabundance.

Treatment and Culture.—It is by no means as difficult a task to grow and cultivate these interesting plants as was supposed when orchids were first introduced to the public in this country during the year 1887, when a prominent florist, who practically is the pioneer in orchid culture, gave the first exhibition of these plants in midwinter in the city of New York. This was followed by annual exhibitions for several years, and people became interested in these wonderful plants. It was then thought next to impossible for anyone except an experienced gardener to manage them, and also that it would require specially constructed greenhouses; but many fine flowers have been produced by laymen in ordinary greenhouses—even in light and sunny windows many varieties thrive so well that thousands of people are cultivating orchids there. They, like other tropical and semi-tropical plants, require plain but careful treatment. They can be grown in ordinary flower-pots in a compost of a certain fibrous peat. The lower half of the pot is to be filled with potsherds and pieces of charcoal intermixed; then place the roots and rhizome of the plant in the peat, and fasten and pack it well. These plants can also be grown in earthen pans or wooden cribs, so that the plants may be thus suspended from the ceiling or in the windows. They require a continuous temperature of from 55 to 70° F., not lowered during the night. Water should be applied sparingly at first, when the plants start into growth, and gradually increased as the plants require it. Frequent spraying or syringing, especially dur-

ing the spring and summer season, is highly beneficial. This should be done, however, in early morning or after three o'clock in the afternoon. In the winter or during their time of rest, when the recently made new growth is maturing, water must be given with judgment and only enough to keep them from shriveling.

Nearly all orchids delight in sunlight, but of course are not to be exposed to direct burning hot sunshine. A judicious shading is beneficial to their welfare. If such treatment is observed the plants, if healthy and thrifty to start with, will grow and flower as successfully as any other plants.

Following is a list of the most popular varieties of orchids named in the order of their commercial importance, with the countries from which they are obtained.

Cattleya.—The orchids of this genus undoubtedly rank as the most popular and most valuable among all orchids. They also contain more species and varieties than any other, and are confined entirely to South America, where they are known by their common name of "fleur de mayo," because the majority of these varieties produce their gorgeous flowers in the month of May, generally the beginning of the wet season. Following are the principal named varieties:

C. mossiae, *C. speciosissima*, *C. percevilliana*, and *C. lawrenciana*, all of Venezuela; *C. labiata*, *C. warnerii*, *C. schroederii*, *C. harrissonii*, *C. intermedia*, *C. gaskelliana* and *C. leopoldii*, each Brazilian, and several other kindred varieties; also *C. trianae* (and many varieties), *C. mendeli*, *C. gigas* and varieties, all of the Andes or New Grenada; *C. maxima*, of Peru; *C. dowiana*, one of the most valuable and richly colored species, of Costa Rica; *C. citrina*, of Mexico; *C. skinnerii*, of Guatemala and Costa Rica; and *C. bowringiana*, of Honduras.

Lælia.—This genus is closely allied to *Cattleya*, and includes the following species: *L. purpurata*, often called "queen of orchids," a native of Brazil; *L. elegans*, and its varieties; *L. harpophylla* and others, also of Brazil; *L. anceps* and its many varieties; *L. autumnalis*, *L. gouldiana*, *L. alba*, *L. albida*, *L. majollis*, *L. digbiana*, all of Mexico.

Oncidium.—This genus embraces many beautiful and valuable species and varieties, among which the following are most prominent: *O. varicosum* and *rogersii*, the golden butterfly orchid; *O. kramerii*, mottled butterfly; *O. sarcodes*, *O. macranthum*, *O. marshallianum* and many others, all of Brazil; *O. papilio*, the "butterfly" of the West Indies and South America; *O. splendidum* and *O. cavendishianum* of Mexico and Guatemala; *O. tigrinum* of Mexico, and many others.

Odontoglossum.—This genus includes some of the most beautiful and grandest orchids in existence, and the only difficulty is that up to the present time their successful cultivation under glass is still unsolved in this country, although they are very successfully grown in some sections of Europe, where they command a higher value than almost any other orchid. The most important varieties of this species are: *O. crispum*, *O. pescatorei*, *O. albobpurpurea*, *O. harryanum*, and kindred varieties, all of New Grenada or Colombia; *O. grande*, the "baby" orchid of Guatemala and Mexico; *O. citrosimum*,

ORCHIDS

2 Odontoglossum

1 Lady's Slipper

of Guatemala, and *O. inselexii leopardinum*, of Guatemala and the Pacific slope of Mexico.

Peristeria.—Flower of the Holy Ghost (*Peristeria elata*), of Central America.

Lycaste.—Several species of Guatemala and Mexico.

Catasetum.—These are South American and more interesting than beautiful, except *C. bungeothii*, which is ivory white and very fragrant.

Stanhopea.—A genus including one of the most curious of orchids, throwing its sweet-scented large flowers from the rhizome downward through its receptacle. Some six or seven varieties exist, natives of South and Central America.

Chysis.—Four or five species are found in Guatemala and Mexico. Very curious plants and flowers, one of which is the "laughing orchid."

Schomburgkia.—A genus of very large and curious plants with inconspicuous great flowers. *Schomburgkia crispum* and *S. undulatum* are well-known species of South America and the West Indies.

Masdevallia.—A very curious genus with numerous varieties, bearing highly interesting flowers.

Epidendrum.—A very large genus with many valuable and showy varieties, nearly all of which are highly epiphytal in character. Many of this group are not very desirable.

Of East Indian orchids, first in importance is the genus *Dendrobium*, a very large and valuable group, which includes a large number of species and varieties, all of which are found in the East Indies, Moulman, Assam and Burma, except two, found in Australia. The principal species are as follows: *D. nobilis* and its many sub-varieties; *D. wardianum*, *D. crassinoide*, *D. chrysotoxum*, *D. thyrsiflorum*, *D. densiflorum*, *D. devonianum*, *D. falconeri*, *D. farmerii*, *D. chrysanthum*, *D. dalhousieanum*, *D. formosum*, and many others of less importance, except *D. bigibbum* and *D. phalaenopsis* of Australia.

Phalaenopsis.—A genus of East Indian species called moth-orchids. This is one of the very rarest and most valuable genera and also the most difficult group to cultivate successfully, but their beautiful and really fantastic miniature bird-like flowers render them very desirable. Most of them are natives of and found in the Philippine Archipelago, and in Burma and Siam. Following are the most valuable varieties: *P. amabilis*, *P. grandiflora*, *P. schillerianum*, *P. sanderianum*, *P. luddemaniana*, *P. casta*, *P. stuartianum*, *P. violacea*.

Vanda.—This genus represents the tribe or order of *Vandaceae*, which includes the *Aerides*, *Saccolabium* and *Angraecum*. Prominent species are *Vanda cœrulea*, *V. tricolor* and its varieties; *V. insignis*, *V. lowii*, *V. batemanii*, *V. cathcartii*, *V. sanderiana*, *V. teras*, *V. kimbali*, *V. amesian*; *Aerides odorata*, *A. fieldingii*, *A. lobbii*, *A. virens* and many others; *Angraecum sesquipedale*, *A. eburneum-virens*; *A. articulatum*, *A. ellisii* and *A. leonii*; *Saccolabium giganteum*, *S. blumei*, *S. guttatum*, *S. ampulaceum* and others. Other semi-terrestrial forms are *Calanthe veitchii*, *C. vestita* (varieties *occulata* and *rubra*), *A. turnerii*, *A. regmerii*, *A. gigantea* and a few other hybrids; *Cymbidium lowianum*, *C. eburneum*, *C. gigan-*

tum, and *C. mastersii*; *Cælogyne cristata*, *C. alba* (rare), *C. lemoniana*, *C. flaccida*, *C. dayiana* and *C. pandurata*; *Phajus grandiflora*, *P. tuberculosa*, *P. wallichii*, *P. maculatus* and *P. humboldtii*.

Cypripedium.—This genus, embracing the ladies' slipper, or slipper orchids, is the most important group of terrestrial orchids, and includes a vast number of species from which have been raised a greater number of rare hybrid varieties than from any other class. While not as showy as many of other genera they are highly interesting to the hybridist, and from this standpoint are very valuable. Sometimes a single small plant of a new hybrid will sell for \$500.

ORCHIL. See ARCHIL.

ORCHIS, the typical genus of the order *Orchidaceæ*. The roots of several species, as those of the *O. mascula* and *O. morio*, when dried, form the European or indigenous salep. That prepared from the first-named species is said to be the best. Salep (q.v.) contains the principle called bassorin and a little starch, possessing similar properties to those of starchy and mucilaginous substances generally.

ORCHOMENUS, ór-kom'-ē-nūs, Greece, (1) an ancient Bœotian city, capital of the kingdom of the Minyæ, situated at the north-western corner of Lake Copais (now Topolia) where it is joined by the Cephissus. The town extended from the marshy edges of the lake up the face of a steep rock hill, on which stood the acropolis. It sent 30 ships to the Trojan War, and at a later date became a member of the Bœotian confederacy. Its government was thoroughly aristocratic, and after the Peloponnesian War the jealous democratic Thebans destroyed it by fire, and sold its inhabitants as slaves 368 B.C. It was rebuilt in the reign of Philip of Macedon, but was again destroyed in 346, and never recovered its position. It was famous for its musical festival in honor of the Graces, who were specially worshipped in the city. In 1880-86 Schliemann excavated there a royal tomb or mausoleum, larger than the "Treasury of Atreus" at Mycenæ (q.v.). (2) A former city in Arcadia north of Tripolitza, on

a hill dominating the road to the north. During the wars of the Macedonians and Achæans it was a fortified post of considerable strategic value. Consult Leake, 'Travels in Northern Greece' (London 1835); Müller, K. O., 'Ochrogenos und die Minyer' (Breslau 1844); Schliemann, 'Ochrogenos' (Leipzig 1881).

ORCIN, ôr'sin, in chemistry, also called orcinol, $C_7H_5O_2$. It exists ready formed in some of the lichens which produce colorless matters themselves, but which yield coloring substances by reaction with water, ammonia or air. Orcin is also prepared artificially from orsellic acid by boiling in water, $C_8H_5O_4 = C_7H_5O_2$ (orcin) + CO_2 . On evaporation the orcin crystallizes in the form of colorless, six-sided, monoclinic prisms, which are soluble in water, alcohol and ether, and have a nauseous sweet taste, but no odor. In the hydrated state it melts at $57^\circ C$. and in the anhydrous state at $108^\circ C$. It is a di-hydroxy-toluene represented by the formula $C_6H_3(OH)_2$. It yields rhombic crystals and forms substitution products with bromine, chlorine and iodine. Orcin gradually turns red on exposure to the air.

ORCUS, ôr'kûs, the Latin name for Pluto, hades or the infernal regions. See PLUTO.

ORCUTT, William Dana, American author and typographic expert: b. West Lebanon, N. H., 18 April 1870. He is associated with the Plimpton Press, Norwood, Mass., and his published writings are 'Good Old Dorchester,' a narrative history (1893); 'Princess Kellisto,' fairy stories (1903); 'Robert Cavalier,' a novel (1904); 'The Flower of Destiny,' a novel (1905); 'The Spell,' a novel (1909); 'The Lever,' a novel (1910); 'The Moth,' a novel (1912); 'The Writer's Desk-Book' (1912); 'The Madonna of Sacrifice,' a Florentine story (1913); 'The Author's Desk-Book' (1914); 'The Bachelors,' a novel (1915).

ORCZY, ôr'chî, Baroness (MRS. MONTAGU BARSTOW), English novelist and dramatist: b. Tarnaörs, Hungary, 19th century. She was the eldest child of Baron Felix Orczy and studied painting at the Heatherly School of Art, London. She made several exhibits at the Royal Academy and in 1900 turned her attention to writing. She became a British subject through her marriage. She contributed a series of detective stories known as the 'Old Man in the Corner' series to the *Royal Magazine* and these were produced as a drama at the New Theatre, London, in 1905. Her other plays include 'The Scarlet Pimpernel,' co-author with her husband; 'The Sin of William Jackson'; 'Beau Brocade'; among her novels are 'The Scarlet Pimpernel' (1905); 'I Will Repay' (1906); 'The Tangled Skein' (1907); 'A True Woman' (1911); 'Eldorado' (1913); 'A Bride of the Plains' (1915); 'Leather Face' (1916); 'Lord Tony's Wife' (1917), etc.

ORD, ôrd, Edward Otho Cresap, American soldier: b. Cumberland, Md., 18 Oct. 1818; d. Havana, Cuba, 22 July 1883. He was graduated from West Point in 1839 and served in Florida and in California until the outbreak of the Civil War when he was promoted brigadier-general of volunteers and assigned to a command in the Army of the Potomac. In 1862 he was made major-general and transferred to

a command under General Halleck and distinguished himself under Grant at Corinth. He was present at the capture of Vicksburg and in 1865 was appointed to the command of the Army of the James and the Department of Virginia with which he was present at the capture of Richmond. Subsequently he was given charge of the Department of the Ohio and in 1866 he was mustered out of the volunteer service. He remained in the regular army in command of the Departments of Arkansas, California, Platte, and Texas successively and in 1881 was retired with the rank of major-general.

ORDEAL, certain acts which a person suspected of crime was made to perform solemnly and which would in the ordinary course of things be hurtful or fatal to him; if, however, he performed them without being injured, he was declared to be innocent. These tests were called ordeals or judgments of God. As the results of them often depended on those who made the preparations, there was abundant opportunity for deceit and malice.

The following ordeals were anciently in vogue throughout Europe: The duel or wager of battle (see COMBAT), in which the conquered was held guilty; the ordeal of fire; of water; the corsned; the trial of the eucharist; the test of the cross; and the judgment of the bier. In the ordeal of fire the accused walked barefooted over coals of fire, or over red-hot plowshares; or had to carry a red-hot iron in his hand; or was made to walk through fire; in the last case he was dressed in cloth covered with wax (the trial of the waxen shirt); if he was unhurt by the fire and the wax unmelted, he was considered innocent. In the trial by cold water (often applied to witches) the test would be whether the accused sank or floated; if the latter, he (or she) was guilty; or the suspected party had to put his hand into boiling water and lift something out. In the corsned trial a priest put the corsned, or halloved bread, into the mouth of the accused, with various imprecations. If the accused swallowed it he was freed from punishment. The test of the eucharist was applied chiefly among the clergy and monks. When they took the host it was believed that God would smite the guilty with sickness or death. In the trial of the cross, the accuser and the accused were placed under the cross with their arms extended or cross-wise and who first moved his hands or suffered them to fall was held to be guilty. Or the accused was placed before relics and two dice were then produced, one marked with a cross. Of these one was taken up at hazard. If it happened to bear the sign of the cross the accused was acquitted. Finally the judgment of the bier was used in the trial of murder; the murdered person was placed upon a bier and the accused made to touch the body. If blood flowed out, or foam appeared at the mouth, or the dead body changed its position, the suspected person was considered guilty. Superstition and artifice gave to these ceremonies the highest authority; and even the emperors were unable to abolish them. The papal chair restrained them by improving the judicial system; after the 14th century ordeals became uncommon and in the 15th they were superseded by the canon law, which invented the oath of purgation, by which the accused was acquitted

on a solemn declaration of his innocence. The universal use of the Roman law also tended to abolish trial by ordeal. In the 16th century only the trial of the bier survived, and this continued even to the 18th. Besides this ordeal of cold water for sorcery (found in Prussia in the 17th century and in the neighboring countries in the first half of the 18th), witches were weighed, and if found to be light they were pronounced guilty. These foolish customs were gradually done away, when Thomasius (See THOMASIVS, CHRISTIAN), succeeding in almost wholly annihilating the belief in witches. Yet as late as 1728 witches were weighed at Szegedin in Hungary. Roman law substituted in their place an equally cruel process, namely, the torture. Ordeals are still found among all the negro nations north of the Zambesi. When a man suspects that any of his wives have bewitched him, he sends for the witch doctor who makes an infusion of the plant called *goko*. His wives all drink it, each one holding up her hand to heaven, in attestation of her innocence. Those who vomit it are considered innocent, while those whom it purges are pronounced guilty and burned to death.

Some negroes on the coast of Guiana put into the hands of the accused herbs and barks of a peculiar character and suppose they have the property of burning the guilty. Ordeals of various kinds, but chiefly the trials by fire and by water, are found among the Chinese, the natives of Pegu, of Kongo, of the coast of Guinea and the tribes of Asiatic Russia. In Senegambia an application of red-hot iron is made to the tongue of the supposed criminal. In Siam the accuser and the accused were placed together in one spot and a tiger was let loose upon them. If one was spared, he was considered innocent; if both were destroyed, they were both deemed guilty; and if both were spared, they were compelled to undergo some more certain test. In eastern Africa, among the Wanaka tribe, are the ordeals of the hatchet, of the copper kettle, of the needle and of the piece of bread. The first two were analogous to the hot iron ordeal and the last to the corsned of Europe. In the ordeal of the needle, a red-hot needle was drawn through the lips of the alleged criminal and if blood flowed from the wound, he was deemed guilty; but if none, innocent. In Madagascar the trial by ordeal is still generally practised by legal authority. The supposed criminal is made to drink a decoction of a poisonous fruit called the *tangena*, a small dose of which acts as an emetic, while a large dose is fatal. By managing the size of the dose, those who administer it can decide the result. Consult Brunner, Heinrich, 'Deutsche Rechtsgeschichte' (Vol. I, Leipzig 1906); Lea, H. C., 'Superstition and Force' (Philadelphia 1892); 'Federico Patteta,' 'Le Ordalie' (Turin 1890); Schröder, Richard, 'Lehrbuch der deutschen Rechtsgeschichte' (Leipzig 1902); Thayer, J. B., 'Preliminary Treatise on Evidence' (Boston 1896.)

ORDEAL OF RICHARD FEVEREL. The (originally published in 1859) has its place in English literature not merely because it is a great novel, but because in writing it George Meredith charged the form of the novel with a higher spiritual and poetic intensity than had before seemed proper to it. In the hands of its greatest English masters, such as Fielding,

Scott, Dickens and Thackeray, it was essentially prose in quality. George Eliot, indeed, had made it the vehicle of thought and in the hands of Dickens and Reade it had been made the vehicle of a "purpose." But Meredith, alone among novelists at the time of the publication of 'Richard Feverel,' while retaining the traditional English form of the novel, its "humors," its broad and leisurely presentation of character, its manner of narration, lifted it into a sphere of imaginative and spiritual intensity, which had hitherto been reserved for the poetic drama. The prose in which 'Richard Feverel' is written is essentially different in quality from any prose previously employed on the novel; for, while it has all the virtues of prose as usually understood, equal to all the customary conditions of the novelist's art, it has a power of kindling and flowering, in dealing with the higher moments and issues of the story, into an impassioned beauty, a spiritual fervor, for parallels to which we must go to the great poets. There are many poignant love-scenes in English fiction, but no other lifts us into the pure ether, "enskied and sainted," of boy-and-girl first love as we are lifted in those rapt and radiant chapters in which Richard and Lucy meet by the river. And this poetic intensity gains in reality by the vitalizing presence everywhere in the book of an intellectual force equally unusual in a novel. A great poet and a great philosopher had, for the first time in literary history, chosen to express themselves in the form of the novel. The philosophic side in 'Richard Feverel' finds concrete, so to say "portable," expression in the constant lightning-play of the epigram. Sir Austin Feverel—Richard's father—keeps a private epigrammatic diary called "the Pilgrim's Ship"—and this device, in varying forms, Meredith employs to flash side-lights of interpretation on his characters and the progress of his story in all his novels. Among these epigrams, which are more highly charged with poetry and "spirituality" than the word epigram usually implies, two at least have passed into the language: "I expect that Woman will be the last thing civilized by Man"; and "Who rises from prayer a better man, his prayer is answered." 'Richard Feverel' is the one book in which all Meredith's powers meet in a fusion nearest harmony. The faults of his style are as yet only indicated and the cryptic euphuism, the harlequinade of verbiage, into which it was soon to degenerate do not cloud or deface it. 'The Ordeal of Richard Feverel' and one or two of his poems, such as 'Love in the Valley,' will probably be all that the future will care to, or be able to, read of George Meredith.

RICHARD LE GALLIENNE.

ORDER, in botany and zoology, a division in classification greater than a family and less than a class. It is based upon broad criteria of structure. The distinctive suffix for names of orders in botany is *-ales*, as in *Rosales*, the order containing the rose. No such suffix is used in zoology. The principal orders in the animal kingdom are enumerated in the Table of Classification in the article ANATOMY, COMPARATIVE.

ORDER OF BUCKS. See ODD FELLOW.

ORDER OF ODD FELLOWS. See ODD FELLOW.

ORDER OF PREACHERS. See DOMINICANS.

ORDER OF SAINT JOHN OF GOD. See ORDERS, RELIGIOUS.

ORDER OF SAINT JOSEPH. See ORDERS, RELIGIOUS.

ORDER OF THE SNARES OF LOVE. See ORDERS, ROYAL.

ORDER OF SOLOMON'S SEALS. See ORDERS, ROYAL, *Abyssinia*.

ORDER OF UNITED AMERICAN MECHANICS. See UNITED AMERICAN MECHANICS, ORDER OF.

ORDERS, Holy. See HOLY ORDERS.

ORDERS, Religious. The primary conception upon which the theory of the monastic life is based is an extremely old one, the belief that it was possible for man to perfect his moral nature and to attain the highest degree of spirituality by resorting to austere discipline and bodily mortification having been common among both Jews and Pagans long before the beginning of the Christian era. In fact, one has but to turn to the Essenes, the Stoics or the Therapeutæ to find the germ of thought that was not only to inspire the asceticism of the early Christian times, but that was to grow and expand into the more purposeful religious orders of our own day; for the ascetics, with their maceration of the flesh, and the anchorites, or hermits, who retired from the world to strive to find spiritual strength in desert places, were the forceful influences in religious life, the examples of spiritual contemplation, without which the great monastic orders could scarcely have been instituted. The first ascetics as a rule did not separate themselves from the world, but sought to find the spiritual perfection to which they aspired by means of prayer and mortification of the flesh, not by withdrawing from the company of men; and even when, in the 3d century, the more zealous Christians were driven by persecution to find a place of refuge in the desert, they lived apart, in separate cells, such an idea as that of a common life or community of interests being entirely foreign to their purpose. It was Saint Anthony who first gathered a class of disciples about his feet that he might teach them, from his own wisdom and experience, how best to attain the spiritual heights upon which their longing eyes were set, and yet Saint Anthony formulated no hide-bound rule of life and announced no principles that would lead one to imagine that he had thought of uniting his individual disciples into a formal congregation. Saint Pachomius, who about 315 A.D. built his first monastery in the Thebaid, had only a vague idea of the value of the community life, and not the least conception of the possibilities for which he was so firmly laying the foundation, the religious orders of the Middle Ages that were at last to become such a powerful influence in the evangelistic work of the world. Although the rule of Saint Benedict was practically the only one that had been adopted at the beginning of the 10th century, the monasteries up to that time had been under the control of bishops. In the 10th century, however, several separate communities formed themselves into congregations under the direction of a common superior, and it was then only that the word

"order" could be properly applied to any of the monastic institutions. This rule of Saint Benedict, which remained the popular monastic rule for centuries, provided a year's probation for novices, and bound each member after that period to constant residence within the monastery, unconditional surrender to the superior, canonical prayer, regular labor and lives of chastity and complete renunciation of the pleasures of the world. The rule of Saint Augustine, another formula for the religious life which was quite widely adopted during the early centuries, was at first intended exclusively for the clergy and was not adapted for the use of the monks, who were then reckoned among the laity. It was not until the 8th century, therefore, when monks came to be regarded as entitled to clerical rank, that it was assumed by other than the regular clergy. The desire to give more austerity to the religious life, a movement which began to be noticeable in the 11th century, resulted in the establishment of several new orders. In almost each instance, while the rule of Saint Benedict was adopted, it was made more strict by special statutes, and to those who aspired to great asceticism life in these congregations appealed strongly. On the other hand, institutions like that of the Trinitarians, the Order of Grace and others that mingled more freely with the world, were adopted by those who felt drawn to lives of action rather than to silent contemplation. To the mendicant orders, which appeared at about this time, many special immunities and privileges were given, and these were exercised everywhere without regard to parochial rights or jurisdictions.

From the beginning of the 10th century the multiplication of these religious associations of men bound together by vows to live devotional lives separated from the world has been almost continuous. Local prescriptions, like the Reformation in England, Germany and other parts of Europe, the Revolution and the later "Law of Associations" in France, the attacks of the Liberals in Spain and other forms of suppression have, from time to time, driven certain orders into extinction, but reorganization and rejuvenation, as well as the institution of new orders upon more modern rules of life, have tended to obliterate nearly all traces of the damage done by the passage and enforcement of such unfriendly statutes. The most numerous bodies of monks, of course, are those of the Roman Catholic Church. In the Eastern Church nearly all the orders follow the rule of Saint Basil, while the monastic orders in the Church of England or the Protestant Episcopal Church in the United States have either adapted old rules of living to their own use or have formulated rules suitable to themselves. In the Roman Catholic Church, however, monastic orders of men or women have been founded for almost every purpose. See also article THIRD ORDERS.

The following is a list of male orders and congregations that have attained any great degree of prominence in the religious world and that have houses in the United States:

ORDERS OF MEN.

AFRICAN MISSIONS, SOCIETY OF THE.—The Society of the African Missions was established in Lyons, France, where the mother house is located. In the United States, the fathers of this society are in charge of the Catholic negroes in the diocese of Savannah, Ga.

ALEXIAN BROTHERS.—A pious society founded in the beginning of the 14th century by one who is simply known as "Tobias." The end of the order is two-fold: The sanctification of the Brothers, and the active exercise of charity toward the neighbor. See **CELLITES**.

ATONEMENT, SOCIETY OF THE.—The Society of the Atonement was established, 3 Oct. 1899, by the Rev. Father Paul, as a religious congregation of the Protestant Episcopal Church. Ten years later, 30 Oct. 1909, the congregation of friars, as well as the sisters and the Society's third order, were received into the Roman Catholic Church. The Society observes the rule of Saint Francis and has for its purposes: "(1) the reconciliation of Anglicans and other non-Catholics to the Apostolic See; (2) the reconciliation of sinners to God through the ministry of penance and the preaching of the Atonement; (3) sending missionaries to the heathen." Located near Garrison, N. Y.

AUGUSTINIANS.—An order founded in Africa, in the 4th century, by Saint Augustine. It is devoted chiefly to intellectual and missionary works in America and Asia. In 1256 the various brotherhoods were united by Pope Alexander IV. See **AUGUSTINIANS**.

BARNABITES, OR REGULAR CLERKS OF THE CONGREGATION OF SAINT PAUL.—An order founded in 1533, by Saint Antonio Maria Zaccaria, for the purpose of combating the evil tendencies of the age by the organization of a congregation of secular clergy who should not retire from the world, but who should live in it and work for it, and diligently attend to their own sanctification while preaching reformation to others. Besides the usual three vows, its members took a fourth: Never to seek office or ecclesiastical dignity, nor to accept any post outside of their order, without the permission of the Pope. With headquarters at Rome it has colleges in various parts of Europe.

BASILIANS.—An order taking its name from Saint Basil, bishop of Cæsarea in Cappadocia. See **BASILIAN MONKS**.

BENEDICTINES.—An order established at Subiaco, in the 6th century, by Saint Benedict, the patriarch of monks in the West. See **BENEDICTINES**.

BERNARDINES, OR WHITE MONKS.—A particularly strict order of Cistercians instituted by Saint Bernard of Clairvaux, about 1115.

BLACK FRIARS. See **DOMINICANS**.

BLESSED SACRAMENT, CONGREGATION OF THE.—Founded by Pierre Julien Eymard, in 1856, as an effort to accentuate the honor paid to the Holy Eucharist, by the perpetual exposition and adoration of the Sacrament. The order has extended to all parts of the world.

BRIGITTINES, OR THE ORDER OF THE SAVIOUR.—Founded by Saint Bridget, about 1344, upon a constitution said to have been communicated by divine revelation. Its rule was that of Saint Austin. It is still represented throughout the European countries.

CAPUCHINS.—The shape of a cowl was the bone of contention that at one time threatened the stability of the Franciscan order and that finally resulted in the institution of the order of Capuchins. The reformer was Matteo di Bassi of Urbino, an Observantine friar, who, becoming convinced that the cowl worn by the friars of that day was not the cowl prescribed by Saint Francis, not only adopted a *capuche* of different shape, but, in 1526, obtained permission of Pope Clement VII for himself and his companions to wear this habit and also to adopt the life of hermits, preaching the gospel in all lands, under the provision that they should present themselves annually at a general chapter of the Observantines. Matteo began his preaching, and was so successful in arousing public interest that the provincial of his order had him arrested for apostasy. He was released from prison through the intervention of relatives of the Pope, and, shortly afterward (1528), a bull was obtained which authorized the union between the reformers and the Conventual branch of the Franciscans, allowed them to adopt the hermit life, sanctioned the wearing of beards and permitted the use of the long-pointed cowl. From that day the growth of the order was rapid. Although still subject to the Conventuals, and under the rule of a vicar-general, the order in 1859 adopted separate statutes in which all the hours for religious service, for mental prayer, for silence, for taking the discipline, etc., were clearly prescribed. It was also stipulated that the order should have no revenues, but should live by begging, and everything about its churches and convents should be as poor and mean as possible. As to food, the friars were permitted to eat one kind of meat a day and wine was not forbidden, but it was specified that nothing should be said to discourage any member who might desire to diet himself more rigorously. Under this rule the order has produced many men eminent for their eloquence, their learning or their Christian virtue, one of the most illustrious being Saint Fidelis of Sigmaringen, who was martyred in 1622. Strangely enough, however, the founder Matteo resigned from the order because the Pope had decreed that Capuchins who did not remain in their monasteries should not be permitted to wear the long cowl. In 1617 the Capuchins were made exempt from obedience to the Conventuals, and, under its present title, the order withstood the Revolution and other similar movements, and is widely represented to-day.

CARMELITES.—Founded in the middle of the 12th century by a Crusader named Berthold who vowed to embrace the religious life if God would make his side victorious in battle. See **CARMELITES**.

CARTHUSIANS.—The order of Carthusians was founded in the 11th century by Saint Bruno of Cologne, who resigned his position as scholasticus of the episcopal school of Rheims in order that he might retire from the world. The foundation of the new order was erected at Chartreuse, an upland valley, in the Alps, more than 4,000 feet above the sea. Although almost unapproachable, being surrounded on all sides by high crags, and while the soil was poor, the temperature low and the air charged with fog at almost all times, the site was gladly accepted, and here Bruno and his companions built their mother house, after the form adopted by the ancient Lauras of Palestine. In 1089 Bruno was summoned to Rome by Pope Urban II, who had been one of his pupils, and he never returned to Chartreuse, spending the remainder of his life in founding convents and promoting the interests of his order. Although it was many years before any statutes were framed for the Carthusians, and while the complete code was not arranged and approved by the Holy See until the latter part of the 17th century, the writings of Peter the Venerable, abbot of Cluny, prove that their life was one of great austerity even without a written rule. "Their dress," he says, "is meaner and poorer than that of other monks; so short and scanty and so rough, that the very sight affrights one. They wear coarse hair shirts next their skin and fast almost perpetually. Their constant occupation is praying, reading, and manual labor, which consists chiefly in transcribing books. In spite of this rule, a rule so strict that the Church permits members of other mendicant orders to exchange their vows for those of the Carthusians while the Carthusian can pass to no other order, the success of its members in their search for the perfect life has been marked by great success." Since 1508, in accordance with the decree of Pope Julius II, the Carthusian monasteries in every part of the world have been under obedience to the prior of the Grand Chartreuse and the chapter-general of the order.

CHARITY, BROTHERS OF.—The congregation of the Brothers of Charity, of Saint Vincent de Paul, was founded in Belgium, about 1809, by Rev. I. Triest, canon of Saint Bavon, Ghent. Founded for the purpose of procuring the sanctification of its members by the practice of the three simple vows and the observation of its constitution, its special object is the ministry of charity. 'His ministry, which the Congregation exercises in its several establishments, consists chiefly in maintaining and ministering to the aged, the sick and the insane; in sheltering poor workmen; in educating children of all classes, but principally the poor, the orphan, juvenile offenders and the deaf, dumb and blind, and by performing any other work of charity to which they may be called.

CHARITY, FATHERS OF THE INSTITUTE OF. See **ROSMINIANS**.

CHARTREUX. See **CARTHUSIANS**.

CHRISTIAN BROTHERS. See **BROTHERS OF THE CHRISTIAN SCHOOLS**.

CHRISTIAN BROTHERS, IRISH.—A religious congregation founded at Waterford, Ireland, in 1802, by Edmond Ignatius Rice, for the purpose of improving the education of the poor who were unable, under the penal laws, to procure Catholic education. The rules and system adopted were those of the institute founded by De la Salle, and the first school was opened at Mount Sion, in Waterford, 1 May 1804. The success of this venture was so great that similar establishments were opened in Dublin, Limerick and other cities, and the results were so satisfactory that on 5 Sept. 1820, Pope Pius VII, acting upon the memorial of the bishops of Ireland, confirmed the institute and granted it a constitution. At the time of the establishment of the system of national education, in 1831, the Brothers placed their schools under the direction of the board, but when it was found that its rules regarding the absolute separation of secular and religious teaching were tending to lead them from the spirit under which they had been founded, they withdrew their connection with the government and have since conducted their schools as an independent institute under the protection of the Church. The Brothers are bound by the usual religious vows and are under the direction of a superior-general.

CHRISTIAN DOCTRINE, FATHERS OF THE CONGREGATION OF.—The congregation of the Christian Doctrine is the outgrowth of a society which was founded by Marco Cusani for the purpose of adopting more systematic methods in the teaching of the doctrines of the Church. When organized in 1560, the membership was composed of a number of priests and laymen who confined their efforts to teaching the catechism to children on Sundays and to the ignorant peasantry on Church holidays and such other times as it was possible to reach them, but the influence of the association was so strongly for good that it attracted the attention and approbation of Saint Pius V. Both Clement VIII, in 1596, and Urban VIII, in 1627, made the confraternity the object of their favor, the latter issuing an order providing that members leaving the community should incur the penalty of apostasy, as if monks. Pope Paul V made the society an archconfraternity.

ternity, and as such it remained until modern times, when it assumed the title of Congregation.

CHRISTIAN INSTRUCTION, BROTHERS OF THE.—This institute, which has for its purpose the Christian education and instruction of youth, was founded at Saint Brice, France, by Abbé John Mary de la Mennais. In 1891 it was approved by the Holy See.

CHRISTIAN SCHOOLS, BROTHERS OF THE.—An educational institute founded by Abbé J. B. de la Salle in the 17th century. See **BROTHERS OF THE CHRISTIAN SCHOOLS.**

CISTERCIANS.—The order of Cîteaux, founded in 1098 by Saint Robert as an offshoot from the Benedictines, eventually became one of the most flourishing and illustrious of all the orders of the Church, but is now so nearly extinct that but few traces remain, the storms of the Reformation and Revolution leaving few of its convents in Europe. The order was founded in 1098 in the desert at Cîteaux, near Dijon, by Saint Robert, who had gathered some 20 zealous hermits about him. Together they entered upon a most austere rule of life, for never was the rule of Saint Benedict followed more rigorously. There was fasting from 14 September until Easter, little sleep and much hard labor, with prayer and religious contemplation as the only relaxation. This was Saint Robert's ideal of the religious life, but he was not permitted to follow it for long, being commanded by the Pope to return to Molesme, his former charge. He obeyed the order promptly, leaving Alberic as his successor at Cîteaux, and it was he who drew up the first statutes of the order, and who changed the color of the habit from brown to white. During more modern times there have been several reforms of the order, the most celebrated being that which was instituted at La Trappe. See **TRAPPISTS.**

CONGREGATION OF JESUS AND MARY. See **EUDISTS.**

CONVENTUALS. See **FRANCISCANS.**

CORDELIERS. See **FRANCISCANS.**

CROSIER FATHERS. See **HOLY CROSS, CANONS OF THE.**

DIVINE LOVE OF JESUS, MISSIONARIES OF THE.—A missionary congregation, with mother house in Rome and a scholasticate at Saint John Kentius College, Washington, D. C.

DIVINE SAVIOUR, SOCIETY OF THE.—Originally organized at Rome (8 Dec. 1881) as the "Society of Catholic Instruction," the name of the Congregation was subsequently changed to the present title, and papal approbation was granted 27 May 1905. In addition to the three vows, members take a fourth, of apostolic mission work. In the United States, the Society has representation in the diocese of Green Bay.

DIVINE WORD, SOCIETY OF THE.—The Society of the Divine Word was founded by Rev. Arnoldus Janssen in 1875. Its object is the promotion of missionary work among the heathen and the education of youth of all races.

DOMINICANS, or ORDER OF PREACHERS.—An order founded in the 13th century by Saint Dominic. See **DOMINICANS.**

EUDISTS.—A congregation of secular priests founded by Père Eudes of Normandy, in 1601. Established under the names of Jesus and Mary, the Congregation had for its object the training of the clergy and the giving of missions. The Eudists make no vows and wear the ordinary dress of the secular clergy.

FEUILLANTS. See **CISTERCIANS.**

FRANCISCANS.—The order founded by Saint Francis of Assisi in the early part of the 13th century. See **FRANCISCANS.**

FRIARS MINOR. See **STRICT OBSERVANCE**, in this article.

GREY FRIARS. See **FRANCISCANS.**

HOLY CROSS, CANONS OF THE.—A religious order with mother house in Holland; represented in the diocese of Saint Cloud.

HOLY CROSS, CONGREGATION OF THE.—The Congregation of the Holy Cross was founded in Le Mans, France, 1793, by Rev. James F. Dujarie. Its object was the rehabilitation of the Christian schools then almost destroyed by the Revolution. At first it was composed only of Brothers, but, in 1837, candidates for the priesthood were admitted under the Rev. B. Moreau, who became the first superior-general. The Congregation received the approval of the Holy See 13 May 1857, as a religious society of priests and brothers, devoting their lives to educational work in universities, colleges and schools, and missionary work at home and in foreign countries. The Congregation was introduced into the United States in 1841 when the Rev. E. Sorin, afterward to become the head of the Society throughout the world, established a college in the primeval forest of northern Indiana and called the place Notre Dame. From this humble beginning grew the University of Notre Dame, one of the largest and most advanced Roman Catholic educational institutions in America. The original band of 11 has developed into a community of 275 priests and brothers, conducting colleges in various parts of the United States and Canada. Its members also have charge of large missions in India, and the Congregation is noted for its progressive spirit and the zealous work and scholarly attainments of its members.

HOLY CROSS OF WESTMINSTER, ORDER OF THE.—A religious order for priests and laymen of the Protestant Episcopal Church. It was founded in New York City in 1881, but was removed to Westminster, Md., in 1892. Its

objects are the cultivation of the spiritual life of its members and the performance of good works, especially those connected with missions, retreats, etc.

HOLY GHOST, CONGREGATION OF THE.—The Congregation of the Holy Ghost, otherwise known as the Missioners of the Immaculate Heart of Mary, is the result of the union, in 1848, of these two societies. The Congregation of the Holy Ghost, had been founded in Paris, in 1703, by Claude Desplaces, a Breton, while the Missioners were organized by Francis M. P. Liebermann, about 1841. Finding that the two organizations were working along practically similar lines, it was decided to effect a fusion, the rule of the Fathers of the Holy Ghost, which had already been confirmed at Rome, being retained, while the constitution adopted should be that of the Missioners. Its objects remained the same: The perfection of its members and the evangelization of the blacks, especially the negroes of Africa. Since 1848 many educational institutions have been founded, and all have been conducted with skill and ability, the most important being the French Seminary at Rome. The Society is governed by a superior-general elected for life, while the missions are conducted under the direction of bishops or vicars-apostolic chosen from the general body. Members take the three ordinary vows of religion, and bind themselves to the Congregation, first temporarily, but afterward perpetually.

HOLY INFANCY, BROTHERS OF THE.—The Brothers of the Holy Infancy consecrate themselves to the care of children, the education of the young and the reformation of juvenile criminals. They direct a Roman Catholic protectory at West Seneca, N. Y.

HOLY SAVIOUR, COMPANIONS OF THE.—A congregation in the Protestant Episcopal Church established for clergymen and such laymen as may be preparing for holy orders. Its members pledge themselves that, while in the Congregation, they will keep a simple rule of prayer, meditation and study in divine things.

IMMACULATE CONCEPTION, REGULAR CANONS OF THE.—Its object is the education of the clergy for parish work as well as the education of seminarians, and yet with many houses in Europe and 16 in Canada, the institute is not represented in the United States.

JESUITS, or SOCIETY OF JESUS.—An order founded by Saint Ignatius Loyola in the early part of the 16th century. See **JESUITS.**

JOSEPHITE FATHERS.—The Josephites, or Sons of Saint Joseph, a congregation founded in Belgium (1817) and devoted to the Christian education of youth. The title is also applied to the members of Saint Joseph's Society of the Sacred Heart for Colored Missions, a society which was established in Baltimore in 1871 and which now has charge of negro missions in many parts of the South and conducts several educational institutions for colored men and boys.

LA SALETTE, MISSIONARY FATHERS OF.—A congregation founded at the shrine of Our Lady of La Salette, by Philibert de Bruillard, bishop of Grenoble, in 1852, in commemoration of the apparition which had made the shrine so famous (19 Sept. 1846). The purpose of the Congregation is based upon the teachings of "Our Lady in her Apparition," and is (1) to labor for the conversion of sinners by the preaching of missions and retreats, and (2) to devote special attention to combating the crimes of the age that were "recalled by the sorrowful voice of the Mother of God at La Salette."

LAZARISTS.—The Congregation of the Priests of the Mission, founded in 1624 by Saint Vincent de Paul, have always been popularly known as Lazarists, probably because of the fact that they were early located at the College of Saint Lazare in Paris. The institution was founded for the direct purpose of preaching missions in country districts in order that the peasantry might be awakened to the danger of making bad confessions, but the avowed object of its members as specified in its constitution, confirmed by Urban VIII in 1632, is (1) the sanctifications of its own members, (2) the work of preaching missions and (3) the training of an exemplary clergy. At the present time the Congregation has houses in almost every part of the world, many Asiatic missions having been placed in their charge at the suppression of the Jesuits, in 1773.

MARIAN FATHERS.—An Italian congregation which has an American representation in the archdiocese of Chicago.

MARIST BROTHERS, or LITTLE BROTHERS OF MARY.—An order founded at Laval, France, in 1817, by the Venerable Joseph Benoit Marcellin Champagnat. The object is the education of youth.

MARIST FATHERS.—The Marists, otherwise known as the Society of Mary, is a religious order founded, about 1816, by Very Rev. Father Colin, who desired to establish an association which should unite the work of education with that of preaching missions. In 1818 Pope Pius VII expressed his approval of the project, and, thus encouraged, Father Colin proceeded with his work of organization. From the beginning the Society has devoted itself to the foreign missionary field. In 1836, the Congregation of the Propaganda entrusted the organization with the work of spreading the faith in western Oceania, and while no Catholic priest had ever visited the islands, the Marist Fathers penetrated even to the most savage tribes and everywhere succeeded in making converts

to Christianity. Many missionaries were martyred by the cannibals, but, never discouraged, the Fathers returned to the work of civilization and salvation. The order is now represented in nearly every part of the world.

MARY OF MONTFORT, COMPANY OF.—Founded by Blessed Louis Marie Grignon de Montfort in 1713, to preach missions and retreats and do missionary work. In the United States the Society has a house in the diocese of Brooklyn.

MARY OF PARIS, SOCIETY OF.—Founded for the purpose of educational and missionary work, the Society is extensively represented in all countries. The members are also known as "Brothers of Mary."

MAURISTS.—The popular name for the members of the Congregation of Saint Maur, that offshoot from the Benedictine order which became so famous during the 18th century, especially for its literary achievements. Founded, in 1618, by Dom Benard, as a more austere branch of Benedictines, it immediately received the support of high ecclesiastical authorities, and its influence extended throughout the country. While its early history was marked by its fervor for the religious life, its later record was not so brilliant. Infected by Jansenism; overrun by a demand for a relaxation of almost every rule; tainted by the pseudo-philosophic spirit of the age, and, in some places, even by Freemasonry, the dissensions which were awakened by the opposing factions would have been sufficient to have wrecked the order ultimately even if the suppression of 1792 had not come to put an end to its existence.

MECHITARISTS.—A congregation founded by Mechitar, an Armenian youth of an ancient Catholic family, in the early part of the 18th century. While a firm adherent of his Church, his love for his nation was so great that he determined to devote his life to the instruction and improvement of his people. From the time of his ordination as priest, in 1699, it was his ambition to found a convent from which his educational work might be conducted; but while he made several unsuccessful efforts, it was not until about 1717, when he obtained the right to the island of San Lazzaro, from the government of Venice, that he was able to see his hopes realized. There he founded the great Armenian convent from which the works of the Mechitarist presses go forth to all parts of the world in which there are Armenians to read them.

MERCY, FATHERS OF.—An order founded in 1808 by Very Rev. Jean Baptiste Rauzon, vicar-general of Bordeaux, for the restoration of religion in France after the Revolution. At that time the Fathers were known as "Missionnaires de France." In 1834 the Society now called Fathers of Mercy was formed, its object being to give missions and retreats, to assist the parochial clergy in preaching and to conduct colleges, seminaries and other educational institutions.

MINORITES. See FRANCISCANS.

MISSIONS, CONGREGATION OF THE. See LAZARISTS.

MOST PRECIOUS BLOOD, CONGREGATION OF THE.—The Congregation of the Most Precious Blood, otherwise known as Sanguinist Fathers, was founded in 1823 by the Venerable Caspar del Bufalo. The object of the new congregation was to counteract the evil effect that the French Revolution and the subsequent wars throughout Europe had had over the minds of the people. By preaching missions and giving retreats the Fathers called attention to the Precious Blood, and their efforts succeeded in arousing such a spirit of devotion that by 1840 the community had spread over the whole of Italy and into other parts of Europe. In 1843 the order reached the United States and established communities throughout the Middle and Western States.

NAZARETH, BROTHERS OF.—A religious order for laymen in the Protestant Episcopal Church. Founded in 1886, its objects are "prayer and manual work."

OBlates.—A congregation of secular priests who, as their name implies, "offer themselves" to perform any duty that a bishop may assign. The first institution of this character was founded in 1578, when Saint Charles Borromeo, archbishop of Milan, organized a band of zealous priests as the congregation of "Oblates of the Blessed Virgin of Saint Ambrose." The experiment proved so satisfactory that several other congregations have since been organized, conspicuous among which are the Oblates of Italy, an association founded in 1816 to assume control of the missions of eastern Burma; the Oblates of Mary Immaculate, founded in 1816, and now represented by two provinces in the United States; the Oblates of the Sacred Heart, established in 1857, and the Oblates of Saint Francis de Sales, a congregation of priests with mother house in Rome and an American novitiate established in Wilmington, Del., in 1903, and transferred to Childs, Md., in 1907.

OBSERVANTINES. See FRANCISCANS.

OUR LADY OF LOURDES, BROTHERS OF.—A congregation founded in 1830 by Rev. S. M. Glorieux, who desired to institute an order whose duty it should be to care for the orphan, to promote the Christian education of the young, especially in the case of the poor, and to nurse and care for the sick and aged. By a decree dated 18 July 1892, Pope Leo XIII gave his full approbation to the order, which is widely represented both in this country and in Europe.

PASSIONISTS, or the DISCALCED CLERKS OF THE MOST HOLY CROSS AND PASSION OF OUR LORD JESUS CHRIST.—

An order founded by Saint Paul of the Cross, who assumed the habit of the order with the sanction of the bishop of Alessandria, in 1720. A year later, having formulated his rule of life, he went to Rome seeking permission to found his order. Although he was not looked upon with disfavor it was 1737 before the last obstacle was removed and the first monastery established. In 1746 the rules of the order were confirmed by Benedict XIV and, shortly afterward, Clement XIV favored the Fathers by conferring upon them the church of Saints John and Paul, on the Caelian Hill. From that day the Congregation rapidly extended, first throughout Italy, and, afterward, into other parts of Europe, even obtaining a good foothold in England by 1842. Ten years later the order was introduced into the United States by Bishop O'Connor of Pittsburgh. There are few orders that follow a more austere rule, for the Passionists fast three days in each week, as well as through Advent and Lent, and sleep little, rising to say all the offices in choir at the canonical hours. Their habit is simple, if not mean, nothing being worn on the feet but sandals, and all the time not given to the work of giving or preparing for missions or retreats is devoted to contemplation. Beside the three usual vows, members of this order take a fourth, that they will at all times do their utmost to keep the memory of the Lord's passion ever alive in the hearts of the faithful.

PAULISTS. See PAULISTS.

PICPUS.—There have been two congregations of Picpus, the first a reform of the Third Order of Saint Francis, which was instituted by Vincent Mussart in 1594; the second, a congregation founded by Pierre Coudrin, in the latter part of the 18th century. Having, like other seminaries, been dispersed by the French government, Coudrin formulated the plan for the organization of the Congregation which should not only undertake to prepare candidates for the priesthood and the missionary field, but should protest against the infidelity of the times by maintaining a perpetual adoration of the Blessed Sacrament. So well did he plead his cause that he aroused the sympathies of high ecclesiastics, and, in 1805, he was able to open the first house of his Congregation in the Faubourg Saint Antoine, Paris. By 1817, when the full approbation of the Holy See was obtained, the Fathers of Picpus were in control of several important educational institutions, and, in 1825, a company of the priests of the order were sent to the Pacific islands by Leo XII, in the hope that they might convert the savage natives to Christianity. From that time most of their activity has been devoted to missionary endeavors, and the fact that their membership has included such men as Father Damien, whose work among the lepers will never be forgotten, explains the reason for their great success in the mission fields.

PIOUS SOCIETY OF MISSIONS.—Founded in 1835 by Venerable Vincent Mary Pallotti, its object being to preserve the faith among Catholic emigrants and to propagate the faith among non-Catholics and infidels. The Fathers started their first American Italian mission in New York City in 1883 and the society has since extended its influence throughout the United States.

PREACHERS, ORDER OF. See DOMINICANS.

PREMONSTRATENSIA NS.—An order of regular canons founded by Saint Norbert at Premontre, near Laon, in 1119. The rule of the order is that of Saint Austin, its habit white, whence its members have frequently been known as "White Canons." While its founder imposed perpetual fasting and an entire abstinence from meat as an inviolable rule, a gradual relaxation occurred, and from time to time the order was threatened first by one then by another of the several reform movements which were instituted. In spite of this it flourished and, at one time, there were more than a thousand Premonstratensian houses in various parts of Europe. Then came the religious disturbances in England, the Reformation, and, finally, the Revolution, at the close of which only eight houses remained undisturbed. Since that time a few more houses have been opened, especially in England, but there is no comparison between the present almost impoverished institutions and the order which was once such a powerful influence in the religious life of Europe.

RECOLLECTS.—A branch of the Franciscan order which has been in existence for more than three centuries. Although originally (1597) the French branch of the reform movement led by the friars of the Strict Observance its members have guarded the austerity of their rule so zealously and have kept so free of any taint of Jansenism that many favors have been shown them, one being the order which placed them in charge of the convent at Jerusalem.

REDEMPTORISTS, or CONGREGATION OF THE MOST HOLY REDEEMER.—A congregation founded by Saint Alphonsus Maria de Liguori at Scala, in 1732, as the result of his experience in evangelistic work among the poor. Both in the great cities like Naples and in the rural districts which he had visited for the purpose of giving missions Alphonsus had found a moral and spiritual destitution which appealed to him as most pitiable, and it was his desire to institute an order of zealous men who should be willing to strive to copy the life of Jesus Christ in all things, especially in following His example of evangelistic work among the poor and needy, that led to the formation of this congregation. Beset

by many obstacles and hindered by opposition from strong political sources Saint Alphonsus persisted in his work. One by one houses were founded in different parts of the papal states, gradually they spread beyond the Alps, and when, in 1749, Pope Benedict XIV approved its rule the Congregation was in a most prosperous condition. Originally called the Congregation of the Most Holy Saviour, the name was changed to that of the Most Holy Redeemer, by order of the Pope, but its rule remained unchanged. The members not only take the three simple vows but make a fourth, a vow of perseverance until death in the institute, and their vow of poverty binds them to refuse all dignities and offices that may be tendered them outside the Congregation. The chief occupation of the Redemptorists is the preaching of missions and retreats to persons of all classes, but especially to those who are most neglected by other clergy. In fact so anxious was the founder that the Congregation would pursue this principle, that he forbade its members to undertake any educational work that might distract their minds from the neglected poor to whom he desired them to devote their lives. The order, which still flourishes, is under the direction of a superior called the Rector Major who is elected for life.

RESURRECTION, CONGREGATION OF THE.—Founded in Paris in 1836 and devoted to educational and missionary work; represented in the United States in Illinois and Kentucky.

ROSMINIANS, or FATHERS OF CHARITY.—A congregation founded in 1828, by Antonio Rosmini, for the purpose of promoting works of charity of every sort, an aim which was fully realized, for during the first 10 years of its existence its members were engaged in preaching and teaching, in giving retreats, in visiting the sick, in missionary work at home and abroad, in caring for prisons and hospitals, in almsgiving and in general literary labors. During this period the order had extended to England and it is now represented by houses in almost every part of the world.

SACRED HEART, BROTHERS OF THE.—A congregation founded at Lyons, France, in 1820, by Père André Coindre, a member of the Society of Missions. The two objects of the institution are (1) self-sanctification by devotion to the Sacred Heart, and (2) the Christian education of youth in schools, asylums and colleges. In September 1900, at a general chapter held in France, two new provinces were established, one for the United States and the other for Canada. A novitiate house for the United States was opened at Metuchen, N. J., in June 1901, and this is now the official residence of the provincial of the order.

SACRED HEARTS OF JESUS AND MARY, CONGREGATION OF THE.—Also known as the "Congregation of Picpus"; founded in France in 1769, for the perpetual adoration of the Blessed Sacrament and the promotion of devotion to the sacred hearts of Jesus and Mary. In 1825 the evangelization of the Sandwich Islands was entrusted to the Society. The congregation is represented in California, Texas and Massachusetts. See also PICPUS in this article.

SAINT CHARLES BORROMEO, CONGREGATION OF THE MISSIONARIES OF.—A congregation founded by Bishop Scalabrini at Piacenza, Italy, in 1887, its object being to provide missionaries to the Italian emigrants to North and South America. Although the scope of work and aim of the Congregation is restricted to this field, the institution of the order met with the warmest approval of Pope Leo XIII, and his letter of 1888, addressed to the archbishops and bishops of America, in which he expressed his interest in the purpose of the new organization, did much to further its work in this country.

SAINT EDMUND, SOCIETY OF.—An English congregation with an American house at Swanton, Vt.

SAINT FRANCIS SERAPHICUS, POOR BROTHERS OF.—An institute founded 24 Dec. 1857 by Philip Hoefer, principal of Saint Peter's Parish School, Aix-la-Chapelle, Germany. Its object is the promotion of the Christian education of youth.

SAINT GABRIEL, BROTHERS OF.—An institute founded in 1705 by the Blessed Louis Marie Grignon de Montfort. Its object is the education and Christian instruction of youth as well as the care of deaf, dumb and blind institutions and orphan asylums.

SAINT JOHN THE EVANGELIST, SOCIETY OF MISSION PRIESTS OF.—Founded by several ritualistic clergymen of the Church of England, at Cowley, England, in 1865, the objects of this society are to assist its members in striving after Christian perfection and to work for the advancement of God's glory by conducting missions and retreats, and by such other methods as He may suggest. The first company of Fathers arrived in the United States in 1872, and they are now extremely influential, especially in High Church circles.

SAINT JOSEPH, ORDER OF.—A title that has been borne by two communities: (1) the Order of Priests of the Mission of Saint Joseph, a congregation founded by Jacques Cretenet, at Lyons, in 1640. Its purpose was devotion to foreign missions. It was suppressed by the Revolution. The present bearer of the name is the Order of Saint Joseph, a teaching order founded at Grammont, Belgium, in 1817, by Canon Van Crombrughe, its purpose being the improvement of the education given the children of persons of the commercial and industrial classes.

SAINT JOSEPH'S SOCIETY OF THE SACRED HEART.—See JOSEPHITE FATHERS, in this article.

SAINT VIATEUR, CLERICS OF.—The community of the Clerics of Saint Viateur was founded in 1835 by Very Rev. F. L. M. J. Querbes, pastor of Vouries, near Lyons. Its objects are educational.

SALESIAN FATHERS.—The order of Salesians is a society of priests and lay brothers founded by Don Bosco, a priest of Turin, Italy, in 1864. In 1874 the order received the approval of Pope Pius IX. Its primary object is the rescuing of poor, homeless boys from the street, providing them with food and shelter in the institute of the Society.

SANGUINISTS. See MOST PRECIOUS BLOOD, CONGREGATION OF THE, in this article.

SERVITES (also known as Servants of Mary), a mendicant order founded in 1233 by seven pious merchants of Florence, who sold their property, distributed the money among the poor, and, taking up their abode in a small house, lived according to a rule of great austerity, supporting themselves by begging in the streets. Innocent III, in 1487, placed the Servites upon a plane of equality with the other mendicant orders. The order suffered greatly during the Reformation and the Revolution, but many of its houses have been rebuilt and there are now flourishing Servite establishments in many parts of the world.

STRICT OBSERVANCE, PRIARS OF THE.—An austere branch of the Franciscans established by Blessed John de Puebla, on the Sierra Morena, in Spain, 1489. The branch became a separate congregation and so remained until 1897.

SULPICIAN.—A society of priests founded in 1642 by Abbé Jean Jacques Olier at the seminary of Saint Sulpice in Paris. The members devote themselves to the direction of theological seminaries.

SYLVESTINE BENEDICTINES. See BENEDICTINES.

THERESIANS.—A name applied to those Discalced Carmelites who live under the reform rule of Saint Theresa.

TRAPPISTS.—A reform of the Cistercian order instituted in 1662 by Armand Jean le Bouthillier de Rance. Assuming control of the abbey of La Trappe, in 1660, he found it in a most deplorable condition. The Cistercian rule had been so far relaxed that many of the members had ceased to live in community, and de Rance devoted all his efforts to the restoration of regularity and order. Establishing what he called the "Strict Observance of the Cistercian Order," he succeeded in persuading some monks of the Strict Observance to come to his assistance, and together they completely restored the discipline of the monastery. From La Trappe this austere rule spread into other parts of Europe where it met with such instant favor that some of the most flourishing monastic houses in the world are now those of the Trappist reformers.

VINCENTIAN PRIARS. See LAZARISTS.

WHITE PRIARS. See CARMELITES.

XAVERIAN BROTHERS.—A teaching institute founded at Bruges, Belgium, by Theodore James Ryken, in 1846. The purpose of the founder was to organize "a congregation of men who would willingly sacrifice their lives to the Christian education of youth," an object which has been adhered to so closely that the order has long been regarded as one of the most successful teaching institutes of the Church.

ORATORIES.

The Oratory which has been such an important factor in the evangelistic work of the Roman Catholic Church, especially in England, had its inception in the mind of Saint Philip Neri, a native of Florence in the 16th century. Always conspicuous for the purity of his life and the desire to do good for young men, he early gathered about him a number of sympathetic souls who were ready to follow his guidance in order that they might lead a life of greater religious regularity. Although still a layman he preached to them in private, teaching them how to show more zeal for God, without retiring from the world. In 1551, upon the advice of his confessor, Philip received holy orders, but even then he continued to receive his congregation in private, either in his own room or in a larger chamber, and it was from these daily colloquies that he evolved the system of evening exercises which has always been maintained by his Congregation. This consists of a popular devotional exercise, a few hymns and a plain sermon preached, somewhat conversationally, directly at the hearts of the people. These exercises, which were held on every week-day evening except Saturday, became so popular that, in 1558, he obtained permission to build a chapel in the church of Saint Jerome. He called it an "oratory," and it was from this that his Congregation obtained its name. It was at about this time that Philip's work attracted the attention of some of the most zealous churchmen in Europe, and so many of them joined him that, in 1564, he felt justified in assuming charge of the church of Saint John the Baptist which had just been completed at Rome. In 1575 the Congregation had so increased in numbers that it was deemed necessary that they should have an establishment of their own, and the old church of the Valli-cellì being ceded to them, Philip began the erection of the

present edifice, called the "Chiesa Nuova," on the old site. At its completion he rejoined his Congregation, the constitution of which had already been approved by Pope Gregory XIII, and remained in Rome until his death, in 1595. The conception which was the basis upon which Saint Philip founded his Congregation was that there were people in the world who were not in sympathy with the work of the monastic orders but who might be reached if sought in another way. He proposed, therefore, that his Congregation should be composed of simple priests. They should take no vows, and while they should be bound by a certain rule of life while associated with the community, they might withdraw without reproach at any time. To his followers he taught his methods, imbuing them so zealously with the spirit of his work that it is still conducted as if he himself were present to direct it. Instead of taking a combative position he assumed one of tranquillity. Instead of going out in search of sinners he sat in his own room and let them come to him. He abhorred all that savored of the systematic; he made few attempts at the exposition of doctrine, and he avoided the catechetical schools. Instead he accepted the inevitable, the conditions which he knew he could not change, and simply tried, as Cardinal Newman said, "to sweeten and sanctify what God had made very good and man had spoiled." With unaffected humility and love he gathered "his family" around him, and they, convinced by the eloquence of his personal character, took up his work and followed him. For nearly three centuries the work of the Oratory was confined to Italy, but, in 1847, Dr. Newman introduced it into England. The first house was instituted at Mary Vale, or Old Oscott, but, in January 1849 it was transferred to Alcastre street, Birmingham. A few months later Father Frederick Faber, one of the most eloquent of the Oratory has ever produced, opened another house at King William street, Strand, London, where, assisted by several of the priests from Birmingham, he soon gathered a large congregation of listeners. For about a year the London house was in affiliation and under the direction of the house at Birmingham, but as such a system was not entirely in keeping with the spirit of the constitution, which provided that each house should be independent, the London Oratory was released from its obedience to the older oratory in 1850, and, shortly afterward, it was transferred to Brompton, from which place it has exerted a wide influence over Catholic thought in England. During the history of the Roman Catholic Church other congregations have adopted the title of "The Oratory." In 1611 Cardinal de Berull of Paris organized a society of priests under this name, which, in 1614, was changed, by Pope Paul V, to "The Congregation of the Oratory of Our Lord Jesus Christ in France." Like the Italian Oratory of Saint Philip, the members of the French society were simple priests. As Bossuet says, its founder "preferred to give no other spirit to his company but the spirit of the Church itself, no other rule than her canons, no other superiors than her bishops, no other bond but charity, and no vows but those of baptism and ordination." The object of this organization was chiefly to promote the spirit of devotion among the secular clergy, a work which was partly conducted by the institution of seminaries for the education of candidates for the priesthood. At the death of the founder, in 1629, the Congregation was represented by more than 50 seminaries, colleges and houses of retreat, while it was generally admitted that the Society had been the means of deepening the ecclesiastical devotion and strengthening its discipline, an influence which was already making itself apparent throughout the entire population. After the death of the cardinal the work was continued under the direction of Père de Condren, who was followed by other good men and strong leaders, and while for a time its usefulness as a Church organization was threatened by the influence of Jansenism, which found many converts among its members, the orthodox section finally proved the stronger, and the bull was accepted by the vote of the Congregation in 1746. When other orders were immediately suppressed by the Revolution the Congregation's valuable work in the cause of education saved it for a time and it might have passed through those troublous times without molestation if the Fathers themselves had not resisted the authorities by refusing to be present at certain services appointed to be held in their own church. Later a few of the members took the oath required, but the Congregation never regained its influence. In 1852 a congregation known as the "Oratory of the Immaculate Conception" was instituted at Paris by the Abbé Gratry and M. Petetot, curé of Saint Roch. Later this organization adopted the rule of the French Oratory.

ORDERS OF WOMEN.

The following is a list of the most prominent orders of women that have been or are now in existence in the Roman Catholic and Protestant Episcopal churches and that have houses in the United States:

ALL ANGELS, COMMUNITY OF.—A sisterhood in the Protestant Episcopal Church. Founded by the bishop of

Delaware and incorporated in 1895, its members are engaged in all kinds of educational and charitable work, including the care of a day nursery and orphanage for factory children. The order is under the direction of the bishop of Alabama.

ALL SAINTS' SISTERS OF THE POOR.—An order established in the Church of England in 1851 by Rev. W. Upton Richards, and introduced into the United States by the bishop of Maryland in 1890. Its members have undertaken all kinds of charitable and educational works, ranging from fashionable boarding schools for young ladies to day mission schools for colored children.

ANGELICALS.—An order of nuns, followers of the rule of Saint Augustine, founded by the Countess of Guastalla, in 1530.

ANNUNCIATION OF THE BLESSED VIRGIN MARY, SISTERS OF.—A society incorporated in 1893 to receive and care for incurable and crippled girls between the ages of 4 and 16 years.

APOSTOLINE SISTERS.—An order founded at Loda, Ill., 15 Aug. 1884, by Rev. Louis Heidemann. Its object is the education of youth.

ASSUMPTION, SISTERS OF THE.—An order founded by Monsignor Affre, archbishop of Paris, in 1839. It is chiefly an educational order. The Little Sisters of the Assumption nurse the sick poor in their own homes night and day; caring for the children and the house in order that the home may not be broken up during the illness of some of its members. For these services they accept no pay, not even food.

ATONEMENT, SISTERS OF THE SOCIETY OF THE.—Founded as a Protestant Episcopal religious order for women and received into the Roman Catholic Church, with the other branches of the Society of the Atonement, 30 Oct. 1909.

BAPTISTINE SISTERS.—The Baptistines were founded in 1730 and the mother house, in Rome, was established in 1755. In the United States, the Sisters conduct orphan asylums and day nurseries in New Jersey and New York.

BERNADINE SISTERS.—An order of women devoted to educational work. The Bernadine Sisters of Esquermes conduct an academy in Nebraska. The Polish order of Bernadine Sisters of Saint Francis conducts both schools and orphanages in several cities of Pennsylvania, the mother house being at Reading.

BETHANY, SISTERS OF.—An order founded in New Orleans, La., and now under the pastoral care of the Episcopal bishop of that diocese. Its object is the care of neglected children.

BON SECOURS, SISTERS OF.—Instituted by Monsignor de Quelen, archbishop of Paris, 1822, for the purpose of caring for the sick in their homes and for the orphans in asylums provided for them. The Sisters of Notre Dame de Bon Secours, founded in 1840, by Rev. Paul Sebastian Millet of Troyes, France, has practically the same object.

BLESSED SACRAMENT SISTERHOODS.—The orders of Blessed Sacrament nuns are of recent origin. Those of the Perpetual Adoration, as their name implies, devote their constant attention upon the devotions to the Holy Eucharist. The Sisters of the Blessed Sacrament for Indians and Colored People is an American order, founded in 1889, by Mother Mary Katherine. Its purpose is the elevation, education and christianization of the two races.

BLESSED VIRGIN MARY, INSTITUTE OF.—One of the few Roman Catholic orders of English origin instituted since the Reformation, it was founded by Mary Ward, the daughter of a gentleman of large estate, in 1611. A teaching order of the highest class, it prospered from the first, and it is still a flourishing religious institute, being popularly known as "the Institute of the English Virgins." The rule of the order has always been practically the same as that of the Society of Jesus.

CARMELITES.—The female branch of the Carmelites, founded in 1452 and reformed by Saint Theresa in 1562. It is largely represented in the United States, with mother house at Baltimore and 10 monasteries. (See CARMELITES). The Carmelite Sisters of the Divine Heart of Jesus came to America in 1912 and now have houses in Indiana and Texas.

CENACLE, LADIES OF THE.—An order founded in France in 1826, the Sisters devoting themselves to the perpetual adoration of the Blessed Sacrament and to spiritual works, especially in giving retreats and teaching Christian doctrine. The Society now has several houses in the United States, the first having been established in 1892.

CHARITY, SISTERS OF.—There are many orders and branches of orders in the Roman Catholic Church which bear the name of Sisters of Charity. Some of them are also called "Gray Sisters," or "Gray Nuns," "Daughters of Charity," "Sisters of Saint Vincent de Paul," etc. The oldest order was founded in Paris in 1634, by Saint Vincent de Paul, assisted by Mlle. Louise le Gras, and its constitution has never been changed. Instead of making perpetual vows the Sisters take the simple vows, which are renewed annually, when they also add a fourth vow, binding themselves to care for the sick. The order of Sisters of Charity in the United States was founded by Mother Seton, who, after her conversion to the Roman Catholic faith, devoted her life to the charitable works of the Church. Her first

community, which was known as the Sisters of Charity of Saint Joseph, was established at Emmitsburg, Md., 31 July 1809. The Sisters of Charity of Cincinnati, Ohio, are a branch of the order founded by Mother Seton. The Sisters of Charity of Saint Paul are a congregation largely devoted to teaching. It was founded in 1704 by M. Chauvet, a French curé, assisted by Mlle. de Tilly. The Sisters of Charity (Irish) are an order which is very similar in purpose to that founded by Saint Vincent de Paul. Its members minister to the sick and poor in hospitals and at their own homes. It was founded in 1815 by Mrs. Mary Frances Aikenhead. The congregation of Sisters of Charity of the Blessed Virgin Mary devote themselves exclusively to the education of youth. The order was founded in Philadelphia, Pa., by Very Rev. Terence James Donoghoe, assisted by Mother Mary Francis Clarke, its first superior-general, on 1 Nov. 1833. The Sisters of Christian Charity devote themselves to educational work and to the care of poor and orphaned children. The Sisters of Charity of Nazareth are an American community, founded in 1812. The founders of Nazareth were Rt. Rev. J. B. M. David of Bardstown and Catherine Spalding. Branch houses were established in Bardstown in 1818 and at Saint Vincent's, Union County, Ky., in 1820, and in 1829 the Congregation was incorporated by the legislature of Kentucky under the title, "Nazareth Literary and Benevolent Institution." On many occasions since their foundation the Sisters have performed heroic service, notably during the cholera epidemic, 1832-33, caring for the soldiers during the Civil War, in the yellow fever epidemic of 1878 and in other visitations of contagious disease. Out of the cholera epidemic of 1833 grew their first orphan asylum, Saint Vincent's, in Louisville. The Sisters of Charity of Our Lady, Mother of Mercy, are a congregation founded by the Most Rev. John Zwyzyn, archbishop of Utrecht, in 1832. Its purpose is the education of youth, as well as the care of the sick, aged and orphaned. The latest work undertaken by these Sisters is the care of the lepers at Paramaribo, Dutch Guiana. The order of Sisters of Charity of Providence was founded in Montreal 25 March 1843. Its work is educational and charitable, including the care of hospitals. The Sisters of Charity of Saint Elizabeth, the Sisters of Charity of Palletine, the Sisters of Charity of Saint Augustine and the Sisters of Charity of Our Lady, Mother of Mercy, are devoted to charitable and educational work. The Sisters of Charity, Servants of the Poor; Sisters of Charity of the Cross (Gray Nuns); the Sisters of Charity of the General Hospital of Montreal, the Sisters of Charity of Saint Louis and the Sisters of Charity of the Hospital of Saint Hyacinthe, are Canadian orders devoted to the care and education of the sick and poor.

CHARITY OF SAINT VINCENT DE PAUL, DAUGHTERS OF.—A society founded in 1633. The members are not bound by perpetual vows but take the simple vows of religion on the 25th of March of each year. The mother house is in Paris. There are two provinces in the United States where the Sisters conduct hospitals, insane asylums, orphanages, day nurseries, industrial schools and other establishments.

CISTERCIANS.—The female branch of the order of Cistercian monks.

CROSS, DAUGHTERS OF THE. See **GREY NUNS OF THE CROSS**, in this article.

CROSS AND PASSION, DAUGHTERS OF THE. See **PASSIONIST NUNS**, in this article.

DISCALCED CARMELITES. See **CARMELITES**.

DIVINE COMPASSION, SISTERS OF THE.—A congregation founded in 1873 by Rt. Rev. Mgr. Preston. Its object is the mental and moral training of young girls.

DIVINE SAVIOUR, SOCIETY OF.—A congregation instituted in Italy for the purpose of caring for the sick in their homes.

EPIPHANY, SOCIETY OF THE.—A Protestant Episcopal sisterhood, established in 1897 by the bishop of Washington, D. C. Its objects are the protection and training of the young, and the giving of spiritual assistance to women living in the world by providing retreats and religious instruction for them.

FAITHFUL VIRGIN, SISTERS OF THE.—An order founded in Normandy, about 1840. Its purpose is the care of orphans.

FELICIAN SISTERS.—Founded in Poland, in 1855. When suppressed by the Russian government, in 1864, the mother house was transferred to Cracow, Austria, where it is now located. The Congregation established its first house in the United States in 1874. It now has three provinces and conducts about 90 schools as well as orphanages, homes for the aged, day nurseries and homes for emigrants and working girls.

GOOD SHEPHERD.—There are several sisterhoods of the Good Shepherd. The oldest order, the Sisters of the Good Shepherd, was founded by Père Eudes, of the Eudist Fathers, assisted by Marguerite l'Ami, in 1641. The Sisters of Our Lady of Charity of the Good Shepherd of Angers are a community founded by Mother Mary of Saint Euphrasia Pelletier, in 1827. The Sisters of Our Lady of Charity of Refuge were also founded by Père Eudes (1651) and were

introduced in America by Rt. Rev. John Timon, bishop of Buffalo, N. Y., in 1855. Each of these orders has for its objects the training of young girls to virtue, and the reformation of fallen women.

GOOD SHEPHERD SISTERS.—There are now two branches of the sisterhood of the Good Shepherd in the Protestant Episcopal Church in the United States. The Saint Louis branch, incorporated in 1867, has charge over Bishop Robertson Hall, the diocesan school for girls; the California branch, Sisters of the Order of the Good Shepherd, has charge over the Old Ladies' Home, the Sheltering Arms, three hospital missions and the parish visiting.

GREY NUNS OF THE CROSS.—A community, founded in 1745, which takes its title from the color of the habit worn by the Sisters. For more than a century the activities of the community were confined to Canada but in 1857, a school was opened in Buffalo, N. Y., and 18 establishments are now conducted in the United States, including academies and other schools, hospitals, orphanages and homes for the aged.

HELPERS OF THE HOLY SOULS, SOCIETY OF.—A congregation which, instituted in Paris, France, was established in New York City in 1892. Its purpose is to visit and nurse the sick poor in their homes, and to provide religious instruction to children and adults, all its work being undertaken with the view of helping the souls in purgatory.

HOLY CHILD JESUS, SISTERS OF.—A cloistered sisterhood devoted to the care and education of children.

HOLY CHILD JESUS, SISTERHOOD OF THE.—An order established by the Protestant Episcopal bishop of Albany, for the purpose of conducting educational and charitable works in his diocese.

HOLY COMMUNION SISTERS.—There are two branches of the Sisterhood of the Holy Communion in the Episcopal Church, and both are established in New York City. The older branch, which was organized by Rev. Dr. Muhlenberg in 1852, was the first order of Episcopal Sisters to be established in America. Its members are engaged in parish visiting, nursing, the care of the altar service and clerical vestments, and in various kinds of educational and charitable work. The younger sisterhood conducts a shelter for respectable girls.

HOLY CROSS, SISTERS OF THE.—A congregation founded at La Mans, France, in 1839. Its objects are educational and the care of hospitals and orphanages. The first American novitiate was opened at Bertrand, Mich., in 1844, and this was rapidly followed by schools for Indians and other foundations. During the Civil War, about 70 of the Sisters were in charge of several important military and naval hospitals. The Congregation now conducts more than 60 institutions, including one college, schools, hospitals and orphanages. The Congregation of the Sisters Marianites of the Holy Cross was founded in France in 1841, and established its first American mission in Canada in 1843 and in the United States, at New Orleans, in 1851. In 1861 the Sisters opened the asylum of Saint Vincent de Paul, in New York City. The members of the Congregation take only simple vows and devote themselves to the care of the sick, the charge of orphans and the education of youth.

HOLY FAMILY.—There are several sisterhoods of the Holy Family. The oldest, the Congregation of the Sisters of the Holy Family, a colored sisterhood, was founded in 1842. The Sisters conduct educational and charitable establishments in the archdiocese of New Orleans. The Sisters of the Holy Family of Nazareth was founded in 1874 by Frances Siedliske, a noble Polish lady. The Sisters of the Holy Family in California devote themselves to the relief of the sick and the poor, caring for and educating very young children whose mothers are obliged to work. The Little Sisters of the Holy Family is a community founded at Memramcook, New Brunswick, in 1874. Its one purpose is the temporal care of educational institutions.

HOLY GHOST, SISTERS OF.—An order founded in 1850 by the late Archbishop Hennessy of Dubuque, Iowa. Its objects are: (1) The glory of the Holy Ghost, and (2) the promotion of Christian education. The order of the Sister-Servants of the Holy Ghost was founded in Stell, Holland, in 1889. There is no affiliation between these orders. The Congregation of the Daughters of the Holy Ghost was founded in Brittany in 1706, its members being known as the "White Sisters," from the color of their habit. When driven from France, in 1902, they were invited to the diocese of Hartford, by the late Bishop Tierney, and they now have about 25 houses in several dioceses. The Sisters of the Holy Ghost (for colored people) is an American society, established in 1886, and now conducts several houses in Texas.

HOLY HEART OF MARY, SISTER-SERVANTS OF.—An order founded by Rev. Father Delaplace of Paris, France, in 1860. Its members conduct all kinds of works of charity.

HOLY HUMILITY OF MARY, SISTERS OF THE.—A community founded in France, in 1854, by Rev. John Joseph Begel, assisted by Miss Antoinette Poitiers. In 1864 the entire community, with its founder, immigrated to the United States, and settled near the village of New Bedford, Lawrence County, Pa. The works of the Sisters include

teaching, the care of the sick, the education of orphans and the decoration of altars. The Sisters of the Humility of Mary, with mother house at Goldfield, Nev., conducts a school and hospital in the diocese of Sacramento.

HOLY NAMES OF JESUS AND MARY, SISTERS OF THE.—A community founded at Longueuil, Canada, in 1843. Its objects are educational.

HOLY NATIVITY, SISTERHOOD OF THE.—An order established in 1833, by Rt. Rev. C. C. Grafton, Protestant Episcopal bishop of Fond du Lac. Its members are engaged in various kinds of missionary and parochial work.

IMMACULATE CONCEPTION, SISTERS OF THE.—Founded in France in 1820 as a branch of the Institute of the Holy Family, the members devote themselves to educational work and visiting the poor. The Congregation conducts schools in the diocese of New Orleans.

IMMACULATE HEART OF MARY, SISTER-SERVANTS OF THE.—A congregation founded in Quebec, in 1850, by Most Rev. P. F. Turgeon, archbishop of Quebec, assisted by Mr. George M. Muir and Mrs. Mary Fitzback, who became Mother Mary of the Sacred Heart, the first superior of the order. The objects of the Congregation are two-fold: (1) The reformation of fallen women, and (2) the education of children. The Daughters of the Immaculate Heart of Mary, instituted in France, perform all kinds of charitable works, conducting academies, orphanages, female industrial schools, kindergartens, homes for working girls, mental and training schools for deaf-mutes, night refuges for homeless women, Indian missions, etc.

INCARNATE WORD AND BLESSED SACRAMENT, SISTERS OF THE.—An order founded at Lyons, France, by Venerable Jane Chezard de Matel, in 1625. The American foundation was made at Brownsville, Tex., in 1852. Although the order has many houses in various parts of the world they are independent of each other. The Sisters of Charity of the Incarnate Word are an American offshoot of the French community, having been founded by Rt. Rev. C. M. Dubois, bishop of Texas, in 1866.

INFANT JESUS, SISTERS OF THE.—A congregation devoted to the nursing of the sick poor in their homes without compensation. The mother house and novitiate is in Brooklyn.

JESUS, DAUGHTERS OF.—A congregation founded for the care of the sick poor and the education of girls. In 1893 Sisters were sent from France to open the first provincial house in America, at Three Rivers, Canada, and a few years later they came to the United States, where they have several establishments devoted to the education of youth and the care of the sick and orphans.

JESUS, SOCIETY OF THE FAITHFUL COMPANIONS OF.—A congregation instituted at Amiens, France, in 1820, by Mme. de Bonnault d'Houet (*née* de Bengy). While its main objects were and are the sanctification of souls and the improvement of female education, the order has been engaged in parochial school work for many years.

JESUS-MARY, RELIGIOUS OF.—A congregation founded at Lyons, France, in 1811, by the Abbé Coindre. Its purpose is the care of orphan asylums and the education of young girls, especially in boarding schools.

LA SAGESSE, SISTERS OF.—An order founded in 1703 by the Blessed Louis M. Grignon de Montfort, assisted by Miss Louise Trichet, afterward Sister Mary Louise of Jesus. Its works are educational and charitable.

LITTLE COMPANY OF MARY.—An order founded about 1870 in Nottingham, England. Its purpose is the care of the sick in their homes and in hospitals.

LITTLE SISTERS OF THE POOR.—An institute established in 1840 by M. la Pailleur, the curé of Saint Servan, in Brittany, and formally approved by the Holy See in 1854. Its object is the establishment of permanent homes for the aged and infirm of both sexes without distinction of creed or nationality. The Sisters of the Poor of Nazareth is an English offshoot from the Little Sisters.

LORETO NUNS.—There are several orders of Loreto Nuns, the oldest being that of the Ladies of Loreto, founded at Munich, Bavaria, by Mme. Maire, in 1650. Its first American house was established at Toronto in 1847.—The Society of Sisters of Loreto, or Friends of Mary at the Foot of the Cross, was founded by Rev. Charles Nerinckz, a Flemish missionary, in 1812. Another branch of the Sisters of Our Lady of Loreto was established by Mrs. Mary Teresa Ball, at Rathfarnham, near Dublin, Ireland, in 1822. It was from this foundation that have sprung the many convents of Loreto nuns in Ireland. Although not affiliated, the objects of the orders are very similar. Their work is educational and missionary.

MANTELLATE SISTERS.—A small congregation conducting a school in the diocese of Superior, Wis.

MARIST SISTERS.—An order founded by Father Colin of the Marist Order, in 1817. Its objects are educational.

MERCY, SISTERS OF.—An order founded in Dublin, Ireland, in 1827 by Miss Catherine McAuley, afterward mother superior. Besides the three vows the Sisters took a fourth to devote their lives to the service of the poor, the sick and the ignorant, an obligation which has been observed so zealously that the order has become one of the most important communities in the world. The sisterhood was introduced into the United States in December 1843, when

seven Sisters came from Carlow, Ireland, to establish a convent at Pittsburgh, Pa.

MERCY, SISTERS OF.—The Church of England order of Sisters of Mercy was founded about 1845 by Miss Lydia Sellon at Devonport. The only vow exacted is that of obedience during community life, and members are permitted to withdraw from the convents at will.

MERCY OF THE HOLY CROSS, SISTERS OF. See **HOLY CROSS, SISTERS OF THE**, in this article.

MISERICORDIE, SISTERS OF.—An order founded in 1848 by Monsignor Bourget, assisted by Mme. Roselle Jette, afterward Mother Saint Lucie, superior-general. Its objects are the care of the sick and of homeless infants.

MISSION HELPERS, INSTITUTE OF.—Founded at Baltimore, Md., in 1888, its Sisters visit the sick and poor in their homes and give religious instruction to children and adults. The direct object of the community is to advance the perfection and assist in the sanctification of the priesthood.

MOST HOLY CROSS AND PASSION, SISTERS OF THE. See **PASSIONIST NUNS**, in this article.

NOSTRA DOMINA, SCHOOL SISTERS DE.—A congregation established in Bohemia to conduct establishments for the care and education of youth. It has several houses of this character in the United States.

NOTRE DAME SISTERS.—There are several orders of the Sisters of Notre Dame. That of the School-Sisters of Notre Dame was founded in 1803 by the Venerable Julie Billiart, assisted by her friend, the Viscountess de Gezaincourt. Its object is the salvation of the souls of poor children. The Sisters of Notre Dame are a community founded at Montreal, Canada, in 1657, by the Venerable Mother Marguerite Bourgeoise. Its object is the instruction of youth. The Congregation of Notre Dame de Sion was founded at Paris in 1843; the Sisters of Notre Dame de Namur, in 1803.

OUR LADY OF CHARITY OF THE GOOD SHEPHERD, SISTERS OF. See **GOOD SHEPHERD SISTERS** in this article.

OUR LADY OF GOOD COUNSEL, SISTERS OF.—A community founded in 1894 by Bishop Labrecque of Chicoutimi. Its objects are solely educational.

OUR LADY OF THE HOLY ROSARY, CONGREGATION OF.—Founded at Rimouski, province of Quebec, Canada, 12 Sept. 1879, its object is the Christian instruction and education of the poor.

OUR LADY OF LOURDES.—The order of Our Lady of Lourdes was founded by Archbishop Perche of New Orleans, on 25 Feb. 1883.

OUR LADY OF MOUNT CARMEL, SISTERS OF THE CONGREGATION OF. See **CARMELITES**.

OUR LADY OF PERPETUAL HELP, SISTERS OF.—An order founded at Saint Damien, province of Quebec, Canada, by Rev. J. O. Brousseau, assisted by Mlle. Virginia Fournier, afterward Sister Saint Bernard, the first superioress of the community. Its objects are educational.

OUR LADY OF SION, CONGREGATION OF.—Founded at Strassburg, in 1842, by M. Alphonse Ratisbonne, of a wealthy Jewish family, in commemoration of an apparition of the Blessed Virgin Mary with which he claimed he was favored, and which had resulted in his conversion. The rule of the Congregation aims at the union of the active with the contemplative life, and its object, which has never changed, is the care and education of converts from Judaism. The most important houses of the Congregation are located in Palestine and Syria.

OUR SAVIOUR, REGULAR CANONASSES OF THE FIVE WOUNDS OF.—A congregation founded at Lyons, France. Its purposes are both educational and charitable.

PASSIONIST NUNS.—The first convent of Passionist nuns was established in Coronato, in 1771, by Mother Mary of Jesus Crucified, and several convents have since been opened in other parts of Europe. In May 1910, five Passionist nuns from Italy established their work in Pennsylvania. The Sisters of the Most Holy Cross and Passion is a second Order of Passionist nuns.

PERPETUAL ADORATION, RELIGIOUS OF.—The Congregation was founded at Brussels in 1857, and the members devote themselves, not only to the adoration but to all that tends to increase the devotion to the Blessed Sacrament. A foundation of the Congregation was established in Washington, D. C., in 1900. Among other congregations in the United States devoted to these purposes are: Benedictine Sisters of the Perpetual Adoration, with mother house at Clyde, Mo.; Franciscan Sisters of the Perpetual Adoration, mother house at LaCrosse, Wis.; Sisters of the Perpetual Adoration, in the diocese of New Orleans, and the Sisters of the Sacred Heart and of Perpetual Adoration, a French order with a convent at Fairhaven, Mass. The Perpetual Adorers of the Blessed Sacrament are also termed Sacramentine Nuns.

PIOUS SOCIETY OF MISSIONS, SISTERS OF THE.—A congregation founded to assist the priests of the Pious Society of Missions in their work by acting as teachers and catechists.

POOR CLARES. See **SAINT FRANCIS, SISTERS OF**.
POOR HANDMAIDS OF JESUS CHRIST.—A congregation of Sisters founded at Dernbach, Germany, in 1851, by

Miss Catherine Kaspers. Its rule, which was compiled by Rt. Rev. J. P. Blum, bishop of Limberg, and its objects, which are in the highest sense charitable, were approved by the Holy See in 1870. The order was introduced into the United States in 1868, by Rt. Rev. J. H. Luers, bishop of Fort Wayne, Ind.

PRESENTATION OF THE BLESSED VIRGIN MARY, ORDER OF THE.—An order founded in Ireland, 1777, by Miss Namo Nagle. At first there was no enclosure and members took simple vows only, which were renewed annually, but, in 1805, Pope Pius VII raised it to the rank of a religious order with solemn vows and strict enclosure. A fourth vow was then added by which the members bound themselves to devote their lives to the work of instructing poor girls in the precepts of the Christian faith.

PROVIDENCE, SISTERS OF.—The Sisters of Providence, who also devote themselves to the instruction of young girls, were founded in Lorraine, in 1762, by the Venerable Jean Martin Moye. The first institution of the order in America was opened at Saint Mary's, near Terre Haute, Ind., 22 Oct. 1840. There are several branches of the Sisters of Providence, including the Oblate Sisters of Providence, the Sisters of Divine Providence and the Sisters of Providence of Kentucky.

REDEMPTORISTS.—The Sisters of the Order of the Most Holy Redeemer are affiliated with the Redemptorist order of monks. They are strictly enclosed and contemplative and assist the missionaries by their prayers.

RESURRECTION SISTERS.—There are two orders of Resurrection Sisters in the Episcopal Church of the United States. The Sisters of the Resurrection were instituted by the bishop of Florida in 1891. Its members conduct an educational and industrial school for orphans. The Sisters of the Order of the Holy Resurrection were founded by the bishop of Georgia in 1894. The work of the members is of a charitable character.

SACRAMENTINE NUNS. See PERPETUAL ADORATION, RELIGIOUS OF, in this article.

SACRED HEART, LADIES OF THE.—The Society of Ladies of the Sacred Heart was founded at Amiens, France, by Père Joseph Varin, S.J., assisted by Mlle. Madeleine Sophie Barat, in 1800. The community, which is semi-cloistered and follows the rule of the Society of Jesus, has for its object the Christian education of youth in boarding and parochial schools. The Missionary Sisters of the Sacred Heart devote themselves to the care of the sick and the orphan as well as to general educational work. The Sisters of the Holy Union of the Sacred Hearts, a congregation founded at Douai, France, in 1828, by the Abbé Debrabant, restricts its efforts to works of an educational character. Its rule and constitution were arranged from the somewhat mild rule prescribed for the Visitation Nuns by Saint Francis de Sales. The Mission Helpers of the Sacred Heart conduct classes in rural districts and immigrant settlements, visit the poor and sick in their homes, instruct women and children in penal institutions and conduct schools for the deaf and dumb, industrial schools for indigent girls and orphanages. The mother house is in Baltimore.

SACRED HEART OF SAINT JACUT, SISTERS OF THE.—A French congregation in charge of domestic departments at seminaries and rectories.

SAINT AGNES.—The Sisters of Saint Agnes were founded at Fond du Lac, Wis., 1 Aug. 1870. Its objects are both charitable and educational.

SAINT ANN, THE SISTERS OF. were founded at Vaudreuil, province of Quebec, Canada, by Monsignor Ignace Bourget, in 1850. Its objects are chiefly educational.

SAINT AUGUSTINE, THE SISTERS OF. correspond to the Augustinian monks. While very old and widely represented in Europe there are but two branches of the order in America; the Sisters of Charity of Saint Augustine, established at Cleveland, Ohio, in 1850, by Sisters from Boulogne, France, and the Sisters of the Order of Saint Augustine now in charge of the Hospital of the Precious Blood, founded at Quebec in 1637, by Sisters from Dieppe, France.

SAINT BASIL THE GREAT, SISTERS OF THE ORDER OF.—A congregation under the Ruthenian Greek rite, the members of which conduct schools and orphanages. The mother house is at Philadelphia.

SAINT BENEDICT.—The order of Sisters, corresponding to the monks of Saint Benedict, was introduced into the United States by Rt. Rev. Boniface Wimmer in 1846. The first colony of Benedictine Sisters came from Eichstätt, Bavaria, and established their convent at Saint Mary's, Elk County, Pa. Many other convents have since been established in various parts of the country, including houses of the orders of the Benedictine Sisters of Perpetual Adoration, and the Oblate Sisters of Saint Benedict (Olivetans). In 1906 Benedictine nuns from Besses, Pyrenees, France, established a house at Saint Benedict, La., and are known as the French Benedictine Sisters.

SAINT BRIDGET.—The Sisters of Saint Bridget, or the Order of the Holy Faith, was founded in Dublin, Ireland, in 1857. Its purpose is the care over the religious education of poor girls and boys.

SAINTS CYRIL AND METHODIUS.—A congregation estab-

lished to conduct schools and orphanages. The mother house is at Plymouth, Pa.

SAINT CASIMIR, SISTERS OF.—The Institute of the Sisters of Saint Casimir was founded in 1908 and has for its purpose the education of children of Lithuanian birth or descent. The mother house is at Chicago.

SAINT CHRETIENNE, SISTERS OF.—A congregation which conducts schools in several New England sections. The provincial house is at Salem, Mass.

SAINT DOMINIC.—The order of Sisters, corresponding to the monks of Saint Dominic, was introduced into the United States by Rev. Thomas Wilson in 1822. The first convent was established at Springfield, Ky., from which mother house convents have been established throughout the country. Their objects are educational and charitable. The Dominican Nuns of the Second Order are strictly cloistered and have perpetual adoration of the Blessed Sacrament. The Dominican Sisters of the Third Order of Saint Dominic were brought to this country in 1876, by Rev. J. Rochford, O. P., then provincial of the order. The Sisters conduct parochial schools and institutions for destitute children of both sexes. The community of Dominican Sisters known as the Congregation of Saint Catherine de Ricci, was founded by Rt. Rev. Bishop McNeirney of Albany, N. Y., in 1880. Their objects are to give retreats for women and young girls, to prepare candidates for the sacraments, and to offer prayers and penance for the conversion of sinners, especially drunkards and blasphemers. The Dominican Sisters of the Perpetual Rosary, as the name implies, are in charge of the management of the Perpetual Rosary in America. Their house at West Hoboken, N. J., was established in 1891 by Sisters from Bon Secours, France. The Dominican Sisters of the Sick Poor, are founded for the purpose of caring for the sick poor in their homes free of charge. The Sisters of Saint Dominic of the Congregation of Saint Rose of Lima is a congregation founded by Mother Mary Alphonsa Lathrop, the daughter of Nathaniel Hawthorne, and has for its object the care of those who are suffering from incurable cases of cancer.

SAINT DOROTHY, SISTERS OF.—A small congregation with mother house in Rome. It has three establishments in the United States.

SAINT FRANCIS.—The first mother house of the Franciscan Sisters to be instituted in this country was that of the Third Order of Saint Francis established by the late Bishop Neumann at Glen Riddle, Pa., in 1855. At the present time the following orders of Saint Francis are represented in the United States: The Little Franciscan Sisters of Mary, founded at La Bait Saint Paul, Canada, 1891; the Franciscan Missionaries of Mary, founded in British India about 1850; the Sisters of Saint Francis, founded by Very Rev. Pamfilo di Magliano, O.F.M., the Sisters of Saint Francis of Mary Immaculate, founded in 1865; the Sisters of Saint Francis, established at Buffalo, N. Y., in 1874; the Sisters of the Third Order of Saint Francis, founded by Rev. J. L. Bihn in 1869; the Sisters of the Third Order Regular of Saint Francis, incorporated as the Sisters of Saint Francis of Oldenburg in 1885; the Sisters of Saint Francis of the Sacred Heart; the Franciscan Sisters, founded in 1872; the Sisters of the Third Order of Saint Francis of Assisi, M.C.; the Sisters of Saint Francis, founded in 1875; the School-Sisters of Saint Francis; the Franciscan Sisters for Colored Missions, established in 1881; the Franciscan Sisters of the Perpetual Adoration, founded by Rt. Rev. M. Heiss in 1864; Franciscan Sisters of Christian Charity, founded in Wisconsin 9 Nov. 1869; Franciscan Sisters of the Sacred Heart, established in 1876; the Hospital Sisters of Saint Francis, founded in 1875; the Poor Sisters of Saint Francis of the Perpetual Adoration, established in 1875; the Sisters of the Poor of Saint Francis; the Sisters of Saint Francis, founded in 1890; the Franciscan Sisters of the Immaculate Conception, established 1891; the Missionary Franciscan Sisters of the Immaculate Conception; the Felician Sisters, O.S.F.; the Sisters of the Third Order of Saint Francis, under the protection of Saint Kune-gunda, Polish; the Polish Franciscan School Sisters; the Sisters of the Third Order of Saint Francis of the Congregation of Our Lady of Lourdes, established 1877, and others. The Order of the Poor Clares is also well represented in the United States, the first Sisters having come from Rome, Italy, to open a house in Cleveland, Ohio, in 1875. As the Second Order of Saint Francis, the Clares are the oldest of the Franciscan orders for women, its founder, the virgin Saint Clare, having been received by Saint Francis in 1212.

SAINT JOHN THE BAPTIST, SISTERHOOD OF.—An order in the Church of England, founded at Clewer, England, in 1851, and introduced into the United States in 1881. The work of its members is chiefly educational.

SAINT JOHN THE EVANGELIST, SISTERS OF.—The sisterhood of Saint John the Evangelist of the diocese of Long Island is an American order in the Episcopal Church. Its work is chiefly charitable.

SAINT JOSEPH.—There have been several sisterhoods of Saint Joseph, some of which have attained important positions in the religious world. The Lay Hospitaliers, Daughters of Saint Joseph, was once one of the great orders of France. It was founded by Marie Delpuch, at Bordeaux, in 1638, for the purpose of educating orphan girls, but it did not

survive the Revolution.—The Nun Hospitallers of Saint Joseph, an order that also became practically extinct at the time of the Revolution, was founded by Mlle. de la Farre at La Flèche in Anjou in 1643. In addition to the three vows of religion these nuns bound themselves to devote their lives to the service of the poor. At present they are represented by several houses in Canada, one, the Hospital of Saint Joseph of Ville Marie, having been founded by Mlle. Jeanne Mance in 1644.—The Sisters of Saint Joseph of the Good Shepherd is a congregation founded by Henri de Maupas, bishop of Puy, in 1650. Dispersed by the Revolution, it was reorganized in 1811. In 1836 six Sisters from Lyons came to the United States at the request of Bishop Rosati of Saint Louis, and they established a house of their order at Carondelet. The Sisters have always conducted all kinds of charitable work, including the gratuitous instruction of poor children and the care of such establishments as orphanages, institutions for the deaf and dumb, Indian and negro missions and Magdalen asylums. The Sisters of Saint Joseph, an offshoot from the Sisters of Saint Joseph of the Good Shepherd, were established at Toronto, Canada, in 1850 by Bishop Charbonnel.—The Sisters of Saint Joseph of Bourg were founded by Monsignor Devie, bishop of Belley, in 1828. Its members are engaged in teaching and works of charity.—The Congregation of Sisters of Saint Joseph of the Apparition was founded in France by Mme. de Vialard, in 1833. Its members are employed in teaching and in nursing the sick. The Sisters of Saint Joseph of Cluny are a community founded by Anne Marie Javouhey in 1807, although its first house was not formally recognized until 1819. Mother Javouhey was its first superior, and, as soon as possible, she established her Sisters in all the French colonies, where they devoted themselves to the education, the conversion and the civilization of the negro and other aboriginal races. The Sisters of Saint Joseph of Peace, a community founded in England, devote themselves to the training of girls for domestic service. In 1885 a branch of the sisterhood was established in Jersey City, N. J., by Bishop Wigger, and since that time the American house has extended the scope of its work until it now includes the care of the sick in their own homes, the care of a home and school for the blind, a hospital and a convalescent and summer home for poor working girls. The Hospital Sisters of Saint Joseph conduct hospitals in Chicago and Winoski, Vt. The Polish Sisters of Saint Joseph have a novitiate at Stevens Point, Wis.

SAINT JOSEPH OF NAZARETH, SISTERHOOD OF.—An order in the Protestant Episcopal Church established in 1892. Its objects are "the mutual improvement in religious knowledge of its members, and the furtherance of religious belief by means of the religious and community life, and afterward the exercise of charity in teaching and training the young."

SAINT MARGARET, SISTERS OF.—An order of missionary and nursing sisters, established in the Church of England, at East Grinstead, England, by Rev. J. M. Neale, D.D., in 1855. In 1873 an affiliated house was opened at Boston, Mass., and the American members of the order are engaged in conducting all kinds of hospitals, sanitariums and homes for incurables in various parts of the United States and Canada. Much of the work of the order is devoted to needy colored people.

SAINT MARTHE, SISTER SERVANTS OF.—The community of the Sister Servants of Saint Marthe was founded at Saint Hyacinthe, Canada, in 1890. Its members perform the housework for the diocesan seminary.

SAINT MARY, SISTERS OF.—The Institute of the Sisters of Saint Mary was founded by Rev. Dom Jerome N. J. Minsart at Namur, Belgium, in 1834, its object being the education of girls. In 1863 the order was introduced into the United States by Rt. Rev. John Timon, bishop of Buffalo, N. Y.

SAINT MARY, SISTERHOOD OF.—Incorporated in New York in 1865, the Sisterhood of Saint Mary is one of the largest orders of the Protestant Episcopal Church. Its members conduct hospitals, sanitariums and various other charitable and educational institutions in many parts of the United States.

SAINT MARY AND ALL SAINTS, SISTERS OF.—An order of colored women trained for work among their own people by the Protestant Episcopal Sisters of All Saints.

SAINT MARY AND LADIES CATECHISTS, MISSIONARIES OF.—A congregation founded to work among the Indians and the poor. The mother house is at Mission, Wash.

SAINT MONICA, SISTERS OF.—An order established by the Episcopal bishop of Springfield, Ill., for the purpose of instituting an association of widows "for intercessory prayer and the restoration to the Church of the primitive vocation of consecrated widowhood." The members are engaged in charitable works.

SAINT SAVIOUR, SISTERS OF.—An order in the Protestant Episcopal Church in California. Its members are engaged in the education of young girls.

SAINT THERESA OF JESUS, SISTERS OF.—Also known as Theresian Sisters, a teaching congregation with mother house in Spain and several establishments in Louisiana and Texas.

SALESIAN SISTERS OF THE HOLY EUCHARIST.—A congregation engaged in educational work in Baltimore and Pittsburgh.

SORROWFUL MOTHER, SISTERS OF THE.—A charitable and nursing order founded in Italy and introduced into the United States in 1889, its first house being established at Wichita, Kan.

TRANSFIGURATION, SISTERS OF THE.—A Protestant Episcopal sisterhood engaged in the care of homeless children and old ladies. Its labors are confined to Cincinnati, Ohio.

URSULINE NUNS.—The teaching order of the Ursulines was founded by Saint Angela Merici of Brescia, in 1537. Organized in Angela's kitchen as "The Company of Saint Ursula," its first objects were the nursing of the sick, the teaching of young girls and the sanctification of their own lives. At this time the members remained in the world, took no vows and received communion in common once each month. The conversion of the Society into a religious order was chiefly the work of Mme. de Sainte Beuve, a French woman, who built and endowed a convent for the congregation at Paris in 1610. Two years later Pope Paul V enclosed the nuns, placed them under the rule of Saint Austin, with solemn vows, including a fourth, binding them to devote their lives to the instruction of the young. The Irish Ursulines were established at Cork in 1771, by Miss Namo Nagle, and the first Ursuline convent instituted in the United States was founded by nuns from France at New Orleans 7 Aug. 1727. The Ursuline Sisters, a German congregation, conduct schools in the diocese of Bismarck.

VENERINI SISTERS.—An Italian congregation, with mother house in Rome, which conducts a school at Lawrence, Mass.

VISITATION NUNS.—The Order of the Visitation was founded at Annecy in 1610 by Saint Francis de Sales, assisted by Saint Jane Frances, Mme. de Chantai, their object being to found a retreat for persons desirous of the religious life, but who were too weak, or otherwise undispensed, to enter an austere order. As the result there were few corporal austerities, and little confinement, although the employment of time was minutely provided for. In 1618 the rule of the enclosure was adopted, and, although teaching was not a part of the founder's plan, all the American convents have devoted their attention closely to educational work. The first Visitation convent in the United States was established at Georgetown, D. C., in 1799.

WISDOM, DAUGHTERS OF.—A congregation founded in France. In the United States, the Sisters conduct several educational establishments, a hospital and a home for cripples and defectives.

DEACONESSSES.

The office of deaconess was one that was well recognized in the Apostolic Church, for while it may be questioned whether the certain references in the New Testament which have so generally been associated with the government of deaconesses really applied to them or not, the fact remains that some of the earliest writers of the Church recognized their usefulness and formulated rules of conduct for them. According to these rules it was necessary that a woman, to be a deaconess, should have been the widow of but one husband and that she should have borne children. It is true that exceptions were sometimes made and that virgins were occasionally admitted to these organizations, but this was a rare honor, it being the opinion of the Church authorities that no woman who had not been a wife and a mother would be able to feel that sympathetic devotion to her work which was so necessary to its success. As that was the time prior to the institution of sisterhoods and as the deaconesses were the only women who were officially authorized to assume Church work, there were many duties to which they were called. Among these was the care of the sick and poor, the ministering to those who were confined in prisons for conscience sake, the instruction of catechumens in the principles of their faith, assistance at the baptism of women, in addition to which they were supposed to exercise a general oversight over the female members of the congregations, both in public and in private, and were obliged to make regular reports that the bishops and elders might not be uninformed as to the conditions existing among their people. The work of the deaconesses continued until the middle of the 5th century. In the Greek Church such orders existed until the 12th century. Gradually, however, the sisterhoods took their place in the Church, and it was not until the 19th century that they were again revived, this time by the Protestant churches, who felt the need of the assistance of women in conducting their religious work. The first order of deaconesses to be instituted in the modern Church was in 1835 when Pastor Fliedner of Kaiserswerth, Prussia, established such a society in order that he might have an organized corps of nurses at his new infirmary, and the experiment was so successful that it was immediately copied by the Lutheran bodies in other parts of Europe. As instituted by Pastor Fliedner the "Order of Deaconesses of the Rhenish Province of Westphalia" was composed of three classes of members. The first class devoted themselves to the care of the sick poor and the rescue of fallen women by the means of Magdalen homes; the second class were engaged in teaching; while the third class, or visitation deaconesses, assumed the responsi-

bilities of the regular parochial work. The members took no vows and, while plainly dressed, wore no distinctive habit. In 1849, at the request of the American Church authorities, Pastor Fliedner brought four nurses to the United States where he established a home in Pittsburgh. In the Episcopal Church the work of the deaconesses is almost as important as that of the sisterhoods, it being of very much the same character. It is largely represented in the South, the branches in Georgia, Alabama, Kentucky and Louisiana being important factors in the religious work of the denomination. The revival of deaconess work in the Methodist Church dates from about 1870, when the Bethany Society was organized in Germany. Like the Order of Deaconesses established by Pastor Fliedner, its members were devoted chiefly to nursing, a work which they conducted so successfully that there are now more than 200 of them engaged in the various German hospitals. The first effort to introduce the order into the United States was in 1886, when Rev. J. M. Thoburn, at a conference held at Bellefontaine, Ohio, urged the advantage that the Methodists of this country would gain from the institution of a deaconess home or training school. As the result, Miss Jane M. Bancroft, later Mrs. Robinson, was sent to Germany to acquaint herself with the work of the organization and, in October 1887, a Deaconess Home was opened in Chicago. The next session of the General Conference signified its full approval of the movement and, in 1888, the present system of permanent deaconess work was inaugurated under the direction of the Woman's Home Missionary Society. According to the rules of conduct the purposes of the deaconesses are "to act as pastors' assistants; to visit from house to house; to assist in evangelistic work; to conduct meetings, especially those for women and children; to conduct kindergartens, kitchengartens; and other industrial and educational schools; to visit in prisons and police stations; to conduct orphanages, hospitals and other institutions of mercy; to nurse among the sick poor, etc., and to assist in office and clerical work." The Deaconess Society of the Methodist Episcopal Church was organized in 1895. It conducts hospitals, orphanages and schools, as well as other charitable works under the direction of its licensed deaconesses. The German Methodist deaconess homes and hospitals are under the control of the German Central Deaconess Board. The work of its deaconesses comprises, beside hospital service, nursing in private families, parish work, free dispensaries, kindergartens, industrial and sewing schools, etc. It has 78 deaconesses who operate five hospitals. The "Martha-Maria" Deaconess Society in Germany, which now operates in association with the Bethany Society, was originally organized by the Wesleyan Church. While now in perfect harmony with the sister institutions it still maintains its distinctive organization. Except in some few instances in the Protestant Episcopal Church the present-day deaconesses take no vows and may withdraw from the service of the Church at any time without reproach to themselves. They are usually disciplined during two probationary years, and, while they are unsalaried, they are assured of ample support, with a good home and tender care during sickness or old age. It is now customary in the United States for deaconesses to wear a habit, chiefly for purposes of recognition and protection, and, generally, they now live in communities or homes.

JOHN R. MEADER.

ORDERS OF ARCHITECTURE, the different styles of classic architecture as distinguished by the character of the column, its base, shaft, capital and the superimposed entablature. These elements constituting the unit of a colonnade are taken account of in distinguishing the various orders, of which there are five, the Doric, Ionic, Corinthian, Tuscan and Composite. Each type of the column seems to have persisted in its main characteristics from the earliest times while undergoing minor modifications in the way of refinement in proportions and details.

The column of the Doric order presents a tapering shaft resting upon the stylobate or platform. The shaft generally consisted of several parts called drums but in rare instances it was monolithic. It was grooved with semi-elliptical channels meeting in a sharp edge or arris. Surmounting the shaft the capital consisted of a circular cushion or echinus, so named from the sea-egg from which its curve was derived, and a square flat stone called the abacus. The capital formed the support for the entablature, comprising the architrave, frieze and the cornice. The architrave or epistyle was the first series of horizontal stones, usually unorn-

namented, and forming a solid basis for the frieze above, which was divided by alternating parts called triglyphs and metopes. The triglyphs were blocks, slightly projecting, carved with two vertical grooves and chamfered edges. These, save the two end ones, were placed above the centre of the columns and in the space midway between. The metopes were intervening square panels, often carved with architectural sculpture. Resting on the frieze was the cornice, consisting of a series of projecting moldings, the under side of the bed-molding being ornamented with square mutules having each 18 guttæ depending from its under side. The gutter molding above protected the sculptured metopes from water.

The Ionic order, a development of the 5th century B.C., was characterized by greater slenderness of proportion. The shaft was placed upon a base composed of one concave and two convex moldings of semi-circular profile; these in turn sometimes rested upon a square base block or plinth. The fluting of the shaft was semi-circular, consequently deeper than the Doric, and was separated by fillets. The capital comprised a bead, an echinus and an upper and characteristic band ending on both sides in a volute or scroll. The entablature was formed by an architrave of two or three flat faces and a frieze without triglyphs. The superimposed molding introduced a new feature in the row of narrow blocks or dentals under the corona.

The Corinthian order was a late development of the Ionic, resembling it in base and shaft, but differing in the form of the capital, which was ornamented with circlets of acanthus leaves surmounted by branching scrolls meeting at the corners in spiral volutes.

These three orders were invented by the Greeks, but were appropriated by the Romans who modified them in certain unessential details into types that pass as Roman Doric, Roman Ionic and Roman Corinthian. The latter, however, was the favorite order of Roman architecture. To the Romans belong, in addition, two other orders; the Tuscan, resembling the Doric, but without flutings in the column or triglyphs in the cornice; and the Composite, whose capital consisted of volutes modified from the Ionic and a lower circle of acanthus leaves derived from the Corinthian. This order admitted a great variety of ornamentation.

ORDERS IN COUNCIL, orders issued by the English sovereign in accordance with the advice of the Privy Council, a body which has no legislative power, excepting so far as Parliament may grant it. In times of emergency, however, the Privy Council has issued orders of a legislative character. Those instrumental in issuing such orders or carrying them out are generally relieved from all liability by a subsequent act of indemnity. It was by orders in council that Napoleon's famous continental system was met. See **CONTINENTAL SYSTEM**; **BERLIN DECREE**.

ORDERS (ROYAL) AND DECORATIONS. The love of personal decoration is one of the fundamental instincts of human nature. Carlyle observes in 'Sartor Resartus' that "among wild people we find tattooing and painting even prior to Clothes. The first spiritual want of a barbarous man is Decoration,

as indeed we still see among the barbarous classes in civilized countries." The ambition to wear some mark that shall distinguish the bearer among his fellows is perhaps as strong to-day as it was in the romantic period of chivalry from which practically all the more venerable orders and decorations of Europe took their rise. Yet in this respect, as in so many others, Europe merely borrowed from the East, for though there may have been no regular institution of knighthood or orders as we understand the terms, among the nations of antiquity, nevertheless the same law of honorary selection was recognized among the Egyptians, Assyrians and Persians. In the old days, including those of Greece and Rome, rings, gold chains, belts, "triumphal gifts," etc., conferred a distinction on personal merit, as discriminated from official rank and hereditary nobility, and were common to all classes. Furthermore, there are many Oriental titles that seem to illustrate the same general connection of ideas, as, for instance, the badges of great Japanese families, which bear a striking resemblance to the heraldry of Europe, while the peculiar and distinguishing marks of the various grades of the Chinese aristocracy, the so-called "buttons," are analogous to the "pearls" that adorn the coronets of the hereditary nobility of the West. It is supposed that among the prehistoric Pelasgians a "sash" indicated the same distinction as the torques and golden chains or collars of the Gauls, Celts and Teutons. Coming to later centuries, even our own times, we find that ribbons, chains and jeweled badges convey similar evidences of distinction and that the privilege of wearing them is still highly prized. Notwithstanding the fact that orders and decorations are frequently ridiculed by democratic peoples as "mediæval relics of monarchy" and denounced as "obsolete grewwaws of vanity," it is interesting to note how firmly that alleged "antiquated custom" has taken root in other guises in the greatest of all democracies—the United States. We may call it habit, fashion or human nature. Just as the two buttons on the back of a man's coat are a reminiscence of the civilian sword belt, so the wearing of innumerable "badges" in everyday life is in reality a survival—or revival—of the time-honored system of orders and decorations, an outward expression of the inherent desire for such distinctions. All kinds of associations have their badges, which their respective members proudly expose on their coat-lapels or watch-chains. The European War especially gave occasion for the exhibition in public of many and varied decorations, conferred by authority or self-adopted. In a class apart, soldiers and marines display their medals, crosses and chevrons indicating active service, conspicuous gallantry or wounds. Among civilians, the golden star on the service flag at home is a true decoration of honor; the purchaser of Liberty Bonds wore his decoration; the little Red Cross badge denoted that the wearer had subscribed to that beneficent institution; the college student wears the badge of his Greek letter society; the trade unions, clubs, boys' and girls' schools, etc., have their distinctive badges. Examples of this type could be multiplied *ad infinitum*; they serve to illustrate that decorations, as such, are by no

means despised. So far from being a modern invention or of recent development, the fundamentals of this remarkable manifestation lie buried in antiquity. It is safe to assume that if the wearers of these multifarious decorations did not regard them as honors, they would not so willingly exhibit them on their persons, for a decoration is essentially a reward for service rendered to a cause or a community. That a money gift can be no substitute for a decoration of honor is exemplified by the reverence with which the orders and medals of ancestors are treasured as family heirlooms: their value and glory only appreciate with time. While it is undoubtedly true that in Europe high decorations are frequently conferred as acknowledgments rather of social position than special merit, it has become a custom during comparatively recent years to affiliate to nobility the most distinguished among the aristocracy of art, science, literature, music and philanthropy, thereby honoring those who have largely contributed to human progress. For many centuries the highest honors were reserved exclusively for the profession of arms; there was literally no limit to the rank to which a successful warrior might not aspire, from knight to emperor. Carlyle satirized this exclusiveness so long ago as 1833, when he looked forward to the day when "communities discover, not without surprise, that fashioning the souls of a generation by Knowledge (i.e., teaching) can rank on a level with blowing their bodies to pieces by Gunpowder." Not reckoning Switzerland, the United States appears to be the only great country wherein the services of civilians, however meritorious, pass unrewarded, except for the Gold and Silver life-saving medals issued by the Treasury Department; decorations are conferred only on the army, navy, police and fire departments. France has her Academy of "Forty Immortals" and the Legion of Honor; Great Britain the Order of Merit and various other decorations for civilians; the Swedish Nobel Prize is international in its scope and has been awarded to several Americans, including the late President Roosevelt.

From a purely sentimental point of view, decorations possess a value that cannot be computed in terms of cash; money cannot buy true honors—they must be earned. It was the recognition of this sentiment that influenced Napoleon in the institution of the "Arms of Honor." In vain did old republicans, jealous of their new prerogatives, protest against the reintroduction of such "baubles" as unworthy of the citizens of a new republic. The consul, however, was not to be dissuaded. "You call them toys?" he answered, "Well, learn that it is through such toys that men are led!"

A distinction must be drawn between the "knights" of ancient Rome and the mediæval institution of chivalry; the former represented a class with variable rank, whereas the knight of chivalry preserved his distinction as such, even on the throne. There were also many other differences which distinguished the almost sacerdotal character of the latter from the simple social grade of the former. Yet the Roman equestrians may in some respects have formed the model on which the Chivalric Order was founded. That order may be described as

of two kinds, the religious, or hierarchical, and the secular or military. The two classes of organized and duly constituted bodies of knighthood are: (1) the associations or fraternities possessing property and rights of their own as independent bodies, and (2) honorary associations established for specified purposes by sovereigns within their respective dominions. To the former belong the three great religious orders created during the Crusades, the Templars, the Hospitallers and the Teutonic Knights. (See *ORDERS, RELIGIOUS*). While the strictly religious orders are now comparatively extinct, the more secular orders which they inspired exist under almost every flag, though it is not improbable that many will automatically become obsolete owing to the dynastic upheavals following the European War.

The Knights Hospitallers of Saint John the Baptist in Jerusalem, afterward known as the Order of Saint John of Malta, formed the most powerful of all the religious orders, originating about the middle of the 11th century by the erection of a hospital on the spot where, according to tradition, the "Last Supper" had been held. The founders were Italians. The Pilgrims of the hospital were constituted knights by Baldwin I in 1104 and their rule was confirmed by Pope Pascal II in 1113. Driven from Jerusalem, and afterward from place to place by the martial vicissitudes of the times, they finally seized upon the island of Rhodes, which they retained until 1522, when, upon being expelled, they went to Malta, which, with Gozo and Tripoli, was granted to them in fee by Emperor Charles V in 1530. During the period of the Reformation, as well as in subsequent years, the Order was abolished in some portions of the country, and, in 1798, having been dispossessed from Malta by Napoleon, the Knights settled in the papal states, from which headquarters the Order has been to some extent revived. Originally the Order maintained a class for women, "The Ladies of the Order of Saint John," which was founded by Agnes, abbess of the house of Saint Mary Magdalen, in 1099. So recently as February 1918 the Roman civil courts decided a lawsuit involving property vested in the Knights of Malta which had been wrongly held for 100 years.

The Order of the Holy Sepulchre was one of the most ancient of the early fraternities. Though attributed to Saint Helena, it is believed to have been instituted by Baldwin I, king of Jerusalem, about A.D. 1110. As originally founded it was restricted to the priesthood and this restriction was not removed until 1484, when Pope Innocent VIII incorporated it with the Order of the Knights of Saint John of Jerusalem. Two ineffectual attempts were made to sever the bond of union, but in 1496 Pope Alexander VI, who took so much interest in the Order that he may almost be regarded as its real founder, transferred the power of admitting knights to the Holy See, and, from that time, the Order was changed from a religious association to a fraternity of chivalric character.

The Templars originated about 1120, under Baldwin II, when nine gentlemen and two nobles appeared as Pilgrims at Jerusalem. Adopting the rule of Saint Augustine they took up their abode in the Holy City, and gradually extended their influence until they became one

of the most powerful confraternities, under the name of "Brethren of the Militia of the Temple." In an evil hour, however, they incurred the animosity of Philip le Bel and of Pope Clement V, and, in the year 1312, the latter announced the suppression of the Order in France. Although it is still doubtful whether the action of Pope Clement was just or unjust, his example was followed by the whole of Europe, and the final blow was struck when the last grand master, Jacques de Molay (q.v.), was executed at the stake, in France, in 1313. The Order has never been revived.

The Teutonic Order, the last of the great religious fraternities, was founded at Acre in 1190. Prior to its organization German pilgrims had received scant attention at the Holy City. Needy pilgrims from France and Italy found the Templars and the Hospitallers ready to receive them, so this new Order was formed with the object of attending to sick and wounded Germans. In 1191 Frederick of Swabia gave the Order a constitution which established the rule of Saint Augustine and adopted regulations governing the practice of all duties. Regarding the treatment of the sick and the poor the regulations were similar to those of the Knights of Saint John, while the regulations respecting peace and war were identical with those of the Templars. With the sanction of Pope Celestine III, Frederick gave the association the name of "The Order of the German House of the Holy Virgin at Jerusalem." The Order attained the height of its power in the 13th century, but this period of luxury was followed by one of anarchy. In the 15th century, after the Twelve-Years' War, it became feudatory to Poland. The original Order was abolished after the Peace of Cracow 1525, and its territories handed as fief of Poland to the Grand Master Albert, Margrave of Brandenburg, who took the title of "Administrator in Prussia and Grand Master of the Teutonic Order in Germany." With various interruptions this condition existed till 1805, when the dignity was vested in the emperor of Austria. Napoleon abolished the Order in the Rhenish province in 1809 and apportioned all its lands among the neighboring princes. The Congress of Vienna restored most of the property and in 1840 it was declared an independent fief of the Austrian Empire.

At the head of the great secular orders which still maintain their pristine reputation stands the British Order of the Garter. Next in rank and antiquity is the Order of the Golden Fleece, which was not only the most important order of the Austrian Empire, but is also the principal decoration of the Spanish Crown. Founded in 1429 by Duke Philip of Burgundy, the grand mastership was held by his house until Charles the Bold died without male issue in 1477, when it passed to his son-in-law the Emperor Maximilian of Germany. When the Hapsburg rule ceased in Spain at the beginning of the 18th century, the Golden Fleece became the subject of a violent quarrel. Spain and Austria each claimed the order, with the result that both countries retained it.

The third of the great mediæval orders is that of the most sacred Annunziata, the principal order of Italy, founded in 1362 by Amadeo of Savoy. Called by Favin, "the Order of the Snares of Love," and known at various periods

- 1 ORDER OF CHRIST (Portugal).
- 2 SOCIETY OF THE CINCINNATI (United States).
- 3 ORDER OF THE THISTLE, with Collar Attachment (Great Britain, Scotland).
- 4 ORDER OF THE GARTER, with Collar Attachment (Great Britain).
- 5 ORDER OF ST. GREGORY THE GREAT (Pontifical).
- 6 ORDER OF THE GOLDEN FLEECE (Spain).

- 7 GUELPHIC ORDER OF HANOVER.
- 8 ORDER OF THE BATH, Military Class (Great Britain).
- 9 GRAND ARMY OF THE REPUBLIC (United States).
- 10 ORDER OF ST. MICHAEL AND ST. GEORGE (Great Britain).
- 11 ORDER OF THE ROSE (Prussia).

13 ORDER OF THE HOLY GHOST (France).

14 ORDER OF THE TOWER AND SWORD (Portugal).

15 ORDER OF THE HOLY SEPULCHRE (Pontifical).

16 LEGION OF HONOR (France).

17 LOYAL LEGION (United States).

18 ORDER OF THE STAR OF INDIA (England, India).

19 ORDER OF ST. ANDREW (Russia).

as "the Collar" and "Loveknots," for the reasons for which one must turn to tradition, its importance is indicated by the fact, that its chevaliers are styled "cousins of the King," all of whom, with their wives, participate in the honor of this relationship to royalty.

The only insignia of distinction ever authorized by the Congress of the United States are the medals of honor for exceptional bravery in war and for life saving, which from time to time have been sanctioned by the government. France, too, continues to show a distaste to chivalric orders and remains satisfied with its republican decoration, the Legion of Honor, which, however, is not so closely restricted as are the awards of honor made by the United States.

The following list with dates of institution shows the principal orders and other decorations existing in the various countries. With the collapse of the Russian Empire in 1917 and the introduction of republican forms of government in the German and Austro-Hungarian empires at the close of 1918, the data shown under those countries may possess only a historical interest:

ABYSSINIA.—The Order of Solomon's Seals or Order of Saint George (1874); Order of the Star.

AUSTRIA-HUNGARY.—The Order of the Golden Fleece, the wearers of which took precedence over all others at court functions; the military Order of Maria-Theresa (1757); the Order of Saint Stephen of Hungary (1767) for civil merit; the Order of the Iron Cross, founded by Napoleon in 1805, was extinguished in 1814 but re-established in 1816 by the Emperor Francis I as an Austrian order; the Order of Leopold (1808), a distinction for personal merit; the Order of Francis Joseph, for distinguished merit in all classes (1849); the Military Foundation of Elizabeth Theresa, rejuvenated in 1771; and two decorations for women, the Order of the Starry Cross (1668) and the Order of Elizabeth (1898). The Cross of Merit for officers (1849) and for ordinary soldiers (1801); the Medal of Honor of Austria-Hungary (1877) was bestowed upon those who excelled in the arts and sciences; and the Souvenir Medal of the Jubilee (1898), a civilian decoration.

BELGIUM.—The Order of Leopold, civil and military (1832); the Order of the Iron Cross, a civil decoration (1867), took its rise from the Order of Civil Merit instituted in 1830; and the Military Cross of two classes (1885).

BOLIVIA.—The Order of the Cross of Christopher Columbus, of which there are three classes, is no longer conferred.

BRAZIL.—The constitution of 1891 suppressed all decorations except two medals of merit. The extinct orders were the Imperial Order of the Southern Cross (1822), the Order of Pedro I (1826), the Imperial Order of the Rose (1829), the Order of Christopher Columbus (1890) and the Medal of Merit (1889).

BULGARIA.—The Military Order of Bulgaria (1879) includes a grand cross and four classes each for officers and private soldiers; the Order of Alexander, to which is added the Medal of Merit (1881); the Civil Merit Order (1891) is for distinction in the arts and sciences, and the Military Cross is awarded for 20 years' service.

CHINA.—The only order bestowed under the Empire was that of the Imperial Dragon (1862). After 1882 it became the Order of the Double Dragon, divided into five classes.

DENMARK.—The Order of the Elephant is so ancient that its origin is lost in tradition. Originally a religious society, it was re-organized in 1693 and received its present name. The Order of the Dannebrog, which is conferred only upon natives, is also of great antiquity; it is said to have been founded by Waldemar II in 1219 in commemoration of a miraculous intervention in battle. In 1808 it was changed from a court honor to an honor of merit. Denmark also bestows medals for lifesavings, military service and inventions.

FRANCE.—In addition to the Order of the Legion of Honor, which was founded by Napoleon 19 May 1802, France has the following medals of decoration: The Military Medal, founded by Napoleon III; the Medal of Honor, founded by President McMahon; the Medal of Merit, founded by President Grévy; the Colonial Medal, founded in 1893 for military services in the colonies and countries under French protection; the Medal of Honor, created by decree in 1897; the bronze Medal of Reward for bravery in the performance of duty, founded in 1899, and the Medal of Honor in silver, for commercial workmen, founded by decree in 1900. The highly-prized Croix de Guerre was created for the European War, as was also the Medal of French Gratitude (1916),

awarded to those who have aided wounded men, the sick, the families of killed or those driven from their homes by invasion.

GERMANY.—There were numerous orders and decorations in the former German Empire, every kingdom, principality and duchy of the Reich possessing its own distinctions. In Prussia, the Order of the Black Eagle (1701) was one of the most important; the Order of the Red Eagle (1705) was organized in 1712 as an order of the House of Hohenzollern; the Order of Civil and Military Merit dates back to 1667, was reorganized in 1840 as the Order for Merit and was later extended to the civil class for arts and science, to include 30 Germans and an equal number of foreigners. The "Ordre Pour le Merite" was the highest military service medal within the gift of the Emperor. The Royal Order of the House of Hohenzollern (1841); the Order of the Crown of Prussia (1901); the Royal Order of the Crown (1861); the Order of the Iron Cross originated in 1813, and the Order of William (Wilhelms-Orden) was founded by the last Kaiser in 1896. The Order of Louise, for women's service in war, was founded in 1814, and the Cross of Merit for women was created in 1871. There were other decorations for benevolence, Red Cross, etc.

GREAT BRITAIN.—The highest distinction is the Most Noble Order of the Garter, established by King Edward III in 1348. It is now limited to the sovereign and such other descendants of George I as may be elected and to 25 Knights Companions; but sovereigns and princes of other countries, and extra Knights Companions, may be admitted by special statutes. Its abbreviation is "K.G.", and it is the highest order of knighthood. Its insignia and habit include the George—a gold medallion of Saint George and the Dragon, suspended from a blue ribbon; the Garter, which is worn below the knee of the left leg, and is made of dark blue velvet edged with gold, bearing the motto, *Honi soit qui mal y pense* ("Evil be to him who evil thinks"); a mantle of blue velvet lined with taffeta, with the star of the order embroidered on the left breast; a hood and surcoat of crimson velvet and a hat of black velvet; a gold collar weighing 30 ounces, and the star with the cross of Saint George in the centre, encircled by the Garter. The reigning Queen is Lady of the Order.

The Most Ancient and Most Noble Order of the Thistle dates to 1540, was remodelled in 1687 and again in 1703. The order consists of the King and 16 knights. Its abbreviation is K.T., and the badge, the gold Saint Andrew, is suspended from a green ribbon; its motto is, *Nemo me impune lacessit*.

The Most Illustrious Order of Saint Patrick was created in 1783 and revised in 1905. It consists of the King, a Grand Master, who is the Lord-Lieutenant of Ireland for the time being, and 22 knights. Its abbreviation is K.P., its badge, on a sky-blue ribbon, bears the motto, *Quis separabit?*

The Most Honorable Order of the Bath was originally established by King Henry IV in 1399. It fell into neglect during the 17th century but was revived in 1725. Remodelled in 1815 and enlarged in 1845, it is now divided into three classes—Knight Grand Cross (A.C.B.), Knight Commander (K.C.B.) and Companion (C.B.). Exclusive of the King and princes of the blood, the first class is limited to 57 members for military service and 27 for civil service, besides distinguished foreigners who may be awarded the honorary degree. The second class is limited to 150 for military and 114 for civil service; while the third, the Companions, may number 1,056, of whom 732 may be for military and 324 for civil service. The badge, suspended from a crimson ribbon, bears the motto, *Tria juncta in uno*.

The Most Distinguished Order of Saint Michael and Saint George was created in 1818 and is generally bestowed on those who have rendered meritorious service in colonial or foreign affairs. Its motto is *Auspiciis melioris avi*; it is divided into three classes, Knight Grand Cross (G.C.M.G.), Knight Commander (K.C.M.G.) and Companion (C.M.G.); the first class is limited to 100 members, the second to 300, and the third to 725.

The Most Exalted Order of the Star of India was established in 1861 and frequently enlarged until 1911. Bestowed for services rendered to the Indian Empire, the badge bears the motto, *Heaven's Light our Guide*. It has three classes, Knight Grand Commander (G.C.S.I.), Knight Commander (K.C.S.I.) and Companion (C.S.I.), and is limited to the sovereign, a Grand Master (the Viceroy of India for the time being) and 44 members of the first class, 100 of the second and 200 of the third.

The Most Eminent Order of the Indian Empire (1877) is similarly bestowed as the foregoing order; it has also three classes but is less limited in number of membership. The abbreviations are, G.C.I.E., K.C.I.E. and C.I.E.

The Royal Victoria Order, founded by Queen Victoria in 1896, is restricted to British subjects who have rendered meritorious personal services to the sovereign; when conferred upon foreigners it is an honorary rank. There are five classes, G.C.V.O., K.C.V.O., C.V.O. and M.V.O. for the fourth and fifth classes.

The Order of the British Empire, created by King George in 1917, consists of five classes each for men and women, conferred for services rendered to the Empire at home or abroad.

The Order of Merit, established by King Edward VII in

1902, is bestowed for conspicuous distinction in army, navy, government, art, science, literature, music, etc. The late Miss Florence Nightingale was one of the recipients of this order.

The Order of the Companions of Honour, founded by King George 21 June 1917, consists of one class, to which both men and women are eligible, and is closely limited as to number of recipients. It is a very special distinction.

The Distinguished Service Order (D.S.O.) was created by Queen Victoria as a reward for officers in the army and navy. Foreign officers who have been associated in naval and military operations with the British are eligible as honorary members.

The Imperial Service Order (1902) is a decoration for members of the Civil Service of the Empire. No others are eligible. Women are included. Companions of the order add I.S.O. after their names.

The Imperial Order of the Crown of India (1877) is limited to those who have held office under the Indian government; it includes native princes with their wives and other female relatives.

The Order of the Hospital of Saint John of Jerusalem in England is a modern creation dating from 1888. It concerns itself with hospital, ambulance and other charitable works, consists of Knights and Ladies of Justice, Chaplains, Knights and Ladies of Grace and Esquires. Appointments to this order carry no rank nor title.

The Victoria Cross, the most highly-prized of all British awards, is dealt with elsewhere. (See VICTORIA CROSS). The following decorations were created during the European War: The Military Cross (1915), conferred on captains, commissioned officers of a lower grade and Indian and Colonial military forces. The Military Medal (1916), conferred on non-commissioned officers and men and women "for individual or associated acts of bravery on the recommendation of a commander-in-chief on the field." The Distinguished Service Cross (formerly the Conspicuous Service Cross) was renamed in 1915 for "distinguished service before the enemy," and extends to all naval officers below the rank of lieutenant-commander. The Distinguished Service Medal (1915) is a naval decoration.

The Albert Medal (1866) is a reward for acts of heroism performed by civilians at sea or on land. There are two grades—gold and bronze. The Edward Medal (1907) is awarded for heroism in life-saving in industrial employment. The Kaisar-i-Hind Medal (1900) is bestowed for services rendered in India, without distinction of race or sex.

GREECE.—The Royal Order of the Redeemer, founded by the General Assembly of the Hellenes in 1829, is conferred for both military and civil distinctions.

HAWAII.—The orders formerly existing but now no longer conferred were the Order of Kamehameha I (1865), the Order of Kalakaua I (1875), the Order of the Royal Crown of Hawaii (1882), an Order and a Medal of Kapiolani (1880) and the Order of the Star of the Ocean (1866).

ITALY.—The Order of the Annunziata, already referred to, consists of but one grade. It was revived by Charles III in 1815 and again modified by Victor Emmanuel II in 1869, who restricted the number of knights to 20 in addition to the sovereign, the princes and some others. The Order of Saint Maurice and Saint Lazare was formed by uniting two orders, the first dating back to 1434 and the latter, it is said, to the 10th century. New statutes were made in 1816 and limitations withdrawn. Other Italian orders are the military Order of Savoy (1815), the Civil Order of Savoy (1831), the Order of the Crown of Italy (1868) and the Order of Agricultural Merit (1901).

JAPAN.—The Supreme Order of the Chrysanthemum (1877) is conferred almost exclusively upon princes of the blood and foreign sovereigns; the Order of the Sun of Paulownia (1888) and the Eastern Sun (1875); the Military Order of the Golden Kite (1890), the Order of the Sacred Treasure (1888), the Order of the Crown, for women (1888) and the Medal for life-saving (1881).

LIBERIA.—The Order of the Beneficence of Liberia (1879); the Gold Medal of the Lone Star and the Order of Merit, bestowed for service in the civilization of Africa.

LUXEMBURG.—The Order of the Golden Lion of the House of Nassau (1858); the Order of the Oaken Crown (1849) and an order of Civil and Military Merit.

MEXICO.—The Mexican orders no longer conferred were the Order of Our Lady of Guadalupe (1852); the Order of the Mexican Eagle (1865), a Medal for Bravery and the Order of Saint Charles, for women (1865).

MONACO.—The Order of Saint Charles (1858).

MONTENEGRO.—The Order of Independence (1855); the Order of Saint Peter (1851); a gold Medal for Bravery (1841) and a Medal of Devotion for patriotic service (1895).

NETHERLANDS.—The Order of Willem (1815) is a military distinction, and the Order of the Netherlands Lion (1815) is a recompense for civil merit. The Order of Orang-Nassau (1892); the Teutonic Order, the Commandery of Utrecht and the Order of the Golden Lion.

PERSIA.—The Order of the Sun and the Lion (1808); the Order of the Sun, for women (1873), and a Medal for the arts and sciences (1851).

PONTIFICAL.—Several orders of importance are still con-

ferred by the Holy See. The doubtful Order of the Golden Spur, now the Order of Saint Sylvester, claims greater antiquity than any other Knightly Order on the presumption that it was instituted by Constantine the Great and confirmed by Saint Sylvester. Many reliable authorities, however, attribute its origin to Pope Pius IV in 1559. On 31 Oct. 1841 Pope Gregory XVI decreed new statutes restricting its applications to zeal in the cause of the church and civil virtues and dividing it into two classes, Commanders and Knights. The Order of the Holy Sepulchre, which is attributed to Pope Alexander VI and Godfrey of Bouillon was created with about the same motives as the Order of Saint John of Jerusalem. It was confirmed by Pope Benedict XIV in 1746, and the decorations of its three classes are now conferred in the name of the Holy See by the Latin Patriarch at Jerusalem. The Order of Christ as conferred at Rome closely resembles the Portuguese order of the same name. In Rome, however, noble birth is not a requisite to admission. Other Pontifical orders are the Order of Pius IX, founded by Pope Pius IX 17 June 1847; the Order of Saint Gregory the Great, founded by Gregory XVI 1 Sept. 1831; the Order of the Moor, an art distinction, founded by Pope Pius VII 23 Sept. 1806; and the Order of Saint Cecilia, a musical distinction, founded 17 June 1847. The Golden Rose is sent occasionally to high dignitaries, and sometimes to cities or churches, in recognition of high type of character. It originated in the 13th century, and of late years it has been bestowed chiefly upon women of royal blood.

RUMANIA.—The Order of the Star of Rumania (1877); the Order of the Crown of Rumania (1881); a Medal of Military Virtue (1872); a Medal of Merit for arts and sciences (1876) and a Medal for faithful service (1878).

RUSSIA.—Under the old régime the conferring of an order by the Tsar carried with it a patent of nobility. The most important were the Order of Saint Andrew (1698); the Order of Saint Catherine, for women (1714); Order of Saint Alexander-Nevski (1725); Military Order of Saint George (1769); Order of Saint Vladimir (1782); Order of Saint Anne (1735); three Polish decorations: Order of the White Eagle; Order of Saint Stanislas and the Order of Military Merit.

SAN MARINO.—The chivalric Order of San Marino (1860).

SERBIA.—The Order of Saint Lazare; Order of the White Eagle (1883); Order of the Cross of Takovo (1865); Order of Saint Sava (1883) and Order of Milosh the Great (1898). New military decorations were created during the European War.

SIAM.—The Order of the Nine-Pointed Star (1869) is a religious decoration conferred only upon Buddhists; Order of the Great Crown (1884) is conferred only on royalties; Order of the White Elephant of Siam (1861) is the highest national honor; Order of the Siamese Crown (1869) and a Sacred Order containing a portrait of the king.

SPAIN.—In addition to the Golden Fleece, which Spain shared with the former Austrian Empire, and the Military Order of Malta, which is the Spanish branch of the Order of Saint John of Jerusalem, Spain has several ancient decorations. Chief among these are the Military Order of Calatrava (1158); the Military Order of Saint Ferdinand (1811); the Military Order of Our Lady of Montesa (1319); the Military Order of Saint Hermenegilde (1814); the Royal American Order of Isabella the Catholic (1815); the Order Isabella II (1833); the Illustrious Royal Order of Charles III (1771); the Order of Military Merit (1866); Order of Marie-Victoria (1871); Order of the Beneficencia, for humane and useful public service (1856); Military Order of Marie-Christine (1890) and the Order of Marie-Louise, for women only (1792).

SWEDEN AND NORWAY.—Sweden possesses the only Masonic order in the world, the Order of Charles XIII. founded by that monarch in 1811. It is bestowed only upon Freemasons of high rank. The late King Edward VII, as Grand Master of England, was a member of this order. The Order of the Seraphim dates from the 13th century; the Order of the Sword, or the Yellow Ribbon, originated in 1522; while the Order of the Pole Star was founded in 1748. Since the separation of the two kingdoms of Sweden and Norway in 1905 the orders remained with Sweden.

TURKEY.—The principal Turkish orders are those of the Medjidieh (1851); the Nishan-i-Shefkat (1878), for women, and the Osmanieh, for distinguished civil or military service (1862). There are several minor Turkish decorations.

VENEZUELA.—The Order of Bolivar (1825); Order of Merit (1861) and a Medal of Public Instruction.

ZANZIBAR.—The Order of the Jeweled Star (1875) is the only decoration issued by the Sultan of this British protectorate.

HENRI KLEIN,

Editorial Staff of The Americana.

ORDINAL, that portion of the Anglican Book of Common Prayer (q.v.) which contains the offices for the consecration of bishops and the ordination of priests and deacons. So far it corresponds with certain offices in the Pontifical of the Roman Catholic Church. A. commission appointed by the Crown in the year 1550, with the approval of parliament, prepared the original form which was amended two years later and again in 1562. Since the former date (1552) the Anglican Ordinal always appears under one cover with the Book of Common Prayer. The American Ordinal dates from 1792. Consult Proctor and Frere, 'A New History of the Book of Common Prayer' (London 1905).

ORDINANCE, (1) a law or order of a municipal governing body. (2) In England, an order or regulation issued by a power inferior to the sovereign. (3) Formerly, in England, a species of legislation issued by the sovereign, but not sanctioned by Parliament. In the United States the term is almost unknown in any sense except definition one, although in England the term by-law is used with this meaning. It has been held (99 Pa. 330) that a resolution of a council is but another name for an ordinance, and if it is a legislative act it is immaterial whether it is called a resolution or an ordinance, so long as the requirements essential to the validity of an ordinance be observed.

ORDINANCE OF 1784. See BOUNDARIES OF THE UNITED STATES.

ORDINANCE OF 1787, in American history, an act of Congress passed in July 1787, to regulate the government of the western lands granted to the Ohio Company. The ordinance has been called "the most notable law ever enacted by the representatives of the American people." It marks the beginning of one of the most remarkable growths ever known in territorial expansion, and it has furnished the bases for the constitutions of several States. It is especially noted for three great provisions of all good government, its guaranty of entire freedom of worship, its perpetual prohibition of human slavery and the great prominence given to the matter of schools and education in the words "Religion, morality and knowledge being necessary to good government and the happiness of mankind, schools and the means of education shall forever be encouraged." The "Ordinance of 1787" says: "Be it ordained by the United States in Congress assembled that said territory, for the purposes of temporary government, be one district, subject, however, to be divided into two districts, as future circumstances may, in the opinion of Congress, make it expedient." This declaration is followed by 13 other sections, the first 12 of which provide for the management of affairs under a temporary government of the Northwest Territory. The purpose of this paper is set forth as follows:

"And, for extending the fundamental principles of civil and religious liberty, which form the basis whereon these republics, their laws and constitutions, are erected to fix and establish these principles as the basis of all laws, constitutions, and governments, which forever hereafter shall be formed in said territory to provide also for the establishment of states, and permanent government therein, and for

their admission to a share in the federal councils on an equal footing with the original states, at as early periods as may be consistent with the general interest:—It is hereby ordained and declared by the authority aforesaid (United States), That the articles shall be considered as articles of compact between the original states and the people and states in the said territory and forever remain unalterable, unless by common consent."

The articles referred to are six in number and form a definite compact between the United States as it then existed and the people of the Northwest Territory and the States that might afterward be formed from it. See **BOUNDARIES OF THE UNITED STATES**.

ORDINANCE POWER. See **MUNICIPALITIES**.

ORDINATION, the ceremony by which bishops, priests and deacons, candidates for the minor orders and ministers of any denomination are admitted to their specific office in the church. The Roman Catholic doctrine of ordination is confirmed by John xx, 21, 22, and the power of ordination is believed to be descended from the apostles through the bishops. Ordination is reckoned one of the seven sacraments of the Catholic Church. Orders in the Roman Catholic Church are normally conferred by bishops and the higher orders can be conferred by no other functionary. Holy orders are conferred normally on the Saturdays in any of the four Ember weeks, on the fifth Saturday in Lent, on Holy Saturday; but two grades cannot be conferred the same day on the same person. A bishop is normally ordained on a Sunday or on the festival of an apostle. The English Church also considers ordination as a real consecration, the power of communicating which has descended from Christ through the apostles and bishops. (See **APOSTOLIC SUCCESSION**). There is, however, a diversity of opinion on this point, the high-church party maintaining the dogma, the broad and some of the low-church party denying it. For ordination in the English Church subscription to the 39 articles and the declaration that the Book of Common Prayer contains nothing contrary to Scripture are required. The ceremony of ordination is performed by the bishop with the imposition of hands on the person to be ordained. In the English Church ordination is a requisite to the exercise of a ministerial office; but in some denominations ordination is not necessary for that purpose. In the Presbyterian Church ordination means the act of settling or establishing a licensed preacher over a congregation, with pastoral charge and authority, or the act of conferring on a licensed preacher the powers of a settled minister of the gospel without the charge of a particular church, but with general power wherever he may be called upon to officiate. The Congregationalists believe that the call of a congregation gives ministerial authority to a preacher. In the Methodist Episcopal churches the form of ordination closely follows that of the Protestant Episcopal Church, with omission of every form of expression which may appear to favor sacerdotalism.

ORDNANCE (variant of ordinance, from Latin, *ordinare*, to order). The word owes its application to military machines to an ordinance of Henry VIII of England, regulating the manufacture of cannon, and establishing a board charged with the care of the Crown fortifications. In time cannon manufactured according

to the specifications of the decree came to be known as ordinance or ordnance. In its present usage, the term comprehends all machines designed to hurl projectiles of any kind, shape or size by the agency of explosives. More particularly, it is understood to refer to mounted cannon as distinguished from those pieces such as rifles, pistols or other small arms usually held in the hand while being fired. In the modern system the term "gun" has come into general use for all forms, regardless of their power or of the uses for which they are designed. Mounted cannon to-day includes very many types differing one from another according to the use for which they are intended. In this work many ordnance types are treated under their own heads. See **ARMOR PLATE**; **ARTILLERY**; **COAST DEFENSE**; **FORTIFICATIONS**; **GUNS, HISTORY AND DEVELOPMENT OF**; **GUNS, LAND**; **GUNS, NAVAL**; **GUNNERY**; **MACHINE GUN**; **SMALL ARMS**.

ORDNANCE, Department of, in the United States War Department, staff corps which superintends the design, production and supply of arms, ammunition and personal military equipment of the soldier and of certain other related military supplies. It is under the direction of the chief of ordnance and contains an establishment of 132 ordnance officers commissioned as such in the regular army, together with 30 officers detailed for instruction each year, reserve officers and enlisted men. The Ordnance Department has charge of all arsenals, ordnance depots and proving grounds. The employees at these are mostly civilians. See **UNITED STATES, ARMY OF THE**; **ARMY ORGANIZATION**.

ORDÓÑEZ DE MONTALVO, Garcí, Spanish writer, father of the novel of knightly adventure. He was born probably about the middle of the 15th century and he was very active at the close of it. He retold the old semi-mythological, semi-caballeresque stories of 'Amadís de Gaula,' recasting them in the Spanish of his day; and to the three books thus reformed he added a fourth which, it is generally conceded, was his own invention. The proofs of this are that the style, material and manner of treatment in the fourth volume are very different from those of the other three. A fifth book, 'Las Sergas de Espandián,' by Ordóñez de Montalvo, is a continuation of the Amadís stories. Ordóñez de Montalvo was a soldier who saw many wars and finally became governor of the city of Medina del Campo. But nothing is known of his life except such information as incidentally appears in his works. Even his birthplace is in doubt. He seems to have taken his original version of the 'Amadís' from the Portuguese, where the stories had long been popular; but in working it over to have added much from his own vivid imagination and experience. In the fifth book, already cited, he continues the series with the adventures of the son of Amadís. These Amadís stories of Ordóñez de Montalvo were immensely popular in their day and had countless imitators, not in Spain alone, but in all the Latin countries (more especially in France) and in England. They created a new and freer literature, imaginative and bombastic and generally untrue to human nature. Yet they formed the delight of Spanish readers for a whole cen-

tury; and they only disappeared with the breaking up of chivalry and before the ridicule of them so persistently carried out in 'Don Quixote.' Though the Amadis stories disappeared they left their broad trail on the succeeding literature of Europe; and 'Don Quixote' itself owes its form to the constructive ability shown in the work of Ordóñez de Montalvo. See CERVANTES; AMADIS DE GAULA; CHIVALRY.

ORDOVICIAN, ôr-dô-vîsh'ân, in geology, a term introduced in 1879 by Lapworth for what Murchison had called the Lower Silurian as early as 1835; the term Silurian being used thereafter for the most part only of the Upper Silurian in Murchison's nomenclature. Hence the Ordovician system may be defined as the rocks of the period after the Cambrian (q.v.) and before the Silurian (q.v.), the latter term being used in the sense explained above. The name Ordovician is derived from a Welsh tribe. The system in America has been variously subdivided. The following units are now generally recognized, Lower or Canadian, Middle or Mohawkian and Upper or Cincinnati. These names are not used in other countries. The Cambrian passed without notable change into the Ordovician. The period was one of shallow but widespread epicontinental seas with local emergences and erosion. The water areas reached a maximum near the middle of the period, when more of North America was under water than at any other known time in its history. Sandstones and shales were deposited in places, but it was notably a time of limestone formation, the Trenton being a very extensive limestone of mid-Ordovician age. In North America the period was brought to a close by folding disturbances which have been called the Taconic Revolution, producing a range of mountains on the present site of the Green Mountains. Simultaneous folding took place in the British Isles. This folding was accompanied by rather general emergence of eastern United States, and the Cincinnati Arch took form about this time. Wide spread outcrops of Ordovician rocks occur in the Appalachian Mountains, in southern Wisconsin, in the Ozarks and at many other points. In many places the rocks of the system lie deeply buried by younger sediments. Europe was also widely submerged in Ordovician time, and there was extensive volcanism in the British Isles. Much of the oil and gas of Ohio comes from rocks of Ordovician age.

The life of the Ordovician showed marked advance over that of the Cambrian. Brachio-pods and Trilobites were very abundant. The long straight Orthoceras type of Cephalopods became numerous and were the largest animals in the Ordovician seas, attaining to lengths of over 10 feet. Fish remains, the oldest vertebrates known, are doubtfully reported from Ordovician rocks. Evidences of plant life are very uncertain. See CANADIAN SERIES; CHAZY STAGE; CINCINNATI ANTICLINE; TRENTON STAGE, etc.

ORDWAY, John Morse, American educator and chemist; b. Amesbury, Mass., 23 April 1823; d. 3 July 1909. He was graduated from Dartmouth College in 1844 and engaged in chemical work. In 1847 he was superintendent of the Roxbury Color and Chemical Company's works at Roxbury, and in 1850 accepted a pro-

fessorship in Grand River College, Trenton, Mo. After 1854 he re-engaged in chemical work; in 1869 was appointed professor of industrial chemistry and metallurgy at the Massachusetts Institute of Technology, and in 1884 became a professor at Tulane University and its branch for women, Newcomb College.

ORE. An ore may be defined as any mineral or aggregation of minerals from which a metal or metals can be extracted at a profit. This definition is not exact, but is one often used by geologists and mining engineers. Since the prospect of profitable extraction is involved it follows that mineral containing a certain per cent of a metal may be considered an ore in one region and not an ore in another. Thus pyrrhotite containing 2 per cent copper would be called copper ore if situated where it could be worked to advantage, and would not be called a copper ore if situated, say, in Tibet. Again certain minerals formerly not considered as ores are not now, and other minerals not ores now will be considered such in the future. Bauxite is an ore of aluminum, but aluminum was not known a century ago. Similarly clay will be an ore of aluminum with the progress of metallurgy. Ores containing a relatively small proportion of the metal sought are termed lean or low grade, those containing a high per cent rich or high grade; the relative percentages depend on the value of the metal. Ore containing 1 per cent of gold would be extremely rich. In the Lake Superior country iron ores containing less than 50 per cent iron are low grade. Metals may be disseminated through a rock in the native state or as chemical compounds of sulphur, oxygen, carbonic acid, etc. Gold and silver, the noble metals, occur native as does copper. An ore carrying native gold is called free-milling. In general it may be said that nine-tenths of the commercially important ores are sulphides, oxides, hydroxides, carbonates and native metals. For information on methods of extracting metals from their ores see METALLURGY, also COPPER; GOLD; IRON, etc. For a discussion of methods of occurrence of ores see ORE DEPOSITS and ECONOMIC GEOLOGY.

ORE CRUSHING. See GOLD MINING.

ORE DEPOSITS. It is impossible to draw a fixed boundary between those occurrences of metalliferous minerals that are to be regarded as ore deposits and those that are not. Generally speaking an ore deposit is any occurrence of metalliferous minerals, large enough and rich enough to be worked at a profit. It thus appears that a body of mineral might be properly regarded as an ore deposit under some conditions and not under others. Magnetite, which in places is an important ore of iron, is often found scattered through granite, yet no one would regard a granite ledge as an iron ore deposit. The exact point at which rocks containing iron oxides become iron ore bodies is determined by the factor of cost of extraction. A ledge containing a small percentage of iron favorably situated might be profitably worked, whereas if situated in some remote locality it could not.

Whatever theory as to the origin of the earth may be held, it is certain that the useful metals were once original constituents of the rocks, either finely disseminated, or perhaps, as some

hold, concentrated as a heavier central core within the earth. In any case, these metals have been later concentrated into our present ore deposits, by a complex series of processes to be outlined very briefly below.

In a molten magma slowly cooling at great depths as the minerals crystallize out they may collect in aggregates, either from unequal cooling of the magma or from what we may call mineral attraction. It is fairly certain that bodies of chrome iron ore, of nickel-copper sulphides, of magnetite and possibly platinum have formed by cooling from fusion. The nickel deposits of Sudbury, Ontario, and much of the magnetic iron ore of the Adirondack region of New York are believed to be of this origin. The process by which these ores have been formed is known as magmatic segregation. Again supposing the minerals distributed thinly through a cooled magma—an igneous rock—they may be concentrated into workable ore bodies, (1) by the decay of the rock when, after overlying strata have been uplifted and eroded, its constituent minerals are broken up and removed by air and water and only the more resistant are left. Thus are formed the so-called *placer* deposits, whence has come much of the world's supply of gold, also the principal tin deposits. The minerals removed in suspension or solution in surface water and the contained metals may be precipitated chemically, or by some form of organic life. Thus have beds containing various iron compounds been formed, the bog iron ores, and those carbonates and silicates which after partial solution and leaching out of silica are now represented by the Lake Superior iron ore deposits.

Slowly circulating meteoric waters in their passage through the rocks may take into solution metallic compounds which they encounter, and may deposit them in fissures as veins, or in irregular shaped caves as large masses of ore. Sometimes the waters slowly dissolve away limestone and replace it particle by particle with metallic minerals forming what are known as replacement deposits. Such is the origin of the well-known lead and zinc deposits of Missouri and Wisconsin.

In regions of igneous activity, particularly in mountainous areas, large masses of molten rock (magma) force their way into the adjacent rocks. These contain much water (magmatic water) which they give off as they cool and solidify, and this water sometimes carries away with it in solution metallic compounds. As the waters rise toward the surface along fractures they cool and deposit much of their load as veins. By replacing the wall rock they may also form large irregular replacement deposits. Many of the great gold, silver and copper deposits of western United States have been thus formed by hot waters of magmatic origin, for example, those of Butte, Tonopah and Cripple Creek.

Classification.—Many attempts at classifying ore deposits were based on form and mode of occurrence. Lately geologists have realized that the form of a deposit was from a scientific standpoint less important than its origin. Schemes of classification have been devised which take into consideration both form and mode of origin, but the latest classifications are based wholly on origin. The following scheme is that proposed for metallic ore deposits by C. R. Van Hise:

1. Sedimentary
 - (a) Chemical precipitates
 - (1) Residual deposits
 - (2) Stream deposits
 - (3) Beach deposits
 - (b) Mechanical concentrates
2. Igneous
 - (a) Magmatic secretions
3. Metamorphic
 - (a) Deposited from gaseous solution
 - (1) Ascending waters
 - (2) Descending waters
 - (3) Ascending and descending waters
 - (b) Deposited from aqueous solution

Many other and more elaborate schemes have also been proposed.

See GEOLOGY and ECONOMIC GEOLOGY. For bibliography see ECONOMIC GEOLOGY.

Revised by PROF. C. L. DAKE.

OREADS, in Greek mythology, a name given to various nymphs of the mountains.

ÖREBRO, é-rë-broo, Sweden, (1) a town, capital of the län of same name, on the Svart-Elf, near the western extremity of Lake Hjelmar, 101 miles west of Stockholm. Its buildings are almost entirely modern, having been erected after the great fire of 1854. One of these is a handsome Gothic town-hall. The only ancient buildings are the castle, on an island in the river, now used for public offices, and the church, which contains some interesting monuments. The manufactures comprise machinery, chemicals, matches, etc., and there is a good trade. Örebro was the first Swedish town in which the Reformation was formally established (1529), and it was for a long time, of very considerable importance as the meeting place of the diet. Pop. about 25,000. (2) The län consists generally of undulating plains, watered by numerous streams, and containing many lakes. The only hilly district is in the north where there are several forests and valuable iron and other mines. The pastures rear fine cattle. The only exports of consequence are iron and timber, transmitted to Stockholm or Gottenburg.

OREGON, one of the United States, on the Pacific Coast, bounded north by the State of Washington, from which it is separated principally by the Columbia River; east by the State of Idaho; south by Nevada and California, and west by the North Pacific Ocean. The State lies between lat. 42° and 46° 18' N. and between long. 116° 33' and 124° 25' W. Its extreme length from east to west is 395 miles, and from north to south 295 miles. Its area is 94,500 square miles of land surface and 1,092 square miles of water surface, divided (1917) as follows:

	Acreage	Per cent of total acreage
In national forest reserves.....	13,470,248	22.014
Indian reserves.....	1,825,987	2.984
National park reserves.....	164,040	0.268
Public lands open to entry.....	15,969,846	26.099
Not patented or otherwise classified as to ownership.....	3,152,993	5.153
Carey act lands.....	360,382	0.589
Carey act lands pending.....	62,152	0.102
State school lands.....	624,210	1.020
In cities and towns.....	134,496	0.220
Cultivated lands.....	4,930,396	8.058
Commercial timber.....	9,547,116	15.603
Tillable lands (uncultivated).....	5,084,858	8.310
Non-tillable lands.....	5,826,200	9.522

Oregon ranks seventh in size among the States and was admitted to the Union 14 Feb. 1859. There are 36 counties in the State. The population in 1920 was 783,389. The capital is Salem.

Topography.—Primarily Oregon is a mountainous State, two great ranges dividing it from north to south; the Coast Range from 10 to 30 miles from the ocean; the Cascade Mountains from 110 to 150 miles inland; and a third, the Blue Mountains, constituting a group in the northeast part. The Coast Range has an extreme altitude of 4,000 feet, and is largely covered with dense forests. The Cascade Mountains, an apparent continuation of the Sierra Nevadas but with an entirely different geological history, have an extreme height of 7,000 feet, with several peaks rising 2,000 to 5,000 feet higher. Mount Hood reaches an altitude of 11,500 feet, McLoughlin or Pitt, 11,000 feet, and Jefferson, 10,500 feet. The Cascades are heavily timbered on their western slope to the snow line. Four transverse ranges connect the Coast Range with the Cascades: the Callapooia, Umpqua, Rogue River and Siskiyou Mountains. The Willamette River Valley, lying between the Coast Range and Cascade Mountains, and rising from the Columbia River to the Callapooia spur, is 150 miles long, from 10 to 70 miles wide, and is extremely fertile and contains the largest part of the population of the State. Eastern Oregon, embracing two-thirds of the State, is a high table-land, with little rainfall, and sparsely populated. There are fertile tracts along the rivers and lakes in the southern portion and in the Blue Mountains. The coast-line, which has an extent of 300 miles, is generally rugged and precipitous. There are, however, several bays or harbors, such as Tillamook and Coos, which are landlocked, with narrow entrances. Toward the south the coast runs to an angle ending in Cape Blanco.

Geology.—Oregon has had a varied geological history. The older sediments of the State are to be found in the Blue Mountains and in the Siskiyou Mountains. These belong to the Pre-Cambrian, Palæozoic and Mesozoic. In the Blue Mountains, metamorphic rocks, including serpentines, schists and gneisses represent the earlier rocks. Igneous intrusives, often of a granitic nature are there also associated with the generally non-fossiliferous sedimentary rocks of Pre-Mesozoic age. In southwestern Oregon these early formations include similar metamorphic and igneous types of rock. The upper Mesozoic is represented by sandstones and shales, of Cretaceous age, outcropping within the drainage basin of the upper Deschutes, Crooked and John Day rivers of eastern Oregon and along the Rogue, Umpqua and Coquille rivers in western Oregon. The Cascade and Coast ranges are of Tertiary Age, consisting of marine sediments and volcanic flows and tuffs. In the Cascades these rocks are basaltic and are in part probably a portion of the great fissure flows which buried the larger part of eastern Oregon to a depth of at least a mile. Later flows of a more andesitic nature, and probably issuing from isolated volcanic cones, are represented within the higher Cascades, and especially in the vicinity of such volcanic peaks as Hood, The Sisters, Mount Jefferson and Mount Mazama (Crater Lake).

Glacial deposits of local nature occur in the lower reaches of the high valleys of the Blue, Stein and Cascade mountains. Gold, copper, silver and chromite have been obtained from mines within the Blue Mountains. The gold is mined both in quartz mines and as placer. Dredging operations are still in progress on the Powder River as well as along certain streams in western Oregon, where platinum has been obtained in small amounts. Some metal mining is to be found at several localities along the western flank of the Cascades. A quicksilver property at Black Butte (near Cottage Grove) has resumed operations. Although coal occurs in the sediments dipping beneath the Cascade lavas on the west side of the range, coal mining operations are confined to the Coos Bay and Nehalem basins in the coast region.

Rivers and Lakes.—The largest river is the Columbia, which forms three parts of the northern boundary of the State and flows nearly due west for over 300 miles, and is navigable to its mouth in the Pacific. Its great tributary, the Snake River, flowing north and serving as a boundary of a great portion of the State eastward, and its affluents, the Umatilla, John Day and Deschutes rivers, on the east side of the Cascade Range, and the Willamette on the west side, all flow into the Columbia. The Columbia has a drainage area of 245,000 square miles. The head of navigation for sea-going ships is at Portland, on the Willamette, about 100 miles inland. From here to the cascades navigation for river steamers is open the year around. Above the dalles the Columbia is navigable for 190 miles and the Snake River for 180 miles. The lower and upper stretches are now joined by a government ship canal on the south side of the river. The Columbia is noted for its beautiful scenery and the great number of salmon taken from its waters. The Columbia Highway, a new scenic motor car roadway, is carved high on the cliffs along its southern bank between Portland and Hood River. Other well known rivers in the State are the Rogue, Coquille, Umpqua, Siuslaw, Alsea, Yaquina, Nestucca, Nehalem, Lewis and Clarke, Clatskanie, Youngs, Sandy, Hood, Owyhee, Malheur, Burnt, Powder and Grande Ronde. The principal lakes are Klamath, Goose, Warner, Salt, Christmas, Albert, Summer, Silver, Henry and Malheur. Crater Lake in the Cascades, 8,000 feet above sea-level, is the crater of an extinct volcano, 10 miles in circumference, and surrounded by bluffs 2,000 feet high. It is the deepest body of fresh water in America. With its surroundings it constitutes a National Park. Goose Lake and Lower Klamath Lake lie partly in California.

Climate.—The climate can best be described by making a sharp distinction between western Oregon, west of the Cascades, and eastern Oregon, east of those mountains. A warm oceanic current from Japan flowing southward along the Pacific Coast gives western Oregon a very mild winter climate. In the summer the northwest winds are cool. On the coast the mean temperature for January is 42.4° and for July 62.3°, while great extremes are rare. Properly speaking, the year in western Oregon is divided into two seasons, the wet and the dry, although the usual names of the four seasons are, in general use. The rains begin

in September or October, continue to February or March and with lessened frequency and volume into May or June. From May to August there is frequently little rainfall in western Oregon except along the coast line and in the mountains. On the coast the rainfall averages 89.6 inches; in the Willamette valley, 35 to 50.8 inches. Thunderstorms are rare. A climatic curiosity is the "silver thaw," experienced occasionally in Portland—a freezing misty rain which sometimes tears down trees and wires by coating them with ice during a cold night. The three western valleys, the Willamette, Umpqua and Rogue, have distinct peculiarities, the more southerly approaching eastern Oregon in climate. Eastern Oregon is a land of much less rainfall and greater extremes of temperature. The distinction between a wet and dry season does not exist. The mean temperature is 29.6° for January and 66.9° for July. In winter the extremes fall below zero; and sometimes nearly 30° below. The rainfall averages 12.7 inches in the northeast and in the south-central portion only 6.5 inches. Thunder storms are not unusual.

Fauna.—Since Oregon has been populated and developed the grizzly bear, black bear, cinnamon bear, gray wolf, coyote, panther, catamount, wildcat, polecat, deer, antelope, elk and mountain sheep, all formerly very numerous, have retreated to the mountains or gradually disappeared. The grizzly and cinnamon bear and the mountain sheep are virtually extinct. There are still to be found in more or less abundance such animals as silver foxes, martens, rabbits, squirrels, raccoons, porcupines, beaver, muskrats and seals, and rarely the river otter, while in the lakes and rivers are salmon, herring, trout, halibut, smelt and other fish. Crabs and clams are taken in large quantities. Oysters and shrimp are negligible. The birds include the eagle (scarce), hawk, pelican, cormorant, gull, crane, vulture, buzzard, raven, crow, jay, robin, swallow, sparrow, hummingbird, swan, goose, duck and pigeon. Reptiles and insects of the more common varieties are numerous.

Minerals.—Oregon abounds in mineral wealth, but gold is the only product extensively mined. It is found mostly in the northeast, in the Blue Mountain region. Silver, lignite, coal, zinc, cinnabar, platinum, iridium, lead, antimony, iron, copper, magnetite and nickel are also found here. In 1908 the principal mineral productions included gold, 41,848 fine ounces; silver, 43,315 fine ounces; and coal, 77,017 short tons; and, in 1909, gold valued at \$712,000, silver \$37,000, coal \$235,085. The building stones are granite, valued at \$5,300; sandstone, \$5,450; and limestone, \$10,900. The production of mineral waters was 50,000 gallons, valued at \$12,000, and the clay products had a value of \$327,000. In 1917, under war conditions, 3,000,000 pounds of copper was produced, gold to the value of \$1,920,000, and 280,000 ounces of silver. The war stimulated the production of chromium, and 12,000 tons was produced, the sale price ranging from \$18 to \$30 a ton. In 1921 only 174,300 pounds of copper, valued at \$22,485, were produced. In 1920 coal to the value of \$93,000 was mined, metals about \$4,000,000, and non-metals other than coal, \$1,500,000. Two large cement plants now are in operation in the State, each with a capacity of 1,000 barrels

of cement a day. The limestone and other necessary ingredients are quarried near at hand. In 1921 42,668 troy ounces of gold, with a value of \$882,034, was mined in Oregon.

Fisheries.—The canning of fish ranks second among the industries of the State, the Columbia River producing canned salmon valued at \$6,530,939 in 1917, as compared with \$1,643,324 in 1890. This industry, which is almost entirely the canning of salmon caught in waters of the Columbia River and its tributaries, has its centre in the city of Astoria. It was once carried on almost exclusively by the Chinese but now Portuguese and Swedish interests practically control. The industry dates back to 1866, and reached a record production in 1883 which afterward decreased. It is carried on also on the north side of the Columbia River, in the State of Washington, the value of the product of this latter State in 1890 being nearly a third of that of Oregon. The Columbia River has long been famous for its salmon, the product for the year 1895 "exceeding in value that of any other river in the United States or the world." The exhaustion of these fisheries has been averted by more rigid laws against impovident fishing, and by the artificial propagation of fish. Since 1898 several refrigerating and freezing plants have been erected, and these, together with the use of refrigerator cars have made possible the shipment of hundreds of tons of fresh fish annually from Portland to the East and to European cities—a fact which has tended to check the increase in the canned product during recent years. There are a few canneries further down the coast, which add somewhat to the total product. The following figures are for the Columbia River:

YEAR	Cases	Value
1907	324,171	\$1,763,490
1908	253,341	1,380,708
1909	274,087	1,760,088
1910	391,415	2,544,198
1911	543,331	3,052,164
1912	285,666	2,319,856
1913	266,479	2,012,387
1914	454,621	3,595,989
1915	558,534	4,305,292
1916	547,805	4,361,075
1919 (Entire State)	511,325	5,447,491

As these figures include only the salmon actually packed in cans, there can be added at least 15 per cent for mild cured, salted and fresh used fish. The increase in the salmon output on the Columbia River for the past few years is credited to the system of retaining and feeding the fry before liberating them, inaugurated by the Fish Department of this State in 1910. Prior to 1910 the young salmon were practically turned out with the yolk sack attached, or as soon as the same was absorbed. At the request of the principal salmon packers on the Columbia River, who furnished the funds, the State installed retaining and feeding ponds at the State hatcheries, and at the present time all the fry are retained and fed from four to nine months before liberated.

Forest Resources.—About 38 per cent of the State of Oregon, or 36,000 square miles, was originally forested. Some of this area has been logged over and either cleared for agricultural use or has become restocked naturally with "second-growth" timber; but the great majority of the forested territory of the State

still remains in its pristine condition, untouched by the axe. The forests in Oregon are of great variety, due to the wide range in climatic conditions between the humid belt in the western part of the State and the arid zone east of the Cascade Range, and between the equable temperature at sea level and the rigorous one at perpetual snow line on the mountains. There grow naturally in the State 75 varieties of trees — of which 32 are conifers, such as pines, fir, spruce and cedar; and 43 are broadleaf trees, such as maple, ash, oak, alder, cottonwood, myrtle, madrone, etc. The hardwood trees are usually very much in the minority, occupying an understory or occasional spots in the forest. The important commercial timber is almost wholly of coniferous trees. The principal tree of the forests west of the Cascade Range is Douglas fir. It is a tree of great size in this State; reaching a diameter of 10, sometimes 12 feet, and a height of 275 feet and forming stands of almost tropical luxuriance that yield as high as 150,000 board feet of lumber per acre. It is the tree used largely in the State's new wooden shipbuilding industry. With the Douglas fir are found western hemlock, western red cedar, yew, noble fir, silver fir, white fir, and many other species of less commercial value or rarer occurrence. Close to the ocean is a strip of forest of great density and luxuriant growth in which Sitka spruce and Port Orford cedar, the principal sources of aircraft lumber, are found in their perfection, along with the other species mentioned above. Practically all the area west of the Cascade Range, except some prairies and meadows in the Willamette, Umpqua and Rogue River Valleys, was naturally forested. Probably 85 per cent of it is still in its virgin condition, but extensive logging operations and agricultural development are constantly reducing the amount of forest. East of the Cascade Range only about 15,000 square miles, or 23 per cent of the land surface, was naturally timbered; the remainder being grassland or sagebrush desert. The principal timber tree in this part of the State is western yellow pine. It forms open forests of trees from 18 to 48 inches in diameter and yields a lumber which is much in demand. With the yellow pine are found sugar pine, lodgepole pine, western larch, white fir, juniper and occasionally other species.

On the upper slopes of the Cascade Range and Blue Mountains, the valuable commercial forest of the lower slopes gives place to a woodland of such species as mountain hemlock, alpine fir, lodgepole pine, white-bark pine. Due to the rigorous climate, their quality and size is inferior to the Douglas fir and yellow pine forests of the lower elevations. Forests extend to an altitude in Oregon of about 6,000 to 8,000 feet; but above 4,000 feet on the west side of the cascades and 5,500 feet on the east side, they are not of a quality to have present-day commercial value for lumber. Their value for watershed protection in the regulation of stream flow is, however, inestimable. The latest estimates* indicate that there is in Oregon 444 billion feet of timber, of which 134 billion is in government ownership on the National Forests, 10 billion is in Indian reservations, and most of the remainder is in private ownership.

The distribution of the 444 billion feet by species is about as follows:

SPECIES	Per cent
Douglas fir.....	63
Western yellow pine.....	16
Western hemlock.....	6
Western red cedar.....	3
Spruce.....	2
Sugar pine.....	2
All others.....	8

This is the estimated stand on the entire forested area. The amount of timber of commercial quality is somewhat less. Forest fires have in the past wrought havoc in the forests of Oregon. The evidence indicates that fires have scourged these forests since time immemorial. Before the advent of man they were caused by lightning, then by the Indians in their effort to make hunting easier or to get grass for their ponies, then by the first white settlers to clear land for their farms, and later by the careless or thoughtless loggers or campers who allowed fire to escape. In the late summer after the dry season, the forests are exceedingly inflammable. The most startling feature shown by the land classification of this State is the extent of the burned areas, especially in the coast ranges and in the northern half of the Cascades. These burned areas comprise altogether not less than 7 per cent of the area of the State. Out of a total area, at one time timbered, not less than 18 per cent has been destroyed by fire. Happily, through the efforts of the timberland owners, fire protective associations, the State Forester, and the Federal Forest Service, the forests of Oregon are now well protected from fire and the annual loss of timber is greatly reduced, and the burned areas are rapidly being reforested. The earliest burns in the State of which we have record occurred in 1843. From that time down to 1903, fires of greater or less magnitude occurred yearly, mainly in the late summer and early fall when everything was driest. About 30 per cent of the timber of Oregon, and 57 per cent of the present timbered area — 13,153,546 acres — is in National Forests under Federal control. These National Forests are divided into 16 administrative units, which occupy the "permanent forest land" in the more rugged and mountainous parts of the State; namely, on the Coast Range, Siskiyou Mountains, Cascade Range and foothills, and Blue Mountains. The mature timber on the National Forests is being sold and cut as opportunity offers, but under such regulation as insures the perpetuity of the forest. The National Forests are supervised and administered by the Forest Service, a bureau in the Department of Agriculture. Portland, Ore., is the headquarters of the United States District Forester having general supervision over the 43,000,000 acres of National Forest land in Oregon, Washington and Alaska. The table on following page shows the National forests of Oregon and the headquarters of the supervisors in charge.

The State Forester, with headquarters at Salem, executes all matters pertaining to forestry within the jurisdiction of the State. He is the executive officer of the State Board of Forestry.

The timber of the National forests is being sold by the government at an average between

\$2.50 and \$3 per thousand feet, according to the value of the varieties of timber. Of the amount of revenue received by the government from this source, 25 per cent of the net receipts is paid into the State treasury for apportionment among the counties of the State in which National forests exist, for the benefit of the public schools and roads, and 10 per cent is expended for the improvement of roads within the forests. Grazing privileges for stock are also permitted by the Forest Service upon the reserves, for which a graduated scale of fees is charged per season, based upon the year-long rate of 60 to 64 cents per head for cattle, 75 to 80 cents per head for horses, 36 to 38 cents per head for swine and 15 to 16 cents per head for sheep and goats. The year-long grazing rate is higher on the coast forests because of better growth and comparatively longer seasons. The State also receives 25 per cent of the net revenue from this source, which is apportioned among the counties and applied in the same manner as in the case of the timber sales fund, and 10 per cent of the net receipts is applied to improvement of roads within the reserves. The gross receipts from timber sales within the forests of Oregon for the fiscal year ended 30 June 1914, amounted to \$159,549.99, and for grazing privileges, \$84,072.97, making a grand total of \$243,622.96. The number of stock grazed within the forests of Oregon during the fiscal year period ending 30 June 1914, was cattle, 97,920; horses, 11,098; hogs, 433; sheep, 872,829; goats, 33.

There are also immense water power advantages in the National forests, which are being conserved for the benefit of the public, and title to which is never transferred outright to individuals or corporate interests. Homesteads not exceeding 160 acres in extent may be acquired within National forests under the act of 11 June 1906 (34 Stat. 233) on lands chiefly valuable for agriculture, not needed for public purposes, and the occupation of which for agricultural purposes will not interfere with the purposes for which National forests were created. If, considering all the circumstances, any land is considered to have a greater value for agriculture than for other purposes, it will be recommended for entry under the above act. The Forest Homestead Law is not a means of securing valuable timber lands under the homestead laws, since it must appear that land is chiefly valuable for agriculture before it will be opened to settlement and entry.

Lumbering.—Next to agriculture, the manufacture of lumber is the leading industry of Oregon. Two and one-half billion feet of timber was sawed in the mills of the State during

1917, and the annual value of Oregon lumber products was over \$30,000,000 even before shipbuilding had become the important industry it became in the war years of 1917-18. Lumbering always has and still constitutes fully 39 per cent of the State's industrial activities. Most of the lumber cut in 1917 was fir, although on account of the demand by the government for air-plane stock, probably 25,000,000 or 30,000,000 feet of spruce were cut in the last half of the year. Oregon's lumber is marketed all over the world. Ships of every nation come into the Oregon harbors to carry it away. California is another heavy purchaser, and thousands of cars are sent overland by rail. Oregon sells its lumber in all the northern group of States west of the Mississippi. The finished product of the Oregon mills, such as sashes and doors, is sent as far east as New York and the New England States. Furniture manufacturing has developed rapidly in the last decade. Portland is the principal furniture manufacturing centre west of Chicago. It has a score of plants, of which fully half a dozen are of major importance. The furniture output in a recent year had a value of \$4,500,000. It was sold south as far as Los Angeles and east as far as Denver and in all the intermediate territory.

Shipbuilding.—While Oregon is primarily an agricultural and lumbering State, her greatest progress in the year 1917 was in industrial pursuits. This was due almost entirely to the development of the shipbuilding industry and to other activities growing out of the World War. Portland under war conditions became the principal wooden shipbuilding centre on the Pacific Coast. Including one plant at Vancouver, Wash., the city by January 1917, had nine wood-shipyards in operation. The Vancouver plant is included because Vancouver is directly across the Columbia River from Portland and for all commercial purposes is a part of Portland. These wood-shipyards in the State outside of Portland in January 1917 included three at Astoria, one each at Marshfield, Tillamook, North Bend, Saint Helens and Columbia City. These wood-shipyards had already launched an aggregate of 37 vessels and had contracts for 148 additional, many of which were in course of construction. These plants are equipped with an aggregate of 74 ways and had 33 additional ways projected. The Oregon yards could launch an average of one wooden ship every other day. These vessels vary in size from 3,500 to 4,400 tons. Portland is the home of four steel-shipyards. These plants received contracts for an aggregate of 55 vessels; most of this work being done on government contracts. The steel vessels cost an average of approximately \$1,700,000 each. In 1920 shipbuilding, including boat building, turned out products valued at \$13,778,000.

The shipbuilding industry in Oregon and Vancouver, Wash., represented (1918) an investment of nearly \$25,000,000 and gave employment to nearly 20,000 men of whom about 15,000 were employed in Portland. Shipbuilding also gave great impetus to many closely related industries, such as the construction of steel and wooden lifeboats, brass and steel fixtures, galvanized iron, sheet metal, engines and machinery of various sorts used in shipbuilding.

OREGON

1 Sugar Pine along road from Medford to Crater Lake 2 Oregon Fir, "the king of commercial woods"—so named by the French. The Oregon Douglas Fir is one of the finest of commercial woods. The trees grow to great height and girth—trees from 12 to 15 feet in diameter are giants, but Oregon has hundreds of thousands of fir trees 10 and 12 feet in diameter. The tree shown is well over 12 feet in diameter

Agriculture.—In western Oregon, notably in the valleys of the Willamette, Umpqua and Rogue rivers, the soil is chiefly a dark silt loam. The hills have a somewhat heavier red soil and the mountains are timbered heavily and used for grazing. In the eastern part, the soil is lighter silt loams and sandy loams in general, with more or less alkali in spots, but is very fertile under irrigation. In the northeast, the Columbia basin and the Blue Mountain valleys, extensive areas of naturally fertile wheat lands are found; in the southeast, the cultivation of crops is as yet less fully developed but the land is extensively used for grazing purposes. The total number of farms in Oregon in 1900 was over 30 times as great as in 1850 and 40 per cent greater than in 1890. In 1920 it was 37.3 per cent greater than in 1900. The total acreage has also increased rapidly, being over 23 times as great as in 1850. The increase from 1910 to 1920 was 15.9 per cent on farm lands and 14.9 on improved land, in spite of the inclusion of an Indian reservation of 484,000 acres as a "farm" in the former census.

For the year 1922 the best available figures indicate that Oregon produced and sold farm products as follows:

CEREALS.

CROP	Quantity bushels	Value
Wheat.....	19,444,000	\$21,323,000
Oats.....	6,675,000	3,805,000

Total fruit products.....		\$20,035,775

Oregon produced and sold approximately \$25,000,000 worth of fresh and dried vegetables, many of which were exported or sold in distant parts of the United States. The aggregate value, therefore, of Oregon farm products marketed in 1920 was \$131,884,000. The fruit-growing industry is most extensive in the region lying between the Cascade and Coast ranges.

Irrigation.—In western Oregon in the Willamette Valley and Coast counties there is a very heavy rainfall and irrigation is not used but irrigation of hay lands (resulting in an

extra cutting) is reported from the Rogue River valley in the southern part of this section. The greater part of the eastern section is semi-arid, but the soil, as a rule, is very productive when there is sufficient moisture. There are numerous rivers and the available water-supply of the section as a whole is large. In the counties bordering on the Columbia River, irrigation is generally practised where water is available and the remainder of the area is devoted to dry-farm wheat raising. A great part of the territory south and west of these counties is used both for dry farming and irrigation, and the higher lands for grazing purposes. In the Rogue River Valley in Jackson and Josephine counties, hay is the only crop usually irrigated, but a number of systems have been started or projected for the purpose of supplying orchard lands with water. The total number of irrigators in Oregon in 1900 was 4,636, while in 1920, 9,154 farms were irrigated, 18.2 per cent of the number of farms in the State. The total area irrigated grew from 388,310 acres, in 1900 to 986,162 in 1920. This was 20.1 per cent of the improved land in farms. The area to which enterprises existing in 1920 were capable of supplying water was 1,344,046 acres, and the total acreage included in existing projects completed or under way in 1920 was 1,925,987.

Livestock.—Oregon is the home of an important livestock industry. The total value of the hogs, cattle, sheep, horses, mules and goats owned in the State was estimated in 1920 at \$101,779,342. At Portland the Union Meat Company, which is a subsidiary of the Swift Packing House enterprise of Chicago operates a large packing-plant, which attracts livestock from the region west of the Rocky Mountains. The products of this plant are sold both locally and in the territory tributary to Portland and in normal times some of it is exported. There were 21 slaughtering and meat packing establishments in the State in 1919, with 772 wage-earners, and turning out products to the value \$15,868,000. Portland is a principal livestock centre of the Pacific Coast, a modern stockyards being operated in that city. These stockyards have had a large influence in the livestock industry of the State. Before this market was established in Portland most of the hogs consumed in that city were brought in from Nebraska and other points in the Middle West. Now Oregon produces all its own hogs.

There is excellent pasturage in Oregon and horses, cattle, swine and sheep are raised in large numbers. On 1 Jan. 1920 the total value of all livestock on farms and ranges was \$98,457,779. Of this, cattle represented \$47,818,486 (including \$18,390,981 in dairy cows); horses, \$19,225,842; mules, \$1,589,552; asses and burros, \$150,592; swine, \$4,664,307; sheep, \$24,423,544; goats, \$585,456. The foregoing livestock was reported from farms; but there were some thousands of animals, including 21,350 cattle, on range. The table on the following page shows the changes since 1850 in the numbers of the most important domestic animals on enclosed farms.

The number of dairy cows in Oregon in 1901 was almost 13 times as great as in 1850 and 7.3 per cent greater than in 1890. Nearly 18 times as many neat cattle, other than dairy

YEAR	Dairy cows	Other neat cattle	Horses	Mules and asses	Sheep	Swine
1923	220,000	626,000	272,000	14,000	1,953,900	231,000
1910	172,402	552,146	271,111	10,324	2,696,779	217,496
1900	122,447	577,856	287,932	7,751	1,961,355	281,496
1890	114,156	406,492	224,962	4,946	1,780,312	208,259
1880	59,549	356,693	124,107	2,804	1,083,162	156,222
1870	48,325	71,872	51,702	2,581	318,123	119,455
1860	53,170	100,961	36,772	980	86,052	81,615
1850	9,427	32,302	8,046	420	15,382	30,325

cows, were reported in 1900 as in 1850. Oregon produced about 12,992,000 pounds of wool in 1922, with a value of approximately \$4,330,666 (average 1922 price). In 1910 the census reported the value of the wool clip \$3,306,179. The State still is one of the biggest wool producers in the Union. The census notes a slight decrease in number of fleeces, but increase in weight and value. Portland is the principal wool market on the Pacific Coast and in this particular is second only to Boston in the United States at large. All the wool produced in the Northwest west of the Rocky Mountains is marketed in Portland.

Manufactures.—Oregon is destined to be one of the great manufacturing States of the West, if not of the entire country. The natural advantages of the State are extensive, furnishing raw material for its various manufacturing enterprises and its streams furnish abundant water power of approximately 20,000,000 horsepower or one-third of all the undeveloped water power in the United States. This is located in the Columbia Basin. (Senate Document 676, 60th Congress, 2d Session). Of this amount, over 3,000,000 horsepower is within economical transmission distance of tidewater at Portland. The total developed water power in Oregon at present amounts to 158,186 horsepower. The principal industries include steel and wood ship-building, much stimulated by the war, car and shop construction, pulp and paper manufacturing, fruit and fish canning, furniture, cordage, flouring-mills, rubber products, lumber and timber, printing and publishing, slaughtering, meat-packing, leather tanning and the manufacture of woolen goods. In 1919 there were reported by the United States census, 2,707 manufacturing establishments employing \$237,254,736 in capital and 68,005 persons, expending \$206,206,041 for raw materials, \$95,092,955 in wages and having an annual output valued at \$366,782,627 exclusive of the ship-building industry. The 22 ship-building plants in the State in 1917 reported 23,450 wage-earners and products valued at \$162,000,000, as compared with 30 establishments, 2,990 wage-earners and products valued at \$13,778,000 in the same industry in 1919. The Columbia River was the centre of the wood ship-building industry in the United States during the World War, Portland building more wooden vessels than any other city. In steel ship-building, the Columbia River district stood second on the Pacific Coast. In furniture manufacturing, Oregon is fast coming to the front as a furniture centre. The furniture industry of the State for 1919 totalled \$3,183,000. The largest pulp and paper plant in the entire West is located in Oregon. Eight woolen mills of large capacity are located at Portland, Pendleton, Oregon City, Bandon, Salem and Stayton. Flour-milling reflects the

large wheat-growing interests of the State, the production of this cereal amounting to 19,444,000 bushels of wheat, 6,675,000 bushels of oats, 2,160,000 bushels of barley and 444,000 bushels of rye in 1922. The flour-milling industry gave employment to 822 wage-earners in 1919 and had a product valued at \$42,550,000, as compared with 281 wage-earners in 1890, and a product valued at \$4,184,473.

Oregon is the principal woolen manufacturing centre in the West. Six important woolen mills were in operation in the State in 1918. Most of them in 1918 were working on government contracts but their normal output consists of woolen cloth, blankets and other high-grade materials. A large amount of Oregon's native wool is consumed in these mills. The industry has more than doubled in the last five years and in 1918 employed about 1,000 men and women. Most of the output is marketed on the coast, but recently large shipments have been sent east and considerable volume has been exported. In 1919 the woolen manufacturing plants gave employment to 808 wage-earners and had products valued at \$3,357,000 as compared with 358 wage-earners and products valued at \$614,932 in 1890. The importance of this industry in Oregon is largely a result of the extensive stock-raising interests of the State. Two large wool warehouses are located in Portland, having in storage some 20,000,000 pounds of wool annually.

The State is rapidly learning the economic advantage of preserving its orchard and garden products, either by canning or by evaporation. The dried fruit and vegetable industry is one of recent development in Oregon. Several plants now are in operation, including one at The Dalles and one at Salem. These plants are prepared to handle several thousand tons each of apples and cherries, in addition to thousands of tons of peaches, prunes, berries and other fruits. They also handle several thousand tons of mixed vegetables and the same quantity of potatoes. The greatest benefit that the dried fruit and vegetable plants yield to the State is in the utilization of products that otherwise would go to waste. Another important enterprise is paper manufacturing. Oregon City is the centre of this industry. Native wood is used in the manufacture of pulp and paper. The power for the operation of these plants is generated by the falls of the Willamette River. The mills of this State supply the paper upon which most of the newspapers west of the Rocky Mountains are printed. Great quantities of news stock also are exported to Australia and other points in the Pacific. Another important new industry is the manufacture of loganberry juice. The headquarters are at Salem, where two large plants are operated.

Cascades of the Columbia River

The loganberries are grown in large quantities in the farming communities near Salem and this industry is gaining additional prominence every year. The value of the juice production for 1917 is estimated at \$500,000. Most of it is marketed in the East. The production has been limited only by the quantity of berries produced by the farmers, as the demand for the juice has hitherto been greater than the supply. Rubber manufacturing promises to become an important industry. Two new plants are operating in Portland. Both of them are growing. Because much of the crude rubber used in the United States now is imported from Asia it must pass through the Pacific Coast ports in order to reach the eastern factories. The economic waste of sending this commodity across the continent in its crude state and then sending much of the finished product back is one of the most potent factors in encouraging the rubber industry in Oregon. A new enterprise of promise is the kaola plant in Portland, which produces cocoanut oil and its by-products. The dried copra for this plant is brought in from the South Sea Islands and Australia on vessels which carry lumber and other Oregon products out.

Commerce.—Before 1886 the exports from Portland were mostly to San Francisco and Honolulu, gold dust and ores forming three-fourths of the shipments. Now the exports reach almost every part of the globe and consist largely of wheat, meat and timber products. The foreign commerce of the State, which emanates mostly from the Columbia River, runs into many millions of dollars annually, three-fourths of it being exports. The largest export countries are Great Britain, China, Japan and other Oriental ports, and the west coast of South America. The principal port is Portland at the confluence of the Willamette and Columbia rivers. Astoria, another port, is at the mouth of the Columbia itself. There are also harbors for coastwise shipping at Port Orford, Rogue River, Coos Bay, Tillamook Bay and Yaquina Bay. A few of the important imports coming from the Orient are copra, crude rubber, spices, sisal and merchandise.

Banks and Banking.—There was a private bank in Portland as early as 1858. In 1865 the First National Bank—the first west of the Rocky Mountains, was established in Portland. In 1922 there were 97 national banks in operation, 175 State banks and five trust companies. The volume of cash and checks passing through the Portland clearing house during 1922 amounted to \$1,563,491,000. This is due largely to the growing jobbing business done in Portland which is a logical point of distribution for a trade territory of over 254,000 square miles, reached mostly by railroads of a "water grade," an economic advantage rare in the western half of the country. Bank deposits the same year amounted to \$212,376,000, of which \$24,697,000 was in savings deposits including postal savings accounts. Demand deposits aggregated \$54,831,000 and time deposits \$10,681,000.

Transportation.—In 1865 there were but 19 miles of railroad in the State, 248 miles in 1875, 582 miles in 1880 and 1,695 miles in 1901. In 1919 there were 16 commercial steam railroads operating 3,455 miles of main line; com-

mercial electric roads, 722 miles; these include steam industrial roads, and street car lines serving Portland, Eugene, Salem, Albany and Astoria, making a total railway trackage of 4,177 miles, including over 700 miles of electric railway track. Steamship lines ply regularly between San Francisco and Portland and other Oregon ports, and river boats operate on the Columbia, Willamette and Snake rivers. The Union Pacific and the Southern Pacific are the two principal railroad lines. Common carriers, together with other public utilities in Oregon are under a State Public Utilities Commission.

Government.—New York and Iowa statutes were the models for the provisional government of Oregon and subsequent legislation followed these lines. The governor is elected for a term of four years and receives a salary of \$5,000 per annum. Legislative sessions are held biennially and are practically limited to 40 days each, members serving without pay if the session extends beyond that period. The legislature has 30 members in the senate and 60 in the house, each of whom receives \$3 a day and mileage. There are three representatives in Congress. There is a Supreme Court, with appellate jurisdiction, the court consisting of seven judges, who are elected for six years and paid \$4,500 a year. There are 20 Circuit courts with 28 judges. There are county courts, executive and administrative in function, with one judge, elected for four years, who is also judge of probate, and two associate commissioners. The Circuit Court judges are elected one-third every two years. There is also a United States District Court. Justices of the peace are elected in every precinct and municipal courts may be created. The constitution authorizes any citizen of the United States, 21 years old and six months a resident of the State, to be a voter. New ballot laws, modeled on the Australian system, were adopted in 1891. Of late years many governmental functions have come to be exercised by commissions created by the legislature. It has been a prevailing policy in Oregon to assign by law membership in such commissions to one or more designated State officers. Several of the most important commissions consist of or include the governor, secretary of state and State treasurer. By this process these offices have become much more powerful and comprehensive in function than their titles would indicate. Oregon was the first State to operate extensively the initiative, referendum and recall, a method of government, therefore, sometimes known as the "Oregon System." Either proposed constitutional amendments or proposed statutes are easily placed upon the ballot by petition and are then either enacted or rejected by a simple plurality.

Finances.—There is a public debt of \$52,290,470. The State revenue from taxation as enrolled for the year 1922 was \$43,304,597 on a real property valuation of \$748,912,570 and personal property to the amount of \$271,891,618. There are revenues also from State school money loaned, for school lands sold, or interest on school loans. The disbursements for the year, 1 Oct. 1921 to 30 Sept. 1922, amounted to \$38,594,525. The constitution prohibits the legislature from contracting any State debt exceeding \$50,000, or assuming the debt of any county, town or corporation, except for purposes of war

or to suppress an insurrection. The cash balance in the treasury 30 Sept. 1922 was \$6,296,817.

Public Institutions.—At Salem are located the School for the Deaf; State Insane Asylum; State Tuberculosis Hospital; School for the Blind; Boys' Reform School; State Industrial School for Girls; State Institution for Feeble-minded and the Oregon State Penitentiary. At Roseburg is located a Soldiers' Home and at Pendleton a second State Hospital for the Insane.

Education.—In 1848, Congress gave the State an area of 3,387,520 acres of the public domain for free schools, and also gave 500,000 acres for a State university, and 90,000 acres for an agricultural college. The free school system has extended to every township in the State. In 1922 the children of school age numbered 221,179; the enrolment in public schools, 164,705; and the average daily attendance, 76 per cent. There were about 2,514 public schools, public school furniture and apparatus valued at about \$2,000,000; houses and grounds valued about \$18,000,000, and 6,722 teachers. Their salaries for the year averaged \$870, and total expenditures \$14,783,718. For higher education there were 245 standard public high schools in 1922, with 30,247 pupils, also private secondary schools; with about 1,500 pupils, one public normal school and 8 universities and colleges for men and for both sexes. The colleges include the University of Oregon, at Eugene; State Agricultural College, Corvallis; Reed College, Portland; Pacific University, Forest Grove; Willamette University, Salem; McMinnville College, McMinnville; Pacific College, Newberg; Philomath College, Corvallis. There is a federal government Indian training school at Chemawa, near Salem, and a State normal school at Monmouth.

Religion.—The religious denominations of the State are given in the order of their strength and influence, as follows: Roman Catholic (42.9 per cent in 1890; 29.4 per cent in 1906); Methodist bodies (16.9 per cent in 1890; 18.1 per cent in 1906); Baptist (7.8 per cent in 1890; 9.4 per cent in 1906); Presbyterians (7.4 per cent in 1890; 9.1 per cent in 1906); and the Disciples of Christ or Campbellites (5.8 per cent in 1890; 8.7 per cent in 1906). The church membership in 1922 was 179,468. In 1890, 30,231 Roman Catholics were 42.9 per cent of the church population; in 1906, the 35,317 Catholics were 29.4 per cent. In 1921 the Roman Catholic church membership was reported officially as 67,123.

Indian Reservations.—There exist in Oregon the remnants of a large number of Indian tribes, most of which are aboriginal to this region, representing more than 10 distinct linguistic stocks. They have been collected largely upon five reservations, namely, Grande Ronde, Klamath, Siletz, Umatilla and Warm Springs, while some still live along or near the Columbia River, and depend upon fish and game for their support. Grande Ronde reservation is situated in the northwestern part of Oregon, in Polk and Yamhill counties, and contains an area of 93¾ square miles. Approximately 10,000 acres are arable, being a fair quality of land, lying in the small valleys along the tributaries of the Yamhill River. The Indians at Grande Ronde represent the remnants of nine small tribes: the Clackamas, Cow Creek, Lakmiut, Mary's River, Rogue River, Santiam, Umpqua, Wapete and

Yamhill, numbering in all 402. The larger number cultivate their own allotments and those of the infirm members of their families. Oats and wheat are their principal crops. Klamath Reservation lies east of the Cascade Mountains, in Klamath and Lake counties, and embraces an area of 1,650 square miles.

History.—There is much uncertainty surrounding the early explorations of the North Pacific Coast. Spanish and English navigators undoubtedly reached the Oregon coast in the 17th century. Captain Cook landed at Mootka Sound in 1778, and the French navigator, Laperouse, sailed along the coast in 1786. In 1789, two Americans, John Kendrick and Robert Gray, were sent out by Boston fur merchants, and in 1791 Gray gave the Columbia River its name. In 1805-06, the Lewis and Clark expedition explored considerable of the Oregon region. (See LEWIS AND CLARK EXPEDITION). In 1811 the American Fur Company established trading posts at Astoria. (See ASTOR, JOHN JACOB). The northwestern boundary between the United States and Canada was fixed by the convention of 1818, as the line of 49° from the Lake of the Woods to the Rocky Mountains. West of this point the territory was to be open to both parties for 10 years. (See NORTHWEST BOUNDARY). By the convention of 1827, ratified in 1828, joint occupation was continued indefinitely. The Oregon question (q.v.) occupied the attention of Congress from 1820 to 1824. The Methodists founded a mission under Jason Lee in 1834, and the American Board (Presbyterian, Congregational, etc.), under Marcus Whitman in 1836. In 1839 the emigration of New Englanders commenced overland by way of the South Pass, and the Territory continued to receive settlers from the east and middle west by this route until the railway superseded the ox-team. In 1848 the California "gold-fever" attracted a large quota of the territory's citizens away, but in 1850 the land-donation law, passed by Congress, had the effect of registering 8,000 citizens in Oregon, which was formally organized as a territory 3 March 1849. On 2 March 1853, Washington Territory was formed out of the northern half of Oregon. On 5 Nov. 1857, a State constitution was adopted; and 14 Feb. 1859 the State was admitted into the Union by Act of Congress under the constitution previously ratified. From 1845 till 1855 there was sporadic warfare with Indian aborigines, and a resumption of the same occurred in 1858, and again in 1866-68, when occurred the Shoshone War, and in 1864-73, when the Modoc War prevailed. Since 1875 the Indians have been confined on the reservations.

Politics.—Under the provisional government, 1843-45, adopted by the people 5 July 1843, the executive power was vested in a committee of three persons; the legislative power was vested in a committee of nine persons, elected by the qualified electors, giving to each district representation in ratio of its population, excluding Indians; the judicial power was vested in a Supreme Court, consisting of one supreme judge and two justices of the peace, and a probate court. Oregon had a provisional governor (1845-49) and seven Territorial governors (1849-59). The first governor under the State Constitution was a Democrat. In presidential elections the State is regarded as safely Republican, it having gone Democratic in presi-

dential elections only in 1868, and split the vote in 1892. Of late years the legislature is always overwhelmingly Republican, but no such uniformity exists in the election of United States senators and governors. In 1876 it was discovered that one of the Republican electors held a Federal office, and was consequently ineligible. The Democratic governor issued a certificate to the minority candidate, but the two Republican electors filled the vacancy, and their position was sustained by the Electoral Commission (q.v.).

The principal cities and towns are as follows: Portland (258,288); Salem (17,679); Astoria (14,027); Eugene (10,593); Medford (5,756); Baker (7,729); Oregon City (5,686); Albany (4,840); Corvallis (5,752); Roseburg (4,381); The Dalles (5,807); Pendleton (7,387); and La Grande (6,913). In 1922 there were about 900 post-offices of all grades; and 265 periodicals, of which 33 were daily, 1 three times a week, 11 semi-weekly, 174 weekly, 3 semi-monthly and 36 monthly. The total population of the State in 1850 was 13,294; (1860) 52,465; (1870) 90,923; (1880) 174,768; (1890) 313,767; (1900) 413,536; (1910) 672,756; (1920) 783,389. Of this number 102,151 are foreign born whites.

ERIC W. ALLEN,

Dean of the School of Journalism, University of Oregon.

OREGON, Ill., city, county-seat of Ogle County; on the Rock River, and on the Chicago, Burlington and Quincy Railroad; about 90 miles in direct line west of Chicago. It has considerable manufacturing interests. The chief manufacturers are foundry and machine-shop products, flour, pianos, street-sprinklers and dairy products. It has good schools and a public library. The waterworks are the property of the municipality. Pop. 2,227.

OREGON, a river in the western part of North America. See COLUMBIA RIVER.

OREGON, University of, the State University, chartered in 1872 and opened in 1876 at Eugene. Its organization comprises (1) the College of Literature, Science and Arts, including general courses in liberal arts and special courses in course preparatory to medicine; course preparatory to law; course preparatory to journalism; course preparatory to engineering. The bachelors' degrees conferred are A.B. and B.S. The University is coeducational, number of women students being about 40 per cent of the total. It is supported mainly by State appropriation; tuition is free; the income in 1924 was \$925,000. The library (1924) contained 130,000 volumes; the students numbered 2,427 and the faculty 134. (2) School of Law, a three-years' course, requiring two years' work in liberal arts for admission. (3) School of Architecture, a four-years' course. (4) School of Commerce, a four-years' course. (5) School of Education, a four-years' course. (6) School of Journalism, a four-years' course. (7) School of Medicine, a four-years' course in Portland, with two years' preparatory college work in Eugene. (8) School

of Music—piano, voice, violin, wind instruments, harmony and musical history. (9) Summer School, a six weeks' course. (10) School of Correspondence Study. (11) Graduate School.

OREGON BROOK-TROUT, the rainbow trout (q.v.).

OREGON CITY, Ore., county-seat of Clackamas County; on the Willamette River and on the Southern Pacific Railroad; about 14 miles south of Portland. The falls in the river, 40 feet in height, furnish extensive water-power which is used for the electric-light works and for the development of manufacturing industries. The chief manufactures are flour, lumber, woollen goods, soap, paper, pulp and furniture. It has a House of the Good Shepherd, public and parish schools and a public library. A passenger elevator, owned by the municipality, carries people up and down hill. The city owns pure mountain waterworks. Pop. 6,600.

OREGON QUESTION, *The*. The Oregon question of boundary between the United States and Great Britain involved the right to the territory upon the Pacific Coast of North America extending inland eastward to the Stony (Rocky) Mountains and bounded upon the south by the parallel of 42° N. lat., upon the north by the parallel of 54° 40' marking the southern limit of what was formerly Russian America. The claim of the United States to this territory was based upon the discovery, 11 May 1792, of Capt. Robert Gray of Boston, who, in the ship *Columbia*, entered the river called Oregon by the Indians. "He passed its bar and anchored in the river, 10 miles above its mouth" and "afterwards sailed up the river 12 or 15 miles and left it on the 20th of the same month, calling it Columbia after his ship."

A second claim was based on the exploration of Meriwether Lewis and William Clark sent out with a party by the United States government, in 1804, across the newly-purchased Louisiana territory. They followed the Missouri River to its headwaters, crossed the Rocky Mountains, reached the Columbia River and followed it down to the Pacific. They encamped on the north side of the mouth of the Columbia, on Cape Disappointment, wintering there, 1805-06 and returned to Saint Louis in September 1806. "It was this important expedition which brought to the knowledge of the world this great river, the greater by far on the western side of the continent, with its numerous branches and the vast regions through which it flows above the point to which Gray and Vancouver had ascended."

Priority of settlement was claimed for the United States on account of the settlement made by the party sent out under the company of which John Jacob Astor was the head. "Early in the spring of 1811, they made their establishment on the south side of the (Columbia) river, a few miles above Point George." Great Britain took this post and others in 1812 after the beginning of war between the United States and Great Britain. By the first article of the Treaty of Ghent, 1814, which terminated the war, the posts were restored to the United States, the formal transfer occurring in 1818.

The United States last item of claim was based on the Treaty of Louisiana in 1803, with

France, and the Treaty of Florida in 1819, with Spain. By the latter, Spain conveyed to the United States all her rights, claims and pretensions to the country west of the Rocky Mountains and north of the 42d parallel. By the treaty of 20 Oct. 1818, between the United States and Great Britain, the boundary line between the United States and British America was fixed on the 49th parallel from the Lake of the Woods to the Rocky Mountains. West of the Rocky Mountains, the line was not defined, but it was agreed that the Oregon country with its harbors, bays and rivers, be open for the term of 10 years to the vessels, citizens and subjects of either power. The boundary was left unsettled and the agreement above specified was renewed in 1827, except that the time was left indefinite and the agreement terminable at the discretion of either power upon a 12-months' notice to the other. The country in question was a wilderness traversed by the hunters and trappers of the Hudson Bay Company and the Indians, the possession of which was not considered an issue of the first importance. In 1843 President Tyler's annual message called the attention of Congress to the Oregon boundary and stated the United States claim as embracing the country from the 42d parallel to that of 54° 40'.

The claims of Great Britain were similar to the claims of the United States. In 1778, the English Captain Cook visited and explored the northwest coast of America from latitude 44° northward. In 1792, 1793 and 1794 Captain Vancouver, for the English, surveyed the coast and its adjacent islands. In point of "accuracy and authenticity" these discoveries were said to be superior to those of any other country.

"In 1793, Mackenzie, a British subject, had crossed from the Rocky Mountains to the Pacific, exploring the upper waters of Fraser's River, which in process of time was traced to its junction with the sea near the 49th degree of latitude, thus forming in point of exploration a counterpoise to the exploration of that part of the Columbia which was first visited by Lewis and Clark." An English expedition intended to anticipate the Astoria settlement, was a little late, not reaching Astoria till July 1811. Great Britain denied the validity of the Spanish claim to the Oregon country, practically on the ground that she was so much stronger than Spain that Spain could not make good her claim. The above claims and counter claims, with various modifications, were discussed at times by the diplomatic representatives of Great Britain and the United States from 1826 to 1846.

The Oregon question as an issue in American politics was made prominent by a plank in the platform of the national convention of the Democratic party at Baltimore, the latter part of May 1844, which read, "resolved, That our title to the whole of Oregon is clear and unmistakable, that no portion of the same ought to be ceded to England or any other power, and that the reoccupation of Oregon and the reannexation of Texas at the earliest practicable period are great American measures which this convention recommends to the cordial support of the Democracy of the Union." The words reannexation and reoccupation implied that the territory in question had belonged to the United States, Texas under the Louisiana purchase and

Oregon by discovery, exploration, etc., till the United States left the claim to sovereignty over Oregon in abeyance by the convention of joint occupancy with Great Britain. It must be recognized that in 1844 the United States had no undisputed sovereignty over the territory on the Pacific Coast now belonging to the United States. Joint occupancy with Great Britain of the Oregon country was not sovereignty over it. The California country belonged to Mexico. If the sovereignty of the United States was to extend from ocean to ocean, that power must acquire the California country from Mexico or exclude England from Oregon. The settlement of the Oregon boundary had been discussed for some time previous to 1844 and it had been hoped that the treaty which was negotiated in 1842 between Mr. Webster and Lord Ashburton, fixing the line between Maine and Canada, would also fix the Oregon line; but such was not the case. James Buchanan, in a speech in the Senate, 12 March 1844, upon a resolution requesting the President to give notice of the termination of the joint occupancy of the Oregon country, pointed out clearly that England leased that territory to the Hudson's Bay Company in December 1821 for 21 years and in 1838 renewed the lease for 21 years more; that the Hudson's Bay Company had six permanent establishments on the coast, 16 interior and several migratory hunting parties, six armed vessels, one of them a steamer; that they hoped to keep British interests on the ascendant in the Pacific. Mr. Buchanan also showed that Great Britain was content to keep the *status quo* and that the only way to force her to act was to give the notice. The plank in the Democratic platform was considered decidedly aggressive in some sections of the country. As might have been expected, New England and the sections whose cities and shipping would be more at the mercy of the enemy in case of war were not so enthusiastic for an aggressive foreign policy as those States in the centre, west and south of the Union which were more remote from the "firing line" and which were deeply interested to see that the flag of the Union sweep through from "sea to sea." The discussions in Congress revealed calculation of the probabilities of war as the result of the notice. It was urged that Ireland was hostile to England and there might be a rebellion. Far more important was the fact that England received nine-tenths of her cotton from the southern United States; that war would cut off this supply and close the English mills with all the social distress involved, to say nothing of the loss of the markets the United States afforded for English manufactured products. In 1844, one-third of the foreign trade of the United States was with Great Britain. After Polk's nomination, it was brought out in the proceedings of Congress in June 1844, that so far back as the session of 1828-29, he had laid out a definite plan of policy for the United States including giving the notice and taking the consequences. When, therefore, Polk was elected in November 1844, the Democratic party considered its platform approved by the country and it proceeded to carry out its policy of territorial aggrandizement. The cry of "54° 40' or fight" phrased the ultra aggressive sentiment on the part of the United States looking to push its territory to the Russian line, while Great Britain seemed equally

determined to force the line of the Columbia River. War with Great Britain might involve the loss to the United States of all the Pacific Coast. Blaine in his 'Twenty Years of Congress' attributes the emergence from a difficult situation to the foresight and ability of Calhoun and of Buchanan. These gentlemen as well as Clay and Webster, when occupying the post of Secretary of State, had been willing to continue the line of 49° to the Straits of Fuca. There were serious objections to the Columbia River line. The most important of these, barring consideration of national honor and pride, was the fact that there were no good harbors in the territory left to the United States south of the Columbia, whereas, if the line ran, as it does at present, on the 49th parallel to the Straits of Fuca, all Puget Sound with its waters sheltered from the storms of the Pacific and its branches accessible to a very large territory, would belong to the United States. San Francisco harbor then belonged to Mexico. Within the United States, sentiment was divided. War with England would hurt the South seriously by cutting off her cotton market and possibly limiting what might become slave territory to the Southwest. The anti-slavery sentiment of the North had defeated Clay for the Presidency for his willingness to compromise on an issue on which it would brook no compromise. President Polk was a friend of General Jackson and peace was not an idol at whose shrine Jackson worshipped. The influence of other public men looking toward peace, their interests and rivalries, were to be considered. The Administration escaped from its "54° 40' or fight" position by taking the advice of the Senate in advance of the treaty. This course, unusual and in some cases highly undesirable, shifted the responsibility for action upon the shoulders of the Senate, at the same time allowing the Secretary and Great Britain to feel that the instructed action of the Secretary could not consistently be rejected by the Senate. It cleverly rescued the Administration, for if the Whigs insisted upon the line of 54° 40', they put themselves squarely upon Democratic ground. If they were willing to compromise on 49° for the sake of peace, it would hardly seem reasonable to taunt the Democrats with cowardice for acting upon Whig advice. When the resolution of notice passed the House in February 1846 "the country at once became alarmed by the growing rumors that the resolution of the House was a direct challenge to Great Britain for a trial of strength as to the superior title to the Oregon country." The resolution, amended by the Senate and given a conciliatory tone, passed Congress 23 April 1846. By that time the Administration must have seen its future course clear, for by the middle of June the diplomatic representatives of Great Britain and the United States had come to an agreement which was ratified by the respective countries and proclaimed in force in August 1846. The line agreed upon was the parallel of 49° to the Straits of Fuca, thence following the middle, roughly speaking of that Strait to the Pacific. War with Mexico broke out contemporaneously with the passage of the amended Oregon notice to Great Britain and as a result of the war with Mexico and the Oregon treaty with Great Britain, the United States acquired its present sovereignty over the great territory west of the

Rocky Mountains with a frontage of some 1,500 miles on the Pacific.

E. BENJAMIN ANDREWS,
Late Chancellor of *The University of Nebraska*.

OREGON ROBIN. The "varied thrush" (*Merula naxia* or *Ixoreus naxius*) which represents the eastern robin in Oregon and northward to Alaska west of the mountains. It is dark slate-blue above and orange-brown in the lower parts, with a crescent of black on the breast, from the horns of which a line of black leads along the neck and through the eye. It makes its nest in bushes and lays greenish-blue eggs, clearly marked with spots and points of dark brown. It is a sweet singer.

OREGON SNOW-BIRD. See SNOW-BIRDS.

OREGON STATE AGRICULTURAL COLLEGE, founded in 1870 at Corvallis. The four-years' courses include agriculture, domestic science, mechanical, electrical and mining engineering and pharmacy, there are also a two-years' course in mining, a two-years' business course (added in 1901) and a winter course of four to six weeks in agriculture, and a preparatory department with a one-year's course. The college is coeducational and there are women on the faculty. The 'experiment station is connected with the College, though separately supported, and farmers' institutes are organized under supervision of the faculty; in 1901, 11 such institutes were held with an attendance of 3,100. The income is derived chiefly from the land grant fund of 1862 and from Federal and State appropriation; tuition is free; in 1922-23 the annual income amounted to about \$1,661,825. In that year there were 4,548 students in attendance and 450 members of the faculty. The library is an excellent one.

OREGON STURGEON. See STURGEON.

OREGON TRAIL, an old emigrant route, about 2,000 miles long, extending from Independence, Mo., to Oregon City and Fort Vancouver on the Columbia River. It followed the valleys of the Kansas and Little Blue rivers to Fort Kearney, thence along the North Platte River, touching at Fort Laramie, through the Black Hills, touching at Independence Rock and Devil's Gate, thence into the Sweetwater River valley, through the Wind River Mountains, crossing the Big Sandy River and following the valley of the Bear River. To this point the trail was that used in reaching California, but a trail struck off to the southward at Soda Springs, and another slightly farther where the headwaters of Snake River were reached. The Oregon Trail continued along the Snake River Valley to Fort Boise, then northward across the Blue Mountains to the headwaters of the Columbia River, and along its course to Fort Vancouver, its course being practically that of the Union Pacific Railroad from the point of its touching Bear River. Across Nebraska the trail was indefinitely called "California," "Oregon," "Salt Lake" and "Mormon." An old Indian and buffalo trail, it was further defined by trappers and settlers and afterward blazed part of the way by Vérendrye in 1742; and more definitely routed by the Lewis and Clark expedition in 1804, and by an Astor party establishing fur-trading posts in 1810-12. The trail continued in use, some slight variations being made in it, and in the later 30's several missionary expedi-

tions passed over it; while in 1842 Frémont made the government survey of a route to the coast. From 1842 a constantly increasing tide of emigration poured over the trail. Efforts are now being made to have an automobile highway mark the course of the old trail. A map of the trail was published by the United States government in 1848, and others are in the 'American Nation Series' (XIV, XVII), and in the 'Quarterly of the Oregon Historical Society' (1900-01). Consult Parkman, F., 'The Oregon Trail' (1872); Meeker, E., 'The Ox Team, or the Old Oregon Trail' (1906); Frémont, J. C., 'Expedition to the Rocky Mountains' (1850); Bancroft, 'Oregon' (1890).

O'REILLY, ò-rí'li, **COUNT Alexander**, Spanish soldier: b. Dublin, 1725; d. Murcia, 23 March 1794. He entered the Spanish army when a boy, fought the Austrians in Italy, joined the Austrian army in 1757, and the French in 1759, and then returned to Spain. He served in the war with Portugal (1762), acted as governor of Havana, rebuilding the fortifications dismantled during the British occupation, was governor of Madrid during the rising of 1765. He was governor of Louisiana in 1769, and acted there with great severity until his authority was established, when he showed himself attractive and liberal. He commanded an unsuccessful expedition to Algiers in 1775, but still retained the king's favor. After the death of Carlos III (1788) he was disgraced and retired from the army; he was subsequently appointed to the chief command of the Spanish army in 1793, but died suddenly before reaching his army.

O'REILLY, Charles, Canadian physician: b. Hamilton, Ontario, 19 June 1846. He was educated at McGill University, and engaged in practice in 1867. He was resident physician at the Hamilton City Hospital in 1867-75; and was medical superintendent at the Toronto General Hospital in 1875-1905, where he was responsible for the improvements which made it the present model institution. He organized the Toronto General Ambulance Corps in the North West Rebellion of 1885; was an examiner in clinical medicine at the universities of Toronto and Trinity; and was the first Canadian on the consultant staff of the surgical department of the Sisters of Charity Hospital, Buffalo. He is recognized as a foremost hospital expert.

O'REILLY, John Boyle, Irish-American author and journalist: b. Dowth Castle, County Meath, 28 June 1844; d. Hull, Mass., 10 Aug. 1890. He was apprenticed to a printer at nine, became a compositor and a reporter and was an active member of the Fenian Society, in whose interests he enlisted in May 1863 in the 10th Hussars. Three years later he was tried for treason and sentenced to death, a sentence commuted to 20 years' penal servitude. From Dartmoor he was transported in 1867 to West Australia, whence he escaped in a boat furnished by the Rev. P. McCabe, and, having been picked up by the *Gazelle*, an American whaling ship, made his way to Philadelphia, where he was naturalized. He removed to Boston almost immediately, and became editor of the *Pilot* in 1870 and part owner in 1876. He accompanied the Fenian raid of 1870 as press correspondent, and was a prominent advocate of Home Rule for Ireland. He wrote some good verse, notably that

on Australian themes: 'Songs of the Southern Seas' (1873); 'Songs, Legends and Ballads' (1878); 'America' (1882), and 'In Bohemia' (1886); and in prose, 'Moondyne,' a novel dealing with penal life (1879); 'The King's Men' (1884, with Robert Grant, 'J. S. of Dale,' and J. F. Wheelwright); 'The Irish Question' (1886); 'Ethics of Boxing and Manly Sport' (1888), and 'Stories and Sketches' (1888). Consult Roche, J. J., 'Life of John Boyle O'Reilly' (Boston 1891).

O'REILLY, Robert Maitland, United States army surgeon: b. Philadelphia, 14 Jan. 1845; d. 1912. He was appointed a medical cadet in the United States army 7 Jan. 1864, and served through the remainder of the Civil War, taking his M.D. at the University of Pennsylvania in 1866. He was appointed assistant surgeon in the army in 1867, remained in the service and was regularly promoted, reaching the rank of surgeon-general in 1902. He served in the Spanish War in the volunteer service as lieutenant-colonel and chief surgeon, and in 1909 was retired with the rank of major-general. He served for a time as personal medical adviser to President Cleveland.

OREL, ô-rêl' or **ORLOFF**, Russia, (1) a town, capital of the government of same name, on the Oka, 238 miles southwest of Moscow. It consists of narrow streets and houses built principally of wood, and has manufactures of linen, tanneries, rope-works, worsted-mills, etc. It is well situated for trade, communication by water with the Black Sea, the Caspian, the Baltic, and forming an important entrepôt, especially for Petrograd and Moscow. Pop. about 91,051. (2) The government, bounded on the north by the governments of Smolensk, Kaluga and Tula, on the east by that of Voronezh, on the south by Voronezh and Kursk, and on the west by Tchernigov, has an area of 18,060 square miles, the surface being diversified with hill and valley, and watered by the Oka, the Desna, the Don and its tributary the Sosna. Stock-raising, the lumber business and agriculture constitute the chief industries. There is a considerable seasonal migration of the peasants to Petrograd, Moscow and southern Russia.

O'RELL, Max. See BLOUET, PAUL.

ORELLANA, Francisco de, frân-thês'kô de ô-rêl-yâ'nâ, Spanish explorer of the Amazon: b. Truxillo, Spain, about 1500; d. Brazilian Guiana, 1550. He was a friend and fellow-townsmen of Pizarro (q.v.), fought under him in Peru, founded the city of Guayaquil in 1537, and in 1540 accompanied the expedition across the Andes in search of El Dorado, and sailed down the Napo River with a few men to the Amazon, which he followed to its mouth, and, because of the stories he heard of women warriors and women chiefs along its course called it the Amazon. The voyage, which was beset with difficulties with natives and with mutiny, was completed in 1541. Upon his return to Spain he told amazing stories of the richness of the country he had explored and received its government in 1544. He died of malaria soon after his return to South America, where his expedition was entirely unsuccessful. Consult the contemporary account of his travels by his chaplain, Gaspar de Carvajal, reprinted at Seville in 1894, and 'The Voyage of Francisco de Orellana down the River of the Amazons,'

translated by C. R. Markham from the 'Historia general de las Indias occidentales,' by Antonio de Herrera, and published in the publications of the Hakluyt Society, Vol. XXIV (London 1859).

ORENBURG, ôr'en-bûrk', Russia, (1) a town, capital of the district of the same name, on a slope above the right bank of the Ural, 990 miles southeast of Moscow. It has spacious and regular but ill-paved streets. The principal buildings are two gymnasia, several stone churches, two mosques, a governor's house, exchange, custom-house, merchant house, abattoir and Bashkir caravansary. The chief manufacturers are woollens, partly for army clothing, leather and soap. There are also many large tallow-melting houses. The trade, carried on principally by caravans from Khiva and Bokhara, is very extensive. The chief exports are meat, hides, wool and dairy products. Pop. 93,600, comprising Russians, Kirghiz, Tatars and Jews. (2) An eastern district partly in Europe and partly in Asia, in the southern Urals, with an area of 73,254 square miles. The soil is in general good, but agriculture is very wasteful. The steppe to the east of the Urals, however, is barren. Stock-raising is an important industry. It has celebrated deposits of gold, platinum, copper, silver, coal, iron and salt, which are extensively worked. Pop. about 2,000,000, 70 per cent Russian, the rest Mohammedans, chiefly Bashkirs.

OREODONTS, an extinct family (*Oreodontidae*) of artiodactyl ungulates, the remains of which occur in the early Tertiary deposits of North America, and are among the most primitive of hoofed mammals. Their skeletons abound in the Lower Miocene formations of Colorado and northward, especially in the White River beds. They are mainly animals not larger than sheep, with a very long tail and with four functional toes on each foot. The dentition is usually complete, though the incisors are sometimes rudimentary or even wanting in the upper jaw; and all the genera exhibit, says Woodward, one very peculiar feature, namely, the degradation of the lower canine to the rank of an incisor, while the foremost premolar is enlarged to usurp its function in opposing the moderately larger upper canine. The best-known genera are *Oreodon* and *Agriochærus* of the eastern foothills of the Rockies, and the larger *Eporeodon* of the Pacific Coast. Consult Woodward, 'Vertebrate Palæontology'; Osborn, 'Evolution of the Ungulate Foot' (Trans. Amer. Philosophical Soc., U. S., Vol. XVI, 1889); Cope, 'The Artiodactyla' (*American Naturalist*, 1888 and 1889).

OREOPITHECUS, the generic name given to the oldest known fossil ape, fragments of whose skeleton (jaws and teeth) have been recovered from the Middle Miocene of Tuscany. They are interesting as exhibiting a comparatively large animal (*O. bamboli*), showing resemblances both to the *Cercopithecidae* and to the *Simiidae*, "as if," remarks Woodward, "they represented an annexed ancestral type."

ORESTEIA, The. 'The Oresteia' of Æschylus, the only Greek trilogy that has come down to us, is a tableau in which different stages of the same great action pass before our eyes, and in which the poet unfolds the long conse-

quence of a sin, as Schiller does in 'Der Fluch einer bösen That.' The first play, the 'Agamemnon,' is not only the poet's masterpiece; it is also one of the greatest tragedies in existence.

The scene opens at early morn in Argos. On the roof of the palace is the watchman looking for the beacon signal. He has been placed there by Clytemnestra, the spouse of the absent chieftain. We learn after a few verses that Troy has fallen. Most fearful conflicts are presented in the second play; but in the first the poet had another object—to get his audience in the right frame of mind. We are oppressed with a vague sense of many crimes at the very beginning. The watchman declares that he will be glad to see his lord again. More he will not say. If the house could speak it might tell much. The chorus of elders enter and take us back in their song to thoughts of the army, when Agamemnon 10 years before led forth the flower of Argive youth to Troy.

The queen comes forth to offer sacrifice, and the chorus carry us back in a dactylic strain to the sacrifice of Iphigenia, which gives the keynote to the catastrophe. Clytemnestra relieves the anxiety of the elders by announcing that the Greeks have taken Priam's citadel. The description of the relay of courier-torches is one of the most famous passages in all Greek literature. Clytemnestra now dwells on the images of prostrate forms and ransacked houses in Troy. The chorus dismiss her in a rather short and ironical commendation. The theme changes to the trouble brought on innocent people at home. The action gradually moves toward Argos. Suddenly a herald enters with direct tidings. He addresses all the gods and blends sad memories with the joy of treading his native soil again. Clytemnestra comes forth and addresses the messenger of her lord:

"Let him come quickly, loved of all the land,
And may he find the wife he left behind
Unchanged, still faithful."

Then the king comes. In his chariot is Cassandra, Priam's daughter. Agamemnon speaks grandly of his victory. His wife receives him with protestations of love and fidelity. Her expressions are exaggerated, because they are mendacious. But her joy is real—she has her victim. The king is not deceived by his wife's hypocrisy in her outburst of superabundant love. Reluctantly he enters the palace with that pomp which he feels is a challenge to the envy of the gods. Cassandra remains in the car. The chorus give expression to the fears that besiege their souls. Here the second part of the drama begins. The ode is brief, because the catastrophe is approaching. Clytemnestra comes out again for her second victim. But Cassandra heeds not her exhortations to alight, and impatiently the queen returns to the palace. The chorus urge the captive to descend; but the prophetess merely utters a wild cry: "Apollo, where hast thou brought me?" "To the house of the Atreidai," is the answer. "Ha! So it is—a house accursed. It could tell of many a bloody deed. There stand the witnesses—little children slaughtered for a meal. Their own father ate them—Ha! What wouldest thou do? She lifts her hand. In the folds of the mantle he is caught. He falls in the bath." The chorus believe the poor maiden is distraught—her words carry but half sense.

They marvel more and more, as she continues, and wonder how it will all end. The inspired virgin now sees and prophesies her own fate. Cassandra enters the palace. The chorus are overwhelmed with suspense. Then the death-cry of Agamemnon is heard. They take counsel excitedly. As they approach the gate, the back-wall of the stage opens and discloses the interior. On one side of Clytemnestra, in the bath, lies the corpse of Agamemnon enveloped in an embroidered web, on the other the corpse of Cassandra. The elders expected to meet Ægisthus. But it is their queen that stands before them. She does not flinch. Triumphant she stands with the axe in her hand and shouts exultantly how the deed was done. The elders declare that she is wondrous bold to boast thus. But the queen replies:

"This corpse, I tell you,
Is Agamemnon, once my lord;—his death
The work of this right hand, proud to have wrought
A masterpiece so righteous."

Clytemnestra is magnificent even in her crime, upborne by her indomitable will. The elders mourn the fallen king. But the queen haughtily commands them not to prate of dishonor—he but paid the price for Iphigenia's death. Suddenly Ægisthus enters with an armed retinue. He shouts with joy at the welcome sight: "Day of Vengeance, thou has come! Agamemnon's father set before my father, Thyestes, his own children to eat. Feet and hands were hewn off and concealed beneath bits of roasted flesh. Thyestes ate of the repast. When he was aware of the food, he spat it out, upset the table and uttered this curse: 'So fall the whole race of Pelops! This is the crime for which Agamemnon's death atones!'" The elders are faithful to their king and denounce the assassin. Ægisthus warns them not to kick against the pricks. Clytemnestra steps between the soldiers and the elders. The tragedy ends in the trochaic tetrameter which mediates between this play and the next, a prophecy of what is to come: the end is not yet—there is only a truce. Clytemnestra leads Ægisthus within: "We control the palace henceforth; what we will is law."

The 'Agamemnon' is a drama of crime. The 'Chœphori' (Libation-Bearers) is a drama of revenge. There is still an echo of the storm; and in the third play, the 'Eumenides,' the drama of propitiation, the thunder dies away and the stormcloud lifts.

An interval of 10 years separates the 'Chœphori' from the 'Agamemnon.' Menelaus is still absent. But Orestes, the son of the murdered king, returns to Argos at the bidding of the god at Delphi. An oracle of Apollo has charged him to slay his mother and avenge his father. He is resolved to do the deed even if the oracle be false. He is not, like Hamlet, prompted to his revenge by heaven and hell, but by Apollo and by his own feelings—he needs no visitation to whet his almost blunted purpose. Orestes enters with his inseparable companion, Pylades. Near the palace is the tomb of Agamemnon. After laying two locks of hair on the grave, the youth observes a train of women bringing drink-offerings to his sire. One of them is his sister, Electra. They sing a song, the burden of which is the blood that will not out, and they call for justice. Electra has been commissioned by her

mother (who had dreamed that she gave birth to a viper) to do what she dares not do herself. She plays only a secondary part in the play, but it is of great dramatic importance; and there are some touches of extraordinary poetic beauty. The young men have retired and watch the procession unobserved. Electra prays to her father to send Orestes that the murderess may die the death of retribution. As the chorus chant the dirge, she pours three libations, takes up the lock of hair, and in great excitement notes the resemblance to her own tresses. Her passionate sisterly love finds beautiful expression in the wish that the hair had a kindly voice. No one in Argos possesses locks of equal sheen. She cannot assert with absolute belief that the fair offering came from her dear Orestes; but now she observes the footprints, like her own, the same form of heel, the print and mould in general. Orestes comes forward and reveals himself. His sister hesitates to yield too hasty credence, but is finally convinced. The eloquent outburst, which Orestes cannot control, is truly dramatic. He calls upon Zeus to look down upon the fatherless brood of the eagle. The chorus remind them of their duty, and they concert measures for vengeance. That Apollo will not betray him, Orestes knows, for the god had threatened him with exile, if he did not pay the guilty back, in like coin, blood for blood. The most important thing is to secure the aid of Agamemnon's shade. Brother and sister approach the tomb and call on their sire to help them. Orestes kneels and prays that he may regain his sceptre.

There are 1,076 verses in the play, but not until we come to 560 do we see the plot on which the drama turns unfolded. An elaborate preparation for vengeance has been made; then the action is rapid and decisive. The only delay is when Clytemnestra begs for mercy.

Orestes bids Electra go within, while he and Pylades appear before the gates as strangers from Phocis. They knock. Clytemnestra in great pomp comes forth. Orestes tells her that her son is dead. She feigns sorrow and bids the attendants conduct the men to the guest's apartments. Then the queen bids the nurse, Kilissa, summon Ægisthus with all speed. Her rustic homeliness and grotesque but natural inconsecutiveness of speech form an effective contrast with the tragedy that impends. Her pithy but illiterate babble about Orestes' babyhood adds just the touch of nature desired to relieve the tension at the crisis. Ægisthus arrives and enters the palace. Soon his shriek is heard. The incestuous dog has met his doom. The chorus withdraw to avoid suspicion. Darkness comes on and the scene shifts to the interior. A servant rushes to Clytemnestra's door and calls. The queen appears. The delineation is slight, but the portrayal shows the same outline as in the Agamemnon. Even her defense, which to modern feeling is coarse, is in keeping with her unflinching shamelessness. She takes in the situation at a glance; the hour for final settlement has come. She orders the servant to fetch an ax. Orestes enters, leaving the door open, through which can be seen the corpse of Ægisthus. When Clytemnestra shrieks, Orestes draws his sword. Clytemnestra, baring her bosom, pleads with her son to forbear: "On this breast didst thou often rest in sleep, from these nipples suck the mother's

milk." But Pylades warns him not to forget Apollo's high command, and Orestes orders his mother to follow: "Here by the side of him you preferred to my sire the death-stroke will I give to you." "Woe is me! The viper stings that I bare and reared." "Thou sayest true. Fulfilled's thy dream of terror. Thy act was sin—come now and die, e'en if that be sin."

In this encounter of mother and son the dramatic interest of the trilogy reaches its highest point. Orestes is constant to his purpose. Unlike Hamlet, he needs no occasions to spur on his dull revenge, no examples gross as earth to exhort him.

The chorus sing an ode of exultation that justice has been done, and the scene shifts to the adjoining room, where two corpses are seen, Orestes standing near. Servants hold the net in which Agamemnon was entangled. A multitude of people assemble. Orestes bids the servants unfold the web, the witness of the vilest stroke that was ever presented to human eyes.

The end of the play, where Orestes' justification is interrupted by spasms of approaching madness, affords a scene which gives scope to the poet's peculiar powers—

"Streaked with his mother's blood, but striving hard
To tell the story ere his reason goes."

His act presses to his memory like damned guilty deeds to sinners' minds, as a legion of foul fiends environ him: "Ha! What are these? Women in dark mantles, serpents writhing round their heads. I must be gone!" "What fancy of the brain bewilders thee?" "It is they—the avenging spirits of my mother. Apollo! more and more arise. They drive me forth. I cannot stay!" Orestes rushes out, the chorus sings of the storms that have beaten against the royal house, and the play ends in painful uncertainty.

The 'Eumenides' is a drama of propitiation. It begins with the main catastrophe of the trilogy; hence the tumultuous rhythm in striking contrast with the 'Agamemnon.' The whole interest centres in Orestes. His grim pursuers, the Erinyes, form the chorus. They have chased their victim to Delphi and have been cast into a deep sleep by Apollo. Orestes, exhausted, crouches before the altar. The aged priestess stands before the temple ready to perform her daily duties. She enters, but returns in terror. An unexpected sight has driven her out. The interior of the temple is now disclosed. Apollo promises Orestes not to forsake him. Hermes conducts the fugitive and Apollo vanishes. The ghost of Clytemnestra rises and upbraids the sleeping furies. Their only answer is a snore. Again she chides, and they are aroused. Their aspect is so frightful that they almost create a panic in the theatre. Apollo drives the hideous creatures from his sacred temple, and the scene changes to the Acropolis at Athens. Many years have elapsed. Orestes kneels before the statue of Athena. He speaks as one whose guilt is mellowed by time. Trusting in Apollo, he awaits the final verdict. The Erinyes range themselves in the orchestra chanting a song of vengeance. They are tracking their victim to his doom. Athena enters and bids her strange guests disclose their mission. The goddess resolves to establish the court of the Areopagus for trials of homicide. The herald proclaims silence. Athena takes her seat as presiding judge. The Erinyes accuse

Orestes, who admits his guilt, but justifies his act and calls on Apollo to testify. When both sides have been heard, the jurymen cast their ballots secretly, Athena openly. The votes are found to be even. Athena pronounces Orestes free. But his accusers, the *primæval* deities, are enraged because they are thus trampled down by younger gods. Athena allays their wrath, and they agree to remain in Athens; they will bless the people, become *Eumenides* (Gracious Goddesses). Athena places herself at their head and conducts them in solemn procession to their new home in a cavern below the Areopagus.

The satyr drama, which concluded the tetralogy, was the 'Proteus.' We know nothing about the structure of the play.

The 'Oresteia' received the first prize, was recognized at once as a classic and has never lost this distinction. It forms the high summit of the dramatic work of Æschylus, who will live forever as one of the most sublime poets of the world and as one of the greatest tragedians.

JOSEPH E. HARRY,
Author of 'The Greek Tragic Poets,' etc.; Lecturer on the Greek Drama at the Sorbonne.

ORESTES, ô-rës'têz, in Greek mythology, the son of Agamemnon and of Clytemnestra. Saved by his tutor with the assistance of Electra from the fate of his father, who was murdered by Ægisthus, Clytemnestra's paramour, Orestes was brought up in the house of his uncle Strophius, Prince of Phocis, and formed with his son Pylades that intimate friendship which has become proverbial. Called upon by the Delphian god to avenge his father, he hastened back to Mycenæ. To conceal himself he has recourse to artifice. His tutor and Pylades appear with an urn, which they pretend contains the ashes of Orestes. Clytemnestra hears the news of her son's death with a joy which she can hardly conceal; but she soon falls under his dagger. Ægisthus undergoes a similar fate. According to the Greeks, the murderer of his mother became a prey to the Erinyes or Furies. These terrible goddesses unrelentingly pursue the unhappy prince, and at last drive him to madness. From this, according to one story, he is released by worshipping the Furies, as the Eumenides (the Kindly), while according to another, told in Euripides, he was ordered to convey the statue of Artemis from Tauris to Athens. In fulfilling his injunction, he meets with further adventures.

ORFILA, ôr-fê-lâ, Mathieu Joseph Bonaventure, French chemist, founder of the science of toxicology both in its therapeutic and legal bearings: b. Mahon, Minorca, 24 April 1787; d. Paris, 15 March 1853. He served in the merchant marine, studied medicine at Valencia, Barcelona and Madrid; was sent to Paris by the Spanish government in 1807; and after the loss of his pension consequent on the war between France and Spain lived there in poverty for a time. By 1811 he had become doctor of medicine, and his successful practice and marvelous knowledge of chemistry made him quickly famous. He was naturalized, became professor of toxicology (1819) and of chemistry (1823), and was dean of the medical faculty from 1830 to 1848. He was famed as an expert witness, did much to reform French medical

education, and wrote 'Traité des poisons' (1813); 'Eléments de chimie médicale' (1817); 'Leçons de médecine légale' (1821-23); 'Recherches médico-légales et thérapeutiques sur l'empoisonnement par l'acide arsénieux' (1842).

ORFORD, ôr-fôrd, Earl of. See WALPOLE, SIR ROBERT.

ORGAN, a functional part of a living being. It is an essential quality of a living being (see LIFE) that it shall exhibit activities, the expression or product of organic constitution. Hence, any living being either vegetable or animal is termed an organism—the broadest possible name for the animate world as opposed to the inanimate.

Nature of Organs.—Organs may be spoken of in two senses. In common speech they are large functional parts of gross anatomy, such as roots, leaves or blossoms of plants, the limbs, the heart and blood-vessels, the lungs, the stomach, the liver and excretory glands, the generative parts, etc., of animals; these are termed, properly enough, the respiratory, digestive, locomotive or reproductive organs, and so on. But each is made up of many parts, which unite to effect the great functions that characterize the group as a whole, and all are more or less interdependent. The number and diversity of these structures, large and small, visible and invisible, vary enormously in different plants and animals, and are the result of an organic evolution, that is, a struggle for existence among organs, or intra-evolution, as it has been termed by some German naturalists.

Degrees of Organization.—Where the organs are few and simple, in some cases more than one distinct function being performed apparently by the same part, the animal or plant is said to be of simple or synthetic structure or organization; where the subdivision of labor in the organism is extensive, separate structures doing each a more particular work for the benefit of the whole, the organization is said to be complex or specialized. Increase of specialization is regarded as an advance, hence we speak of "lower" and "higher" animals, referring to the less or greater degree of complexity and specialization of their organs. Comparison of existing organisms, considered with reference to their activities, and a study of the phylogeny of animals and plants as revealed by palæontology and embryology, establishes the truth of this standard of comparison, and throws light upon the evolution of organs. Tracing backward any particular group, as, for example, that of the digestive system, we find it less and less complex as we descend the scale of organization until we arrive at the simplest forms—the one-celled moners, which have no structure that our power is able to detect, the drop of undifferentiated protoplasm which constitutes their whole being accomplishing all the work of nutrition, locomotion and reproduction. A little higher stands the *amœba* (q.v.), and other protozoans and protophytans, in which a beginning of differentiation and structure appears in the presence of a nucleus, a vacuole, microsome, etc. Still higher stand the sponges, coelenterates, and so on, whose comparative superiority is manifested by the assignment of certain parts with gradually in-

creasing definiteness to perform distinct offices. But the higher organisms primarily differ from the lower ones only in the fact that they are composed of many cells in more and more complicated arrangement, while the lowest consist of only a single cell; hence in the last analysis, an organ can be defined only as a cell or group of cells devoted to doing a special part of the labor required for the continued life, activities, and prosperity of the organism. This is only a corollary of the general doctrine of the cell as the seat of life. (See CELL). Of the origin of function or organic activity we know nothing.

Form and Symmetry.—Returning now to the ordinary sense of the word "organ" as a functional part, certain general facts may be considered. Among these are the form and symmetry of organs. The form is determined by the work to be done, the organ as an instrument assuming that shape and relative position in the body, and acquiring that structure, which will be most effective for the purpose. Many of the problems here which seemed so difficult to early investigators have been solved by the application of mechanical laws. Mechanical principles, controlling, to begin with, the original cell-division of the egg, and regulated in growth by external conditions, as gravity, air or water pressure, strains, muscle-leverage, etc., are no doubt at the basis of the symmetry which so remarkably characterizes the arrangement of organs throughout the living world. Two general types may be recognized—radial symmetry and bilateral symmetry. The former is most characteristic of plants, where the majority of organs occur in circles around an axis (see PLANTS, STRUCTURE OF; FLOWER; PHYLLOTAXIS, etc.); and of such animals as the echinoderms, coelenterates and many worms, whose organs are radially disposed about an oral-aboral axis, as in polyps and starfish. The superior orders generally, and the arthropods and vertebrates particularly, display bilateral symmetry in a marked degree in all their outward parts, the external organs being in pairs (with one important exception in the higher forms) and these approximately, though not absolutely, alike. The internal organs of the vertebrates are by no means symmetrical at present, although they seem to have reached their asymmetry by evolution from a primitive paired condition. In insects and arthropods generally the internal parts show much bilateralism. Among mollusks the bilateral arrangement of the organs is normal, but one side is often developed at the expense of the other, even to the complete loss of the latter.

Correlations.—As might be expected under such circumstances certain definite correlations exist between organs as to size and relative proportions. Thus in the human frame, the limbs are equal in length, the head is one-seventh of the total height, the internal organs must be of a relative size in respect to one another and to the frame, and so on. The symmetry and correlation of organs is necessary to the continuance of healthful interacting functions.

At the same time homologous parts—that is, those structurally alike—may vary greatly among animals of the same class, according to the varying requirements of habits and environment, as for instance among vertebrates, the locomotive organs are in the form of fins or paddles for aquatic species, wings for aerial crea-

tures, and legs and feet for those of terrestrial habit; and these may be vastly modified among the different groups, adapted to diverse habits, giving all the difference, for example, between the massive, shovel-like, digging-paws of the mole and the long slender legs of the antelope, or even the total disappearance of homologous parts, as in the snakes and limbless lizards. Such alterations of form adaptive to the requirements of environment and habit come about gradually, and are likely to require a corresponding change in other organs, directly or indirectly; since all or many organs in the frame are dependent upon the coaction of others, and conditions of space, gravity, etc., require mechanical as well as physiological conformity. The stomach, lungs, etc., of a long slim animal will be elongated and narrow, while those of a related but more compactly built species will be more globular. Sometimes, however, the changes render some secondary organ unnecessary, and its continual disuse results in its gradual reduction and perhaps extinction, as has happened in the case of the loss of eyes by many burrowing or cave-dwelling animals. When such a loss has become permanent in a type the remains may occur only in the embryonic stage, or may exist in adulthood, quite useless to the animal in its present condition. Such obsolete structures, of which the false hoofs of many ungulates, the "balancers" of flies and the appendix vermiformis in man are examples, are called vestigial organs, and were most difficult of explanation until this relationship was recognized.

Function Change.—Organs may not only change their form, but may also change their function. Many perform more than one function, even in the higher animals, and often, especially in the case of the limbs, this has produced a change of form as between the fore and hind limbs, relegating to one pair, say the hind limbs, the main work of progression, while the other pair assist in this respect only a little, but serve mainly as the means of seizing and holding food; most of the rodents afford examples of this case, of which the kangaroos and the extinct iguanodons are extreme instances. But function-change has often been more radical, the original or primary service by an organ having been completely superseded by some other service, to accomplish which the organ underwent gradual transformation in accordance with change of habit and the arising of a novel bodily need to which existing machinery could be adapted. The origin of lungs in air-breathing amphibians, reptiles and warm-blooded mammals and birds is directly traceable to the transformation for this new purpose of the swimming-bladder of fishes; teeth came into existence as a relic of the hard scales of ancient fishes whose function was purely as an armature, the structure and office surviving only in a few such forms as the gar (see GAR); the three pairs of "jaws" of crabs are structures which, in the early history of the crustacean type were primarily swimming and breathing organs, but long ago lost those functions altogether and became fitted wholly for mastication of food. Similar examples in great number might be drawn from both animals and plants. Indeed, it might be said that most if not all of the successful and persistent variations have involved change of function on the

part of organs, the result of which in many cases was greater specialization.

For development of organs in the embryo see EMBRYOLOGY. See also ANATOMY; PHYSIOLOGY.

ERNEST INGERSOLL.

ORGAN (Gr. *ὄργανον*, Lat. *organum*, an instrument), a name applied to several musical instruments that are in construction and principle somewhat closely allied; but more distinctively appropriated to the largest of these, the pipe-and-pedal organ, which may be briefly described as a wind instrument, the sounds of which are those of a great number of pipes of varying lengths. The sounds are produced by the admission to the pipes (as determined by the keys and stops moved by the performer) of compressed air conveyed to them along certain channels, from a bellows worked by electricity, hydraulic, human or other motive power. From its essential feature of construction the pipe-and-pedal organ, is incomparably the noblest and most imposing of musical instruments, being in majesty of tone and grandeur of orchestral effect, produced by a single performer, without a parallel. As in the human voice, the tones of the organ are produced by the vibrations of the air in the tubes or pipes through which it is propelled. The three essentials of an organ are (1) a chest of compressed air; (2) sets of pipes in communication with this chest; and (3) a console of claviers or keyboards, by means of which this communication may be opened or closed at pleasure. The air is forced into the wind-chest by means of bellows or electric fans. To the upper part of each wind-chest is attached a sound-board, a contrivance for conveying the wind to any particular pipe or pipes at pleasure. It consists of two boards laid horizontally. On the upper board are arranged parallel rows of pipes, the pipes in each row, regarded longitudinally, being of the same timbre or quality of tone, but of a different quality when regarded laterally, that is, as they extend backward. Under each lateral row of pipes there is a groove or channel in the sound-board for the passage of air from the wind-chest to the perforations in the sound-board by which the pipes communicate with the grooves. Air is admitted into these grooves by means of valves or pallets, which are connected with the keys. On the depression of a key the valve is opened, and the compressed air rushes into the groove, and would, it is obvious, cause all the pipes communicating with that particular groove to sound their respective notes were it not for the register. The register is a slider which moves in other grooves in the sound-board, cut at right angles to those above mentioned, and communicating by perforations with the longitudinally arranged pipes; it contains holes to correspond with these pipes. By drawing the register or stop the holes of one of these rows are opened, as then the holes of the slider are directly under the entrance to the pipes, and by pushing it they are closed. From this it is clear that by drawing several of these registers corresponding rows of pipes are opened. When a register is open air can be admitted into any of the row of pipes under which it is placed by simply pressing the key that opens the valve of the groove with which it communicates. The

series of pipes above each slider is called a stop. The principal stops of an organ are the open, stopped and double diapasons; the principal, dulciana, twelfth, fifteenth, flute, trumpet, clarion, bassoon, cremona, oboe and vox humana. Those pipes of the various registers that open into each channel are so constructed that while one shall give a fundamental note, the others shall give the chords of that note. An organ may have several wind-chests filled by the same bellows, and several keyboards, each keyboard and wind-chest representing a distinct organ. In the largest instruments the number of these organs generally amounts to five. The most powerful of these is called the great organ; a smaller one the choir organ; another is called the swell organ, from the circumstance of its being enclosed in a wooden

box with a front of louvre-boards, which can be worked by the player so as to give diminuendo and crescendo effects to the sound; a fourth is called the solo organ, being employed for special solo stops, such as the hautboy, the flute-stop, the vox humana and others; lastly, there is the pedal organ, so called from its keyboard being played by the feet. The keyboards for the hand are termed manuals, that for the feet the pedal. The most usual compass of the manuals is from CC (8 feet)* to F in alt, four octaves and a half; that of the pedal from CCC to E or F, two and a quarter to two and a half octaves.

There are two kinds of organ pipes—flute pipes and reed pipes, of each of which there are several species. Flute pipes consist, first, of a foot, which is hollow, and receives the wind that sounds the pipe; second, of a body which is attached to the foot. Between the foot and the body of the pipe is a diaphragm or partition, having a small narrow aperture to let out the wind; over this aperture is the mouth, whose upper lip, being horizontal, cuts the wind as it escapes through the aperture and sets it in vibration, so causing the sound. The pipes are made either of pewter, of lead mixed with tin, or of wood. The metal pipes are generally cylindrical, open at their extremities and clear in their sound. The wooden pipes are square and generally stopped at their extremities by a plug covered with leather, so as to be air-tight. The sound of these is softer. The longest pipes yield the gravest, the shortest, the most acute sounds. The pipes, however, which are stopped have only half the length of those that are open, for the same sound. The pipes vary in length from 32 feet or so, to the

size of the pipe of a very small key. The reed pipes consist of a foot to carry the wind to the reed, a thin tongue of hard brass, one of the extremities of which is fitted into a kind of mold by a wooden plug, and the other is left free to vibrate; and in proportion to the length of that part of the tongue which is at liberty is the depth of the sound. After passing the reed the wind traverses a long pipe, whose dimensions and shape give character and quality to the sound.

The hand or barrel organs consist of a movable, turning cylinder, called a barrel, on which, by means of wires, pins and staples, are set the tunes it is intended to perform. These pins and staples, by the revolution of the barrel, act upon the keys within, and give admission to the wind from the bellows to the pipes. The hand-organ is generally portable, and so contrived that the same action of the hand which turns the barrel gives motion to the bellows.

The invention of the organ is attributed to Ctesibius (q.v.) of Alexandria, about 200 B.C. An organ was presented by Emperor Copronymus to Pepin, king of France, about 755; and in 826 a water-organ was erected at Aix-la-Chapelle. The use of organs, however, was not common before the 14th century. At the beginning the instrument was very imperfect; it had only from 12 to 15 broad and large keys, which were struck with the fist and produced the tones of the diatonic scale. The keys in time became smaller, and between the diatonic tones the semi-tones were inserted. In 1444 H. Drossdorf of Mayence built a great organ with a pedal. According to others, Bernhard, a German, organist to the Doge of Venice, built the first organ with a pedal between the years 1470 and 1480. Improvements succeeded quickly in the 16th century; the division of all the pipes into different stops was now invented, and the tone of the instrument was adapted to the tone of the choir. The bellows were particularly improved when Christian Forner in the 17th century invented the windchest, by which an equal pressure of wind is obtained in all the bellows. Till then 20 to 24 pairs had often existed in one organ, requiring from 10 to 12 men to tread them. Later, hydraulic engines and electric motors were adapted to the purposes of working the bellows, and in many of the most modern organs, electric fan-blowers, supplying specially constructed air-chambers, have supplanted bellows. The adaptation of venetian shutters to increase or reduce the tones of pipes enclosed in a box and called the swell, was due to an English builder, Abraham Jordan, who introduced the idea in 1712. Another Englishman, C. S. Barker (1806-79), inventor of the pneumatic lever, patented in 1863 a contrivance for utilizing electric mechanisms. From both of these, with considerable improvements, the tubular-pneumatic and electro-pneumatic actions have developed, giving a wonderful facility of touch and response to the 20th century pipe-organ, compared to the several pounds pressure which were required to force down any single key of the tracker actions of the older-type organs. The standard radiating convex and concave pedal board, compared to the old straight pedal board, also increased facility of pedal execution. The adaptation of the pneumatic action to the old draw stops and their combinations, which in modern organs are

replaced by tilting tablets and push-buttons, has also facilitated digital technique. The profession of organist, formerly confined to men owing to the great physical strain imposed, has thus been opened to women. Chief among inventors of recent date who contributed to these improvements are Robert Hope-Jones (1841-1914); John Austin who in 1894 invented the universal air-chest; and Cousans who invented the kinetic fan-blower; both of which have supplanted the bellows. The wonder excited by the famous organs of former centuries has largely disappeared, through the familiarity of modern days with the splendid creations to be found not only in churches, but in civic and concert halls, in department stores, theatres and other places of amusement of large centres of population. Also by the instruments of exquisite tone and ornate appearance, installed in the homes of wealthy patrons, a specialty with certain organ-building firms. The perforated paper roll, accurately recording the technical performances of accomplished organists by ingenious adaptation permits these organs to be played mechanically. For secular purposes, pipe-organs also are frequently provided with orchestral percussion stops, to reproduce the sounds of chimes, glockenspiel, triangle, drums, etc. Since the beginning of the 20th century, American built pipe-organs have taken foremost position among the best produced in the world, and in 1914 there were 85 organ manufacturing in the United States employing over 3,000 persons; the gross value of their products for that year was \$6,297,000. For modern developments in organ construction consult Miller, G. L., 'The Recent Revolution in Organ Building' (New York 1913); also consult Audsley, G. A., 'The Art of Organ-Building' (2 vols., New York 1905); Broadhouse, J., 'The Organ Viewed from Within' (New York 1914); Cellier, A., 'L'orgue moderne' (Paris 1913); Clarke, W. H., 'Standard Organ Building' (Boston 1913); Dixon, 'Practical Organ Building' (London 1887); Hinton, H., 'Organ Construction' (London 1900); Lewis, W. and T., 'Modern Organ Building' (London 1911); Locher, C., 'Dictionary of the Organ' (New York 1914); Matthews, J., 'A Handbook of the Organ' (London 1897); Statham, H. CHARLES LEONARD-STUART,

Editorial Staff of *The Americana*.

ORGAN BIRD, a name applied to two different birds. (1) The Tasmanian crow-shrike, *Gymnorhina hyperleuca*, which has a single clear note and is sometimes taught to whistle or mimic. (2) The Amazonian wren, *Cyphorhinus cantans* is noted for its flute-like song.

ORGAN MOUNTAINS, or **SERRA DOS ORGÃOS**, Brazil. See **ORGÃOS**, **SERRO DÓS**.

ORGAN-POINT, or **PEDAL-POINT**, a musical term derived from the mediæval *organicus punctus*, and applied to the single tone, usually the tonic or dominant, held or maintained by one of the voice parts, while the other parts move freely, without reference to the sus-

tained tone, except at the beginning and the end of the passage. In modern composition the organ-point is usually in the bass, hence the alternative term pedal-point, the organ pedal being best adapted to sustain the long note. When an organ-point occurs in any other part than the bass, it is said to be inverted, and if in the soprano is called the "holding-note," this term being also of mediæval conception and the origin of tenor from *tenere*, to hold, the voice by which the *organicus punctus* was generally sustained to an effective contrapuntal climax. In many modern compositions, especially pastorales, a double-organ or pedal-point on both tonic and dominant is frequently used. The prelude to Wagner's 'Rheingold' contains the longest organ-point ever scored and consists of 138 bars.

ORGANIC CHEMISTRY. See CARBON COMPOUNDS.

ORGANIC SENSATIONS. See SENSATION, ORGANIC.

ORGANO-METALLIC COMPOUNDS, in chemistry, compounds consisting of an organic radical in combination with a metallic base. The alkyl radicals—methyl, CH_3 ; ethyl, C_2H_5 ; propyl, C_3H_7 ; etc.—are the most familiar examples of organic bases which enter into combinations of this character; and zinc, lead, tin and mercury are the most important metallic elements which combine with them. Zinc-ethyl, $\text{Zn}(\text{C}_2\text{H}_5)_2$, may be prepared by the action of metallic zinc upon ethyl iodide, $\text{C}_2\text{H}_5\text{I}$. A non-volatile, crystalline compound having the formula $\text{C}_2\text{H}_5\text{ZnI}$ is formed at first, but under the influence of heat this decomposes into iodide of zinc and zinc-ethyl. As thus prepared zinc-ethyl is a colorless liquid, which boils at 244°F . When exposed to the air it takes fire spontaneously, burning with a greenish flame. It may be converted, by slow oxidation, into ethylate of zinc, $\text{Zn}(\text{OC}_2\text{H}_5)_2$. Three compounds of ethyl and tin are known, and two compounds of ethyl and lead. Boron and silicon form compounds with ethyl, and these, although they contain no metal, are also called "organo-metallic" bodies. Silicon-ethyl has the formula $(\text{C}_2\text{H}_5)_4\text{Si}$, and may be prepared by treating zinc-ethyl with silicon-tetrachloride. It is a colorless liquid, boiling at 302°F . Several of its derivatives have a considerable theoretic interest, among these being a substance which has the formula $\text{SiC}_2\text{H}_5\text{O}$, smells like camphor and behaves, chemically, like an alcohol. Sodium-ethyl has not been isolated in the pure state, but a double compound of this substance and of zinc-ethyl has been prepared, having the formula $\text{NaC}_2\text{H}_5 + \text{Zn}(\text{C}_2\text{H}_5)_2$. The organo-metallic compounds, especially those of magnesium, are extremely useful for purposes of chemical synthesis. See also GRIGNARD REACTION.

ORGANOTHERAPY, or OPOTHERAPY, the medical use of animals' organs or glands, or of their extracts. The use of the extracts of many of the viscera of lower animals for their remedial effects in illness is of great antiquity. The savage who ate the heart of his courageous enemy had an inkling of a truth, even if the results were obtained only by what is now termed contagious magic, a form of animistic thinking. Ancient Chinese,

Indian, Greek and Roman medicine dealt largely with the fancied effects of eating certain organs, but it has only been within the era of exact physiological chemical methods that physicians have been in a position to apply the principles of organotherapy along rational and individual lines. As Paracelsus was the first to show that it was not the entire drug that was valuable, but that each drug contained some active principle to the action of which its effects were due, and thus was the forerunner of the distinctly modern school of "active principles," so Brown-Séquard, who maintained (1869) that each organ of the body had an internal secretion which was an active agent, was the founder of the modern school of organotherapy. The full applications of these general truths are far from being in sight, especially when one considers the recent developments of knowledge concerning specific cytotoxins, cytolytins, etc. Claude Bernard may be said to have antedated Brown-Séquard when he discovered the glyco-genic function of the liver; but Brown-Séquard, with more brilliancy and fancy than fact, made the broad application that all the glands of the body—liver, spleen, suprarenals, kidneys, testes, thyroids, ovaries, etc.—possessed internal secretions which passed into the blood and lymph and thus contributed to the metabolism of the body. Subsequent study has not borne out his theory, but it is known that certain glands and organs of the body do contain substances which are found only in those particular glands and organs, and which, extracted from the corresponding glands in the lamb, sheep, pig, cow, etc., and used hypodermatically, or by the mouth, have marked physiological actions and may be employed in therapeutics. Many of the extracts first devised by Brown-Séquard are now known to be worthless, particularly the extracts from the testicles of the ox and ram, which were to invigorate the old, and extracts of the brain, of the ovaries and of the mammary glands. All of these contain well-known compounds which are present in most of the tissues of the body, and beyond possessing certain tonic properties, such as a good beef-tea would possess, their action is nil. Later study has shown, however, which of the organs contain practicable therapeutic principles, and further research will undoubtedly reveal others, and may discover some in the organs now rejected as containing nothing specific. The most important of these substances now used in medicine are derived from the liver, the stomach, pancreas, thyroids, thymus, suprarenals, pituitary and sexual organs of the more common domestic animals. Of these the digestive ferments pepsin and pancreatin, alpha iodine compound, thyroid, epinephrin from the suprarenals, and spermin from the testicles are the most important. The action of the digestive ferments is discussed under digestion (q.v.).

The peculiar symptoms that resulted from the taking out of the thyroid gland in men and animals drew attention to this organ and its effects on secretion. The close resemblances of certain diseased persons to man and animals, deprived of this gland was noted, and it was soon established that myxœdema and cretinism (q.v.), two hitherto intractable diseases, were really due to diseases of the thyroid function. It was but a step, after finding the cause, to

apply the remedy, thyroid extract, and these two previously hopelessly incurable diseases became amenable to treatment. At first fresh glands were used; later, extracts; still later, the active principle, called by a variety of names iodothyron, thyroiodin, thyreoglobulin, etc. Thyroid extract causes, in addition to its effects in metabolism, a fall of blood-pressure through dilatation of the blood-vessels, and a slight depressing action on the heart in large doses. It also increases the nervous irritability of the heart-muscle by reason of its action on the vagus nerve. Small doses of the drug administered during a considerable period of time cause symptoms comparable to exophthalmic goitre (q.v.). The diseases for which it is used are cachexia strumipriya, following surgical removal of the thyroids; goitre of the hyperplastic follicular variety, a form which is associated with diminished formation of thyroid substance; myxoedema, sporadic cretinism; certain obscure skin-diseases and obesity. It is also used as a general metabolic stimulant. Within a few years an extremely active and powerful substance has been discovered in the suprarenal glands. It has received various names, suprarenin, adrenalin, etc., all of which are closely allied products that represent as nearly as possible the active principle or principles of this gland. This substance in the human body is probably of great importance in maintaining the tension of the blood-vessels, and it also bears some relation to the sugar-oxidizing properties of the liver or pancreas, or both. The effects of adrenalin, used hypodermatically, are immediate. It causes a marked rise in the blood-pressure, due to its stimulating the mechanism that constricts the blood-vessels; it slows the heart and causes it to beat more strongly; it depresses the breathing centres somewhat, dilates the pupils and slows down the peristaltic movements of the intestine. In medicine it is extremely useful as a local application to constrict blood-vessels, lessening hemorrhage, reducing inflammation, stopping discharges of the mucous membranes. It is thus particularly valuable in sore throat, running from the nose, inflammation of eye, hemorrhage from the nose or from the stomach. It has a certain value in some forms of diabetes, especially in bronzed diabetes, in rachitis, in spasmodic asthma and in the treatment of shock of any description, particularly if associated with loss of blood-pressure. The use of the active principle of the suprarenals is only just begun.

The pituitary gland contains a number of substances which exercise quite remarkable influences on bony and fatty growth. Furthermore the pituitary stands in close relation to the thyroid and suprarenal glands. All of the endocrinous glands stand in very close relation the one to the other. All organotherapy should consider the interaction of the various glands.

In the sexual glands substances rich in nucleins and phosphorus are present. Many of these have received names, but few have been isolated in sufficiently pure form to be useful in therapeutics. Those that are now available stimulate metabolism, and some are of value for counteracting the undesirable effects of the removal of some one of the organs of generation, as in castration or in ovariectomy. Consult Jelliffe and White, 'Diseases of the

Nervous System' (3d ed., 1919). See POLY-GLANDULAR ENDOCRINOPATHIES.

SMITH ELY JELLIFFE, M.D.,
Editor of 'Nervous and Mental Monograph Series.'

ORGANZINE. See SILK AND SILK INDUSTRY.

ORGÃOS, Serra dos, sār'rā dōsh ôrgownsh', or **ORGAN MOUNTAINS**, Brazil, a portion of the Serra do Mar cordillera, 40 miles northeast of the city of Rio de Janeiro, so called from their resemblance to the pipes of a church organ, as viewed from the sea. The highest peak is 6,500 feet.

ORGAZ, ôr'gās, Francisco, Cuban poet: b. Havana, Cuba, 1815; d. Madrid, Spain, 1873. He was educated in Havana, entered journalism and in 1839 went to Madrid where he took up his residence. His first volume of poetry, 'Preludios del Arpa' (1841), won for him recognition as one of the best lyrical poets of Spanish-America; he also wrote two dramas and several historical works besides a second volume of verse 'Las Tropicales' (1850).

ORGETORIX, ôr-jêt'ô-riks, Helvetian chief: d. about 62 B.C. He was a man of vast wealth and power and intrigued to gain sovereign power, endeavoring to persuade the Helvetii to emigrate to Gaul. His designs were suspected and he was brought to trial, but died, supposedly by his own hand, before a decision was rendered. Consult Cæsar's 'Commentaries,' Book I, and 'Dio Cassius,' xxviii, 31.

ORGIES, ôr'jis, or **ORGIA**. See BACCHUS.

ORIANA. (1) The mistress of Amadis de Gaul, the legendary hero of mediæval chivalry. According to romance she was the daughter of Lisuarte, the English monarch. Queen Elizabeth was often styled "The peerless Oriana" in the complimentary poems of her day. (2) The chief personage in Fletcher's comedy, 'The Wild Goose Chase' (1621), and in Farquhar's comedy, 'The Inconstant' (1702). (3) A character in Beaumont and Fletcher's play, 'The Woman Hater' (1607). (4) The title of a poem by Tennyson in which the name is introduced as a constant refrain (1830).

ORIANA, The Triumphs of, the title of a book of madrigals composed in honor of Queen Elizabeth, which Thomas Morley compiled and printed in 1601.

ORIANI, ô-rē-ā'nē, Barnaba, Italian astronomer: b. Garegnano, Italy, 1752; d. 12 Nov. 1832. He was ordained to the priesthood, studied astronomy under Lagrange, assisted Reggio and De Cesaris in measuring the arc of the meridian, and his calculations proved Ceres, which Piazzi discovered in 1801, to be a planet, not a comet as Piazzi had supposed. He was director assistant in Brera Observatory at Milan in 1802 and was editor of the 'Effemeridi Astronomiche' in 1778-1830. He was created a count by Napoleon and published 'Tables of Uranus' (1785); 'Spherical Trigonometry' (1806), etc.

ORIBASIUS, ôr-î-bā'shî-ûs, Greek physician to the Emperor Julian the Apostate: b. Pergamon (or Sardis) about 325 A.D.; d. about 400. He studied in Cyprus under Zeno, became attached to Julian during the Oriental exile of the latter, accompanied him to Gaul, and,

after his accession in 361, was appointed quaestor of Constantinople. But after Julian's death, when the Christians again obtained the upper hand, he was banished among the Danubian barbarians. He was recalled during his last years. Oribasius is reputed the first to describe the salivary glands. Under Julian's direction he summarized the medical lore of the day. A Latin version of the 6th century has been edited by Bussemaker, Daremberg and Molinier.

ORIEL COLLEGE, Oxford, England, founded in 1326 by Edward II on the suggestion of Adam de Brome, his almoner, for a provost and 10 fellows, and first named the College of Saint Mary, derived its present title from La Oriole, the name of a house presented by Edward III, into which it moved two years later. The buildings of Oriel College are among the finest in Oxford. The college now consists of a provost, 12 fellows and two professorial fellows and has 12 scholarships, tenable for five years and four exhibitions tenable till the end of the 20th term from matriculation. The value of each of these scholarships and exhibitions (during residence) is £80 per annum. Candidates for the exhibitions must be deserving persons in need of support at the university. No one is eligible to a scholarship who has attained the age of 20 years or who, being a member of the university, has passed two years since matriculation. The college has presentations to 15 livings. Among its distinguished alumni are Matthew Arnold, Barclay, Butler, Clough, Hampden, Thomas Hughes, Langland, Prynne, Sir Walter Raleigh, Cecil Rhodes, Wilberforce, etc., and several leaders of the Tractarian movement, Arnold, Keble, Newman, Pusey and Whately.

ORIEL WINDOW, a bay window of an upper story supported by brackets or corbels. In some cases the support is derived from a pier or engaged column carried from the ground with the upper part corbeled out to meet the

Oriel Window, Balliol College, Oxford.

floor of the projecting window. Formerly no distinction was made between this and a bay window which rose from the ground.

In France and England the oriel window is a feature of late Gothic and early Renaissance architecture, both in civic and domestic buildings. It is a favorite characteristic of German architecture where, placed at the angle of a building, it is sometimes carried up through

two or three floors and covered with a roof. It began to appear in the earlier Middle Ages and by the 15th century was in general use, chiefly above entrance gateways. Many fine reproductions of oriel windows appear in the modern American architecture of collegiate institutions and civic buildings. The word probably signifies "gilded porch" and originally was applied to the altar recess of a small oratory or chapel.

ORIENTAL REGION, one of the primary divisions of the earth considered with reference to its fauna; a zoogeographical province. It embraces the whole of southeastern Asia south of the Himalayan watershed, from Beluchistan to the Philippines and including all the Malayan archipelago as far as Celebes. It is separated from the Australian region by "Wallace's Line." See ZOOGEOGRAPHY.

ORIENTAL RESEARCH, the investigation and interpretation of ancient remains in the Near East.

Egypt.—Modern Oriental research commences with the expedition of Napoleon Bonaparte to Egypt in the summer of 1789. This expedition was accompanied by scientists and artists, who published the results of their observations in a great work entitled 'Description de l'Egypte' (1809-13). The antiquities collected by that expedition became the property of the conquering British and formed the foundation of the Egyptian collections in the British Museum. Among these was the famous Rosetta Stone. This monument, which became the key to the interpretation of all Egyptian literature and civilization, was a slab of black granite containing a portion of a decree in honor of Ptolemy V. Epiphanes, 205-181 B.C., written in ancient Egyptian hieroglyphics, the more modern Egyptian demotic script and Greek. By means of this trilingual inscription the Egyptian script was deciphered somewhat by Young in England and completely by Champollion in France, in the years 1821-32 or at least a comprehension of that script was established by their efforts, although scientific accuracy was not attained until more than 60 years later, principally through the labors of Brugsch, Erman and Maspero. The decipherment of the Rosetta Stone led to a desire to obtain more inscriptions, and in 1828-29, a Franco-Italian expedition was sent out, headed by Champollion and Rosellini, to examine the most important ruins of Egypt and copy pictures and inscriptions, the results of which were published both by Paris and Turin. In 1842-45 the Prussian government sent out a similar expedition under Lepsius, which explored the whole region of the monuments from the Sudan to Sinai and the Syrian coast, bringing back casts, drawings, maps, plans and (a new invention) squeezes of inscriptions, together with a considerable amount of antiquities and papyri. This expedition, the results of which were published in 12 great volumes in 1859, placed the study of Egyptian art and civilization on a permanent and scientific basis.

The period of excavation commenced in 1850, with the mission of a French scholar, August Mariette. The first and greatest of his discoveries was the Serapeum or tombs of the sacred Apis bulls at Memphis, 64 in all, the erection of which extended through the period

from 1300 to 50 B.C. In 1858 the khedive appointed Mariette conservator of Egyptian monuments, with authority to conduct excavations where he would in Egyptian territory, and established at Cairo the Bulak Museum. From this time until his death in 1881 Mariette exercised the exclusive privilege of excavation in Egypt. His explorations were enormous in extent, including all the well-known ruins, and more of the great discoveries of Egyptology were made by him than by any other man. No systematic report of his excavations, as such, has ever been published. He was concerned principally in the discovery and recovery of antiquities, a method of excavation which inevitably results in the destruction of a great amount of material archaeologically valuable, and his publications concern themselves with the antiquities discovered, not with the method of their discovery.

Mariette was succeeded by his pupil, Gaston Maspero (1881-86, 1899-1916), who instituted a careful system of protection and preservation of antiquities and ruins and constructed a large new museum (1902) to contain the magnificent collection of portable objects which resulted from the numerous excavations now conducted, notably at Deir el Bahri and Karnay. Revising the policy of his predecessor Maspero not only himself conducted excavations systematically at numerous sites on behalf of the Egyptian Museum, but also extended the privilege of excavation on liberal terms, but under careful scientific supervision, to foreign museums, societies and individuals. Taking advantage of this change of policy the Egypt Exploration Fund was organized in 1881, supported by money collected in almost equal parts in England and America, with the direction in the hands of the English contributors, and from that time to this the fund has continued a series of excavations, dividing its share of the finds between English and American museums and institutions. This organization was supplemented later (1896) by Petrie's Research Account, also Anglo-American, out of which developed the British School of Archaeology in Egypt (1905). The French established on a lavish scale the Mission Archéologique Française au Caire (1881), reorganized later (1901) as the Institut Français d'Archéologie Orientale au Caire. The Germans officially established the German Institute of Archaeology and attached its chief archaeologist to the German general consulate at Cairo. Later, in 1899, the *Orient Gesellschaft* was formed, somewhat on the principle of the Egypt Exploration Fund, except that its field was the Near East in general and not Egypt only. Excavations have been conducted not only by these agencies, but further by various museums and institutions, such as the Liverpool and British museums in England, the Metropolitan, Boston and Pennsylvania museums and Harvard and California universities in this country and by numerous authorities and private individuals here and in England, France, Germany, Italy and Austria continuously from 1883 or thereabouts until the present day, the Americans even continuing their work throughout the World War.

The objects found in these excavations are almost incredibly numerous. Besides the magnificent collections in the museum at Cairo, there are to-day important collections of Egyptian antiqui-

ties in the British Museum, the Louvre, Berlin, Turin (here is the famous Papyrus Prisse), New York, Philadelphia and Boston, with smaller but important collections elsewhere too numerous to mention. Besides the monuments and papyri belonging to those periods which we commonly call Egyptian, written in Egyptian characters, there have been found, mainly in the Fayum, vast quantities of papyrus fragments, containing parts of Greek manuscripts. Among these have been discovered several lost works, such as Aristotle's 'Constitution of Athens,' plays of Menander, poems of Sappho, Pindar, Bacchylides and others less famous. Some of the classical fragments contain important new readings in Homer, Herodotus, Xenophon, Sophocles, etc. Other fragments, sayings of Jesus and various heretical gospels, apocalypses and the like possess theological value. Immense quantities of letters, deeds and documents of various descriptions, written on fragments of papyrus or on potsherds, have revealed with photographic minuteness the every-day life of the people of the Fayum district in the centuries immediately preceding and succeeding our era and in doing so have thrown a perfect flood of light on Græco-Roman government and civilization in the Eastern Mediterranean in that most important period which saw the origins of Christianity. These discoveries may be said to have revealed the so-called *koine* or common, popular Greek of the Hellenistic period, and profoundly modified if not revolutionized the linguistic study of the Septuagint and the New Testament. Apparently, moreover, we are still only at the beginning of these discoveries, for millions of papyri still remain unstudied in the hands of museums and private collectors and more are constantly being discovered.

Explorations and excavations in Egypt have also thrown welcome sidelights on certain points of world history. Discoveries of Ægean pottery have enabled scholars to date with considerable accuracy the Minoan civilization of Crete. The discovery of cuneiform tablets at Tel el Amarna in 1888 threw much light on the conditions in hither Asia and especially in Palestine in the pre-Israelite period of the 14th century B.C., and the discovery of the records and documents of a Jewish colony at Elephantine (Jeb) in upper Egypt has both modified somewhat formerly existing views regarding the religion and the history of the Jews at and immediately after the Exile and also furnished scholars with most valuable material for the study of the western Aramaic dialect, in which about one-half of the biblical books of Daniel and Ezra are written. Following Egyptian civilization, Egyptian exploration, particularly in latter years, has extended itself southward to Nubia and the Egyptian Sudan, the ancient Ethiopia, increasing greatly our knowledge of the past history, political, religious and ethnological of that region and its interrelations with Egypt and the civilized world, and incidentally furnishing scholars with a mass of inscriptions (the so-called Meroitic, from Meroe, excavated by Budge in 1902 and Garstang and others since 1910) in a script and language as yet undeciphered. Sinai, also, has been included in the field of Egyptian research, and more particularly the explorations of Flinders Petrie have collected considerable

material and given us valuable information touching Egyptian history and Egyptian mining and metallurgy in that region from the time of the Old Empire onward and also have thrown some light on the inter-relations of Egypt and Asia. Of late, furthermore, attention has been paid by explorers to the collection and study of the Christian (Coptic) and Moslem remains with which Egypt abounds, but which earlier explorers and scholars had overlooked or disregarded.

The object of modern explorers and excavations, however, has not been, like those of Mariette, merely or primarily the collection of objects. Beginning with Petrie's excavation of Tanis in 1883 archaeology has been pursued as a science, excavation has been directed toward the collection and interpretation of all the information to be obtained bearing on the history and nature of the site explored, the location of each object found, in relation to all its surroundings, the careful observation of strata marking eras and periods and an exact plotting, mapping and photographing of the work stratum by stratum. The most distinguished and successful of these scientific explorers, to mention very few out of many, have been Flinders Petrie, Naville, Griffith, deMorgan (for a time director of antiquities), Reisner, Borchardt, Davis, Garstang and Grenfell and Hunt, to whom is due particularly the discovery and decipherment of the vast papyrus hoards. Scientific exploration has also resulted in the preservation *in situ* and the careful protection of ancient remains, temples, tombs, palaces and in some places whole towns, so that there is no part of the world where the traveler can so readily visualize the past as in Egypt. Even where great modern improvements have required a destruction of antiquities, like the flooding of a section of the country by the huge Nile barrage at Assuan, the region affected has first been carefully explored, everything which could be removed excavated and removed and what must be lost studied and exactly plotted and pictured.

In no other country have such extensive excavations been conducted as in Egypt, and in no other country have so large remains of antiquity been discovered, extending over so long a period. Egypt has preserved for us the most continuous record of the existence of man on the earth and his development, and Egyptian research has furnished the most complete and typical cross section of the history of the human race. Remains of palæolithic man have been discovered in deep borings in the Nile Valley, giving evidence of the occupancy of the country in pre-historic, geological periods, a hundred or a few hundred thousand years B.C. Later strata show the development from palæolithic to neolithic occupancy. What we may call civilized occupancy begins perhaps about 7000 B.C. At that time Egypt was peopled by a race somewhat different in type from the classical Egyptian, burying its dead with the body doubled up and the head and hands not infrequently severed from the body. They knew how to make bricks and they built towns, in part at least of brick. They wove linen and dressed leather for clothing; they made pottery of a great variety of forms and of extremely artistic shapes by hand, not being acquainted with the use of the potter's wheel, and by hand

also they cut stone vases of perfect form out of the hardest rock. They knew, furthermore, how to make a glaze both for this pottery and for their rock carvings. In the latter times they were acquainted with the use of copper, but their tools and weapons were still commonly made of flint, and their flint knives and lance-heads were finished more admirably than those found anywhere else in the world.

These people gave way at a still very early date to another people with a higher civilization, which we call the Egyptian, a composite race connected with the Semites of the East, the Libyans to the West, and the Cushites, comprising such tribes of modern times as the Galla and the Somali, to the south and southwest. Gradually the small states of upper Egypt were united in one kingdom and those of lower Egypt in another kingdom. The earliest exact day of which we possess a record comes from the northern kingdom, the kingdom of the Delta. In 4241 B.C. a solar calendar of 365 days was adopted; the same, with slight modifications, which has been handed down from that time to our present. Late Egyptian tradition tells of a dynasty of gods in lower Egypt and a dynasty of demigods in upper Egypt before we come to the first of the 31 dynasties of men, that is to sober, human history. But until very recently the beginnings even of the dynastic period were commonly regarded as mythical. Recent excavations at and about Abydos, however, have revealed a number of tombs of the very first dynasty, including that of the founder, Menes, himself, and we now commence recorded Egyptian history proper, in accordance with ancient tradition, with the first dynasty, about 3400 B.C. At that time Egypt was already united in one great empire, including both the southern and the northern kingdoms, but evidently a long political history lay behind this union. The Egyptian religion, as we know it from the records and monuments of that time, also evinces a long period of development; and while the early hieroglyphic writings of which we have now obtained abundant remains are rude and very different from the hieroglyphics of later times, they likewise show a long period of previous development. Progress, very slow up to this period, now becomes amazingly rapid. With the third Egyptian dynasty, a little before 3000 B.C., having its headquarters at Memphis, we come to the true copper age. Men had found proper instruments with which to cut stone; and the first buildings of hewn stone appear at this time. A century and a half later, about 2900 B.C., we are in the midst of the pyramid age, 3000-2500 B.C. So rapidly had architecture and the arts of sculpture and painting connected with it developed, that, while the first stone building was built not much before 3000 B.C., the period of the 5th dynasty (ca. 2750-2625) marks the zenith of Egyptian art, no structures of a later date equaling those of this period, while its sculptures and wall paintings are unsurpassed by those of any later time. In general the Egyptian of this early period had already reached that condition of luxury, effeminacy and exclusivism which seems to us such a characteristic feature of Egyptian civilization, and which, in striking contrast with the civilizations of Babylonia, Greece and Rome, prevented Egyptian civilization, in spite of the high

standard it attained within itself, from exerting any proportionally important influence on the development of the civilization of the world. The object of the Egyptians was to shut themselves out from the barbarism, uncleanness and dangers of the outer world, which outer world threatened them particularly from the side of Asia, from which side, as we have already seen, there had been already before this time irruptions. They built a wall to protect themselves from invasion by the Semites on the northeast, and beyond this wall they concerned themselves only with the Sinaitic peninsula, which they controlled for the purpose of mining copper, turquoise and malachite. There was of necessity, it is true, some sort of intercourse for purposes of commerce with the peoples of Asia, and objects found in the tombs of the early empire show contact with still more distant regions, but such commerce was conducted by middlemen, foreigners, who visited Egypt, not by Egyptians who visited foreign lands. Only toward the end of the 6th dynasty (ca. 2625-2475 B.C.) was a somewhat more aggressive disposition shown. Egypt was spreading southward, and military expeditions were also conducted beyond Sinai; but these seem to have been due to an unrest then prevailing in the Asiatic world, and resulting aggression from that side. The results of that aggression seem to have been some sort of catastrophe, for immediately following the 6th dynasty ensues a long period of comparative darkness, due apparently to invasion from without and the temporary eclipse of the Egyptian state.

With the 11th dynasty comes a period of restoration of prosperity and power in Egypt, reaching its climax in the 12th dynasty, and extending altogether over a period of almost 400 years, concluding in the first part of the 18th century before Christ, the period of the middle kingdom. This was considered by the Egyptians of a later period, not without justice, as the greatest of all the periods of Egyptian history. It was not a time of conquest. Possibly the old frontier was extended somewhat to the south, chiefly for the sake of the gold mines in Nubia. The copper and malachite mines of the peninsula of Sinai were also reclaimed, but further than this no conquests were undertaken in Asia. It was rather a period of internal development; a period in many ways like the mediæval period in Europe, the period of feudal development. Above all it was a period of literature, the golden age, to which all succeeding ages looked back. Poetry and romance flourished, and much of the literature contained in the papyri of later times consists of copies from compositions of this period. Egypt now also had somewhat more communication with the outside world than under the early kingdom. We find records of travel and notices of commercial and political couriers, who travel with "bricks in their bosoms" into barbarous and unclean lands.

In the early part of the 18th century came another catastrophe; the Hyksos invasion and conquest. A movement of the nations far away to the north and northeast brought into Asia Minor and Mesopotamia peoples from Europe, Sythia or central Asia, who possessed horses. The effects of the displacements thus caused were pressure on the Egyptian front, which

gave way, and in part that collapse was due to the possession and use in war of the horse, which had been introduced, and passed on to the Hyksos by the northern invaders.

From about 1788 to 1580 B.C., during the time while the land was in possession of these foreign and barbarous peoples, Egyptian history is an almost complete blank. With the 18th and 19th dynasties, approximately 1580-1205 B.C., the country entered upon a new period of prosperity, during which its relation to the outside world was very different from that of the past. The struggle with the Hyksos and their final expulsion made Egypt for the time being a warrior nation. Her Pharaohs not only drove out the Hyksos, but followed them into Asia, conquered all Syria up to the Taurus Mountains, and even conducted campaigns across the Euphrates into the land of the Mitanni in Mesopotamia. This resulted necessarily in close intercourse with the kingdoms and principalities of Asia Minor, Assyria and Babylonia, and the correspondence of the monarchs of this period with foreign potentates and with the subject rulers in Syria, the records of expeditions, treaties and the like possess a new kind of interest, in that they present a view of world history. We meet the peoples of Cyprus and Crete, the Hittites of Asia Minor, the Mitanni of Mesopotamia, the Babylonians and Assyrians, and numerous kings of petty states throughout Palestine and Syria. We read of elephant hunts near Aleppo, and obtain glimpses of forests where none now exist. It was a nervous, restless era, and the period of an apparently brilliant but really flashy and pretentious development. It was a time of tension, one great struggle, in which Egypt, at first successful, extending her sway as far as the mountains of Asia Minor and the Euphrates, finally found herself battling for life against new forces pressing on her from the north and east. Her first great opponents were the Hittites, but with and following these came hordes of people driven out of their homes in Asia Minor, the Ægean Islands and further westward by pressure from behind, descending by land and sea on Syria and Palestine, and almost forcing entrance into Egypt herself, while at the same time other hordes pressed in from the east, until all her Asiatic possessions were overrun and wrested from her. As it was a period of political unrest, so it was a period of religious unrest, and that religious unrest helped to precipitate the political catastrophe, namely, the reformation of Amenhotep IV, or Akhenaten, who built his new capital at Amarna, and the counter reformation which restored the supremacy of Thebes and its priesthood, and established hierocracy in Egypt.

From the beginning of the 11th century onward Egyptian history, so far as political power and mental and moral development are concerned, is in general a history of decadence and retrogression. Such revivals of power and activity as occur henceforth are due to conquests from without and the establishment of foreign dynasties. Libyans and Ethiopians struggle for the mastery, and occasionally Pharaohs of these foreign dynasties intervene in Asiatic politics. Then comes the period of Asia's conquest of Egypt. The Ethiopians are driven southward to Meroe, and first the Assyrians, and then, after a brief intermission

under Libyan dynasts, the Persians conquer and annex Egypt to the great Asiatic empires of the East. Next follows the Empire of Alexander, and the brilliant Græco-Egyptian period of the Ptolemies; then Roman rule, with its abundant prosperity and high culture. But Egypt is no longer Egyptian; her rulers, her literature, her culture are alike foreign. Then comes the Arabic conquest, when even the remnants of the ancient language disappear; and so it is as a Moslem Arab province that Egypt passes under Turkish rule, and ultimately under the English protectorate. All these periods have been enlightened by Egyptian research.

Assyria and Babylonia.—Assyrio-Babylonian research may be said to begin with the tentative excavations of Rich at Babylon in 1811. Others before that date had identified the ruin mounds of Babylon and Nineveh, and copies of Babylonian and Persian cuneiform inscriptions had already made their way to Europe, but Rich made the first serious survey of the mounds of Babylon. In 1820 he made a similar exploration in the ruin mounds of Nineveh and Calah. The inscriptions secured by him at these sites formed a nucleus for the later great Assyrian and Babylonian collections in the British Museum.

More than 20 years elapsed after Rich's death before any systematic excavations were undertaken. Then through the influence partly of Julius Mohl, one of the secretaries of the Société Asiatique, who had seen in London the inscribed material gathered by Rich in Assyria and Babylonia, the French government was induced to create, for purposes of investigation, a vice-consulate at Mosul, nearly opposite Nineveh, and Paul Emil Botta was sent out to fill this position. After some rather unsuccessful excavations at Kuyunjik, on the site of ancient Nineveh, Botta was led by the reports of the natives to undertake excavations at Khorsabad, 20 miles to the northeast. Excavations were conducted at this site by Botta from March of 1843 to October of 1844, and by his successor, Victor Place, from 1851 to 1855, at the expense of the French government, which also published the results in monumental form. These results were the systematic and scientific excavation of a palace of Sargon, king of Assyria, 721-705 B.C., which was adorned with a large number of magnificent bas-reliefs and other works of art. The French expedition also discovered a considerable number of inscriptions in the cuneiform script on stone and clay.

Shortly after Botta commenced his work of excavation, Austen Henry Layard visited Mosul on his return from Persia to Constantinople. His enthusiastic report secured for him a small sum of money from Lord Stratford de Redcliffe, the British Ambassador, with which he returned to Mosul in the autumn of 1845 and commenced excavations on a very small scale at the mounds of Nimroud, on the banks of the Tigris, a few miles below Mosul, the remains of the one time Assyrian capital city of Calah. With very limited resources, but with remarkable success in the discovery of sculptures, bas-reliefs, inscriptions and the like, Layard continued to excavate at Nimroud, Kalah Shergat, the most ancient capital of Assyria, still further to the southward, and at Kuyunjik (Nineveh), until midsummer 1847. In 1849 he was again sent out to Assyria and for almost three years

conducted excavations for the British Museum at the sites already mentioned, making one brief and unsatisfactory expedition to Babylonia. The wonderful success which Layard achieved in monumental results, and possibly still more the remarkable ability with which he presented these results in graphic form, connecting them also with the Bible story, aroused an interest which has continued to the present day, and which will forever make the name of Layard illustrious in connection with Assyrian exploration.

In 1851, while Place was excavating at Khorsabad, an admirably equipped expedition, sent out by the French government under the direction of M. Fulgence Fresnel, was exploring Babylonia and conducting tentative excavations at various sites in that region. The material results of this expedition were, unfortunately, lost by the overturning of a raft on the River Tigris. At the same time the attention of the English was called to Babylonia by the work of Loftus, who, sent out as an attaché of the Turco-Persian Frontier Commission, took occasion to explore Babylonia and conduct some small excavations at Warka (Erech). The Assyrian Excavation Fund was organized in 1852, and, under the general direction of Sir Henry Rawlinson, excavations were carried on by Loftus, Taylor and Rawlinson himself at various sites in Babylonia, including Erech, Ur, Eridu, Larsa and Borsippa, the sister city of Babylon, and by Hormuzd Rassam at Nineveh. None of these explorers undertook the scientific excavation of sites, but rather sought to recover inscribed material, which, in the form of clay tablets and cylinders, they found in large quantities, especially Rassam, who, without knowing it, excavated a large part of the library of the Assyrian king, Ashurbanipal (668-626).

From 1855 to 1872 there was a long period of inactivity, so far as excavations were concerned, the attention of scholars being directed to the study of the numerous inscriptions which had been brought back to England and France, the key to the decipherment of which had just been discovered. As in the case of the Egyptian inscriptions, so here, it was a trilingual inscription which furnished the clue to the decipherment. As early as the commencement of the 19th century various scholars had essayed to read the cuneiform inscriptions brought back from Persepolis and elsewhere, and different scholars succeeded at various times in deciphering a few characters, but not in reading an inscription. On the face of a cliff, in a huge space especially prepared for the purpose, its lowest part some 300 feet above the ground, in the mountain pass at Behistun in Persia, Darius, so tradition said, had caused a long inscription to be engraved. Of this inscription Sir Henry Rawlinson on various occasions, between the years 1835 and 1839, at considerable expense and much risk of life and limb, succeeded in obtaining complete copies. It was clearly written in three languages, but what the languages were was unknown. Rawlinson assumed that the first was Persian, similar to the language of the *Avesta*. It was not until 1846 that he was able to complete and publish the decipherment of the Persian cuneiform text. The Persian cuneiform proved to be syllabic, an adaptation, vastly simplified,

from the complex Semitic Babylonian of the third inscription. This, the most important text for students of Assyriology, Rawlinson did not succeed in deciphering for five more weary years (1851). The second inscription, the neo-Susian text, was not satisfactorily deciphered until 1890. The decipherment of these inscriptions was naturally an epoch-making event, and for this as well as for the great service which he rendered in publication (he was the general editor of the Cuneiform Inscriptions of Western Asia, published by the British Museum), Rawlinson's name stands deservedly at the head of the honor list of Assyriology.

In 1872 George Smith, then an employee in the British Museum, discovered among the fragments of clay tablets brought by Rassam from Nineveh, an Assyrio-Babylonian flood legend, strikingly similar in many respects to the flood story of the Hebrew scriptures. The publication of this story aroused such interest that the *Daily Telegraph* of London at once put at the disposal of the British Museum a thousand guineas to send Smith to Kuyunjik to search for more fragments. This expedition opened a new era of excavation. In the following year Smith was again sent to Kuyunjik by the British Museum. In 1875 he was sent out for the third time, but died, without accomplishing anything, in 1876. Rassam then consented to take up once more the work of excavation for the British Museum. Besides excavating at Nineveh and Calah, he explored in this campaign (1877-82) the hitherto unknown Assyrian site of Balawat, where he found great bronze doors with inscriptions and reliefs of Shalmaneser II, 859-826 B.C. He also conducted excavations at a number of Babylonian sites, Borsippa, Cutha, Sippara and others, from which he secured an almost incredible number of inscribed clay tablets. His work was conducted, like that of the English explorers in general, for the purpose of obtaining inscriptions, with no attempt at a complete and scientific excavation of the sites explored.

At the same time that Rassam resumed his work of excavation, DeSarzec was appointed French consul at Basra, in southern Babylonia. Led by reports of the natives, he commenced excavations at some ruin mounds in that region, known as Tello, where he found a quantity of statues dating from the third millennium B.C., executed with remarkable skill in hard diorite and covered for the most part by inscriptions in cuneiform characters, the first monuments of art discovered on the soil of Babylonia. These monuments were purchased at once by the French government for the Louvre Museum, and DeSarzec commenced a systematic exploration of Tello, the ancient Lagash, which he conducted at intervals until the time of his death in 1903, when he was succeeded by Captain Gros. The result of these excavations has been the discovery of an enormous quantity of inscribed clay tablets belonging to a most remote period, as well as statues, inscribed bronze and silver figures, vases and other objects, showing a remarkable development of art in that region at an extremely early period. These results have been magnificently published in monumental form.

American interest in Babylonian exploration dates from the year 1884, when an expedition headed by Dr. William Hayes Ward, called

the Wolfe Expedition, from the fact that the funds were provided by the liberality of Miss Catherine Lorillard Wolfe, of New York, was sent out, under the auspices of the Archaeological Institute of America, to examine ruin sites in ancient Babylonia and report on the prospects, scientific and practical, of excavations in that region. In 1887 a somewhat similar German expedition was sent out, which conducted tentative excavations in two burial mounds, Hibba and Surghul, in southern Babylonia. Both of these expeditions reported favorably on Nuffar, the site of the ancient Nippur, as a place for excavation. In 1888 the Babylonian Exploration Fund was organized in Philadelphia and an expedition was sent out under the auspices of the University of Pennsylvania, with the present writer as director. The site selected for excavation was Nippur, where systematic explorations were conducted under Peters, Haynes and Hilprecht intermittently until 1900. The main work of the excavation at Nippur was directed toward the great Temple of Bel, the chief religious centre of that region from a period long antedating 4000 B.C. Some 40,000 or more inscriptions, clay tablets and fragments of clay tablets, stone monuments and the like were recovered, and our knowledge of the history and civilization of Babylonia was carried back 2,000 years or more. The texts of these tablets are being published by the University of Pennsylvania in a noble series of volumes, but the real work of interpretation has scarcely yet begun.

The success of the Americans in securing remains of such great antiquity aroused fresh interest everywhere. The English resumed for a brief time their abandoned work at Nineveh, and they, and even the Turks, conducted some unimportant excavations in Babylonia. The French excavations at Tello, then lying dormant, were resumed, and finally, in 1897, a new expedition of investigation was sent out by the Germans. In 1899 the German "Orient Gesellschaft" was organized, and excavations commenced at Babylon under the direction of Dr. Koldewey, a member of the former German expedition to Hibba and Surghul, which excavations continued until the war. The French excavations at Khorsabad were scientific; the English excavations in Assyria and Babylonia and the French excavations at Tello were very successful antiquity hunts. The American excavations at Nippur were semi-scientific, but lacked equipment and training to make them entirely so. The German excavations at Babylon were thoroughly scientific, and although the explorers found no such relics of great antiquity as the French and Americans (for, owing to the thoroughness of Sennacherib's destruction, the Babylon unearthed by the Germans is relatively modern, practically the work of Nebuchadnezzar), nor such great masses of inscribed objects as were found by the English. French and Americans, they have given us a knowledge of the construction of Babylonian temples, palaces, streets and dwellings such as none of the others have given. Further the Germans introduced the plan of publishing systematically, at short intervals, reports of progress, *Mittheilungen*, in addition to the fuller scientific publications issued at the close of the whole work. As a result scholars have been able to follow and in a way co-operate in

their work. In 1903, under Dr. Andrae, they commenced a similar excavation of Kalah Shergat, on the Tigris, the ancient Ashur, the original capital and home of the Assyrians, which was continued until 1914 with results which have considerably changed our ideas of early Assyrian history. The earliest temple of Ishtar at this site dates from the close of the third millennium, but below this were still archaic Sumerian remains. The early city was destroyed by fire by conquerors supposed to belong to the Mitanni-Hittite movements, and then out of the composite of these peoples with Semites and Sumerians grew the new Semitic state and religion of Assyria. Like the excavations of Babylon the excavations at Ashur have thrown much new light on town and temple building, on sepulture and the like. The Germans also conducted some slight excavations at Fara (Shurippak) in southern Babylonia, and just as the war broke out they were commencing the great undertaking of a thorough and scientific exploration of the mounds of Warka, the ancient Erech. Unfortunately, while extremely scientific, the German exploration of Babylonia and Assyria has been also political, a part of their elaborate system of controlling the country, and hence since 1900 they have thrown obstacles in the way of all other explorations but their own.

The interest aroused in America by the success of the work at Nippur led to the organization in 1900 of the Ur Expedition, through the energy and enthusiasm of Dr. E. J. Banks, and permission was applied for to excavate Mugheir, the traditional Ur of the Chaldees. For three years this permission was held up by the Turkish government, under the influences just indicated, although during that period similar permission to excavate at various Babylonian sites was freely granted to the Germans. At last in 1903 the Ur Expedition was disbanded. Just at that moment the despatch of American ships to Beirut led to the unexpected issuance of the firman which had been so long delayed. Simultaneously a new organization was formed, called the "Oriental Exploration Fund of the University of Chicago," which accepted the firman issued on behalf of the Ur Expedition, and in the winter of 1903-04 excavations were conducted by this organization, under the direction of Dr. Edgar J. Banks, at Bismaya, the site of the ancient Adab, not far from Nippur, an important city, hitherto quite unknown; presumably in this like many more of the almost countless sites which dot the great Babylonian plain.

Besides these legitimate excavations there has been also a vast amount of destructive digging in Babylonia. From an early period old cities were used as quarries from which to obtain the material for new ones. So Seleucia, Ctesiphon and Bagdad were built largely out of bricks from Babylon. To this industrial exploitation of ancient remains has been added in the last half century the illicit excavations of natives in search of inscriptions to be sold to foreign museums and collectors. Hundreds of thousands of inscribed clay tablets have been excavated in this manner, and probably as many more destroyed, in addition to the incalculable loss of other objects. Many sites have been absolutely riddled, so that no future scientific excavation can make them tell their story. The

feeble efforts of the Turkish antiquities service have been quite unable to check this destruction, and unfortunately foreign museums, and especially the British, instead of combining to stop these illicit excavations, have encouraged them, because they furnished objects for their collections. Fortunately the number of ruin mounds in Babylonia is almost countless. There everything was built of clay, and even monuments of stone are few. Only in Assyria the palaces and temples were frequently faced with stone, stone monuments were freely used, and the rooms of temples and palaces were often wainscoted with slabs of stone carved in bas-relief. Only the British Museum and the Louvre possess fine collections of these stone monuments; but collections of clay tablets from Assyria and Babylonia numbering hundreds of thousands are scattered among many museums, notably London, Paris, Berlin, Constantinople and Philadelphia, and private collections too numerous to mention.

Persia.—Research in Persia is closely connected with research in Babylonia, and it was indeed through the decipherment of the cuneiform inscriptions found at Behistun in Persia, on the road from Bagdad to Hamadan, that the key to the decipherment of the Babylonian inscriptions was discovered. Rich visited and described Persepolis as well as Babylon and Nineveh, and other early explorers copied inscriptions there and elsewhere in Persia; but no excavations were conducted until 1851. These first excavations at the site of Susa, conducted by the English explorer, Loftus, and Colonel Williams, head of the Turco-Persian Frontier Commission, were, however, of very small extent. Thirty years later M. and Mme. Dieulafoy conducted excavations of a more extensive character at the same place, enriching the Louvre Museum in Paris with very many beautiful colored tiles, and published an account of their discoveries, a large work in many volumes, and a briefer and more popular work, *L'Acropole de Susa* (1890); but even these excavations were very superficial.

In 1895 the French government concluded a treaty with Persia, by which it received exclusive rights of excavation, and in 1897 M. J. deMorgan, at that time Director of Antiquities in Egypt, was appointed Director of Excavations in Persia. While no other part of Persia has been explored beneath the surface, since that date systematic and extensive excavations have been conducted at Susa by deMorgan and his associates for the French government, and the results have been published with remarkable promptitude and in admirable form for the student. The explorers have been notably successful in discovering a large amount of inscribed material, their most important discovery, and one of the most important in the annals of Oriental research, being a large *stele*, carried off by the Elamites from Babylonia, containing the code of laws of Hammurapi, king of Babylon about 2100 B.C., by more than a thousand years the earliest code of laws ever discovered anywhere, and one which profoundly influenced all the later legislation and civilization of western Asia, but which was manifestly a codification, enlargement and application, like Alfred's code in England, of laws and customs having already a long history of growth behind them. A not inconsiderable part of the treas-

ures found at Susa are Babylonian and Assyrian statues or inscriptions carried off by the Elamites in their raids or conquests. Lying along the valleys of the Karun and the Kerkha, which, descending from the Persian mountains, find their way to the Persian Gulf along with the Tigris and Euphrates, Elam is almost a part of Babylonia, and the excavations at Susa show that their civilization was practically identical. The relation between them for about 2,500 years was similar to that of England and Scotland, Elam representing Scotland. They warred with one another, and raided and conquered one another from the beginning of the third millennium onward. The earliest inscriptions from Susa are in the Babylonian script and language. Later we find inscriptions in the same script and the language of the Elamite mountaineers, the so-called Anzanite, out of which ultimately developed, apparently, the neo-Susian, the second language of the Behistun inscription, known only from that inscription, written in a simplified form of cuneiform with less than 90 signs, as over against the 500 more or less of the Babylonian. From this again seems to have developed the Persian script of 36 or 37 characters found in the Behistun inscription, and in a few short rock and vase inscriptions.

Assyriology.—Unlike the Egyptian the Babylonian civilization was from the outset international, and as a result the cuneiform script came to be widely used from a very early period. Invented by the Sumerians, it was adopted and applied to their tongue by the Semites in Babylonia. In Elam it was first used, as already pointed out, with the Sumerian language, but afterward was employed to write the native Anzanite language. Later, modified and simplified, it was used for the neo-Susian and the Persian. By the beginning of the second millennium the Semitic Assyrians were using the Babylonian cuneiform script in a somewhat simplified form, while a little earlier the Cappadocians of Asia Minor had already begun to use both the Babylonian script and language in clay tablets. At about 1400 B.C. Syrian and Palestinian princes were using the Babylonian cuneiform even in their correspondence with the Egyptian overlord; the Hittites and the Mitanni were using it both for Babylonian and their own languages, as revealed by clay tablets found in Egypt and Asia Minor; and a little later the people of Armenia were using it for inscriptions in their own tongue, the so-called proto-Armenian, on the rocks in the region of Lake Van. Up to the present time cuneiform inscriptions have been discovered in no less than eight languages covering a vast extent of territory and a period of 3,000 years and more, from the close of the fourth millennium to 50 B.C. The decipherment and interpretation of these inscriptions on clay, stone, glass, ivory and metal constitute what we know as Assyriology.

The interpretation of these inscriptions, with the other discoveries made by excavations in Babylonia, Persia and Assyria, enables us to trace the course of Babylonian civilization from about 7000 B.C. At that period the inhabitants of Babylonia were already organized into communities, building fortified towns, the central point of importance in which was the temple of their god. They made pottery; they manu-

factured bricks, although using in their structures for the most part unburned bricks. One people seems to follow another, or perhaps rather the strata show differences of development. The bricks made at the beginning are never excelled. Pottery of a high grade appears in certain early strata, only to disappear again, giving way to inferior goods. As early, apparently, as 5000 B.C. the principle of the arch was discovered. A system of drainage had been developed. Huge canals were dug to direct and control the inundations of the Tigris and Euphrates. City communities were sufficiently large and well organized, socially and politically, to undertake constructions of great size, involving the work of large numbers of men extending over a long period. In the latter half of the fourth millennium we begin to meet with written records and enter upon what we may call the historical period. The Sumerians, who invented the complicated cuneiform script, evidently brought it from some mountainous region, perhaps from the Persian mountains through the Elamite plain; and at the period when we first meet that script it evidently had a long period of development behind. The people using it, the Sumerians, were already in the copper stage of civilization. They occupied principally the south of Babylonia. In the north were chiefly Semitic peoples, who very shortly adopted and adapted the Sumerian script, and Babylonian civilization resulted from the amalgamation of the Sumerians of the south and the Semites of the north. In the first half of the third millennium, about the period of the great pyramid builders of Egypt, we find in southern Babylonia a remarkable sculptural development, having its centre at the town of Lagash. From about this period also date the earliest long religious texts, synchronous with the pyramid texts of Egypt. It must be said, however, that while we find such synchronisms there is no apparent connection of Babylonian and Egyptian civilization in these earlier periods. Each goes on its own independent way. These earliest religious texts show us that in the first half of the fourth millennium Babylonian civilization stretched up the Euphrates almost, if not quite, to the Mediterranean. The Semites of northern Babylonia constituted part of a larger whole. Aleppo is mentioned side by side with Kish in Akkad, or northern Babylonia, and Nippur in Sumeria, or southern Babylonia, as one of the three great cult cities. Throughout the whole of the third millennium B.C. various city states north and south strove with one another for the hegemony, while Elamites and Babylonians engaged in a continuous struggle. Toward its close, just when Egypt was going into a state of eclipse due apparently to Semitic invasions, the Semitic element finally prevailed over the Sumerian, the north over the south, and an actual empire was established embracing the whole of Babylonia. Babylon became the centre of culture, religion and literature, and Babylonian civilization became Semitic, the Sumerian language, however, continuing to be used until almost the commencement of the Christian era as a church language, as Latin was used in Europe through the Middle Ages.

By the close of the third millennium Babylonian civilization had crept northward up the

Tigris and founded a new centre at Ashur. Early in the second millennium there were great upheavals in the north and movements downward from Asia Minor of Indo-European peoples who sacked and burned both Babylon and Ashur. These movements, which resulted in Egypt in the Hyksos conquest, resulted eastward and northward in the establishment of the Kassite dynasty in Babylonia; of the kingdom of the Mitanni in Mesopotamia, westward of Assyria; and of the dominance of Hittites and Egyptians further westward still in that trans-Euphratean region which up to this period had been Babylonian, and where the influence of the Babylonian script, literature and religion still continued largely to prevail.

Politically Babylon loses influence from that time, although it continues, until its destruction by Sennacherib, in 689 B.C., to be the great religious and cultural centre of all Hither Asia, playing from Persia to the Mediterranean and from the Black Sea to the Persian Gulf a rôle comparable to that played by Rome in Europe during the Dark and Middle Ages. Politically Assyria forges gradually to the front, becoming first the dominant factor in the valleys of the Tigris and Euphrates, and then a great world power, full of the lust of conquest, destructive rather than constructive, overturning and exploiting kingdom after kingdom, and empire after empire, until in the 7th century it ruled the world, from Persia on the East to Egypt on the West, and from the mountains of Armenia northward to the Persian Gulf and Arabia southward. Its devastations open the way finally for a great invasion of wild Scythian hordes and Nineveh falls toward the close of that century, to be succeeded for a brief period by a new empire of Babylon, by the Lydian kingdom in Asia Minor, by the Median kingdom to the east and the Egyptian to the west. A little later these are merged in the mighty Persian empire, which sought to construct and unify, while it conquered, the whole of Hither Asia, the region included in our review. The history of our region from this time onward is not one of research and exploration, derived from cuneiform texts and monuments, but is known from the literary remains of Greece and Rome and Judæa. In Babylonia and Assyria, along the Euphrates, and in Mesopotamia there are abundant remains of the Seleucidian, the Sassanian, the Parthian and the brilliant Arabic periods, but so far research and exploration has concerned itself almost entirely with the more ancient material, leaving the remains of these later periods untouched.

Palestine.—While the keenest interest in Egyptian and Babylonian excavations was aroused by their relation to the Bible, exploration in Palestine, the Bible land proper, commenced at a much later date and has been prosecuted with less energy than the similar work in those regions. The first important work was done by an American, Rev. Dr. Edward Robinson of New York. In 1838 (and again in 1852), accompanied by Eli Smith, an American missionary in Beirut, he explored the Holy Land, identifying for the first time on rational grounds the greater part of the ancient sites of the country, a work of historical topography. The second move in exploration, a direct result of Robinson's work, was also made by America, the United States government sending out an ex-

pedition in 1847 under Lieutenant Lynch of the navy to explore the Jordan and the Dead Sea. The interest aroused by Robinson's publications affected England and the continent of Europe still more than America, and during the next two decades a number of travelers and explorers visited the country, including the Prince of Wales and Dean Stanley. Van de Velde of the Dutch navy prepared a map, as the result of his visits; William Smith compiled a dictionary of the Bible, and Sir G. Grove visited the Holy Land to study the places he was to describe in that work; Baroness Burdett-Coutts, anxious to furnish Jerusalem with a proper water supply, contributed £500 to make a plan of Jerusalem and its environs, and in 1864 Sir C. W. Wilson made the survey for this, including an accurate map of Jerusalem, with plans of the sacred sites.

Finally, in 1865, the Palestine Exploration Fund was organized for the purpose of undertaking a scientific and complete exploration of the country, and commenced its work by excavations at Jerusalem, under Sir Charles Warren (1867-70), which were valuable in determining the topography of the temple area, although almost nothing was found in the way of antiquities. At the same time (1868-79), partly connected with the Palestine Fund, partly independent of it, Sinai and the "Desert of the Exodus" were mapped and explored by Sir C. W. Wilson with a party of Royal Engineers, and by Professor Palmer of Cambridge. Then followed (1871-77) a careful survey of Western Palestine, under the direction of Conder and Kitchener, assisted by naturalists, archaeologists and linguists, so that the result was not merely a careful and accurate physical map of the country, but a study of all ruins of any sort visible on the surface, of the climate and the geology, of the fauna and flora, of place names, with a view to identifying ancient sites, and much more; all of which was published in the monumental memoirs of the fund, which has also, since 1869, published quarterly statements (to which have been added latterly annual volumes) giving a current view not only of their work, but of all matters of interest concerning Palestine.

An American Palestine Society, similar to the British Palestine Exploration Fund, had been formed simultaneously with the latter, to which had been assigned the country east of the Jordan, and an expedition was sent out to explore that country. Unfortunately this expedition accomplished little or nothing, and the American society shortly disbanded. In 1881 Conder was commissioned by the British Palestine Exploration Fund to do the work which they had undertaken, but the strained relations of the British and Turkish governments brought this survey to a speedy conclusion, after only 500 square miles had been surveyed. Later this work was done in part by a local engineer, Dr. Schumacher, of the German Temple Colony at Haifa, sometime an American citizen, but later a German, first for the British Palestine Exploration Fund, but after 1884 for the German Palestina Verein (organized in 1878). In 1883-84, also, Professor Hull, Director of the Geological Survey of Ireland, conducted for the fund a geological survey of the Arabah, the great depression con-

taining at its lowest point the Dead Sea. The geographical survey was finally completed by the survey in 1913-14 of the region known as the Negeb, extending from Beersheba southward to the Egyptian frontier. On the whole Palestine has been explored, mapped and surveyed as far as anything above ground is concerned, with great thoroughness (in Western Palestine especially every foot of the surface has been minutely covered), and the results made available in scientific publications and popular volumes, in maps and casts and pictures, to a very large public. In fact nothing comparable has been done for any ancient country.

It must be said that this exploration yielded very small results in ancient monuments and inscriptions of importance and indeed such of the latter as have been found were found by the natives or by accident. These are the Moabite Stone, containing an inscription of Mesha, a king of Moab in the 9th century B.C., found by a German missionary, Klein, at Dibon in 1868 and later largely destroyed by the Arabs, what remains being preserved in the Louvre; secondly, a Hebrew inscription, possibly of the time of King Hezekiah, found by boys bathing in the Siloam tunnel, beneath the hill of Ophel and dealing with the construction of that tunnel, now in the museum at Constantinople; and thirdly, a Greek barrier inscription from the temple of Herod, found by Clermont Ganneau in use as a tombstone in an old graveyard in Jerusalem, also at Constantinople. More important for the history of Palestine, however, than any of these inscriptions found in Palestine itself, was the discovery in 1888, already referred to, by the natives, at Tel el Amarna in Egypt, of about 300 clay tablets written in the Babylonian cuneiform script, from kings, petty princes and Egyptian representatives in Palestine, northern Syria, Mesopotamia and Babylonia to the Egyptian overlord, about 1400 B.C. The discovery of these inscriptions made it plain that at that date, antedating the Hebrew conquest, Palestine possessed a civilization largely identical with that of Babylonia and that writing on clay tablets was practised in that region.

This discovery led to the belief that excavations in Palestinian sites would result in the discovery there of similar inscriptions on clay and probably also of stone inscriptions like the Mesha monument and the Siloam inscription from the Hebrew period. On behalf of the Palestine Exploration Fund, which had conducted no excavations since the conclusion of Warren's work at Jerusalem in 1870, Petrie, the Egyptian explorer, made a reconnaissance in 1889 and conducted tentative excavations at the mound of Tel-el-Hesi, the ancient Lachish, in the extreme southwestern part of Judæa, on the borders of the Philistine plain. In the following year the Palestine Exploration Fund entered upon a systematic campaign of scientific excavation under the direction of Dr. F. J. Bliss of Beirut, an American. Excavations were conducted at Lachish (1890-93), at Jerusalem (1894-97), where the southern wall of the city was excavated and traced and from 1898 to 1900 at various sites in the Shephelah, the foothills between Judæa and Philistia, including Tel es-Safi, the ancient Gath, and Tel Sandahannah, the ancient Marissa, where a

Seleucid city was explored, but the excavations came to a close before the Hebrew city beneath could be examined. Later, the natives unearthed the necropolis of this city, and, in 1902, Dr. Thiersch of Munich and the present writer had the good fortune to discover in that necropolis elaborately decorated tombs containing Greek inscriptions belonging to a Sidonian colony settled at Marissa, then the Edomite capital, in the Seleucid period, the only discovery of this sort yet made on Palestinian soil. More complete and much more extensive than any of the foregoing was the excavation of Gezer by R. A. S. Macalister, formerly Dr. Bliss' lieutenant (1902-03 and 1907-09), the account of which is contained in three volumes of the monumental memoirs of the fund. This was followed in 1911-12 by Mackenzie's excavation of the neighboring Beth Shemesh.

Besides these excavations of the Palestine Exploration Fund, excavations have also been conducted during the present century by Dr. Sellin of Vienna, at Taanach, on the plain of Esdraelon, and at Jericho in the Jordan Valley. Just before the outbreak of the World War he had also commenced excavating in the neighborhood of Shechem. Dr. Schumacher for the German Palestine Society and the *Orient Gesellschaft* excavated Mutesellim, the ancient Megiddo, and a Harvard University expedition partially excavated Samaria, finding, apparently, the lower part of Ahab's palace. Immediately before the war excavations were conducted on the hill of Ophel, south of the temple at Jerusalem, under English and Jewish auspices. Under various auspices also there have been explorations of the synagogues of Galilee, the tumuli and stone remains of the East Jordan country, and the Nabataean-Edomite rock city of Petra. In 1900, through the efforts of the late Professor Thayer of Harvard, an American Oriental school, similar to the schools of archaeology at Rome and Athens, was established at Jerusalem, to give American students an opportunity for study and research in the Holy Land itself, and to secure continuous and systematic investigation. In 1903 a similar German institution was established and at about the same time the French Dominican monks established an *Ecole Biblique*. These three institutions have not only undertaken various minor explorations and excavations; they are also centres of observation to study and make known all that is found or done in Palestine.

Besides the scientific and legitimate excavations above described, there has also been in the latter years much structural excavation for new buildings at Jerusalem and an enormous amount of illicit digging by natives to obtain antiquities to sell to tourists and collectors. Especially immense numbers of graves and tombs have been opened and robbed, so that some ancient sites now resemble nothing more than rabbit warrens and the destruction of ancient remains as a result of this sort of antiquity-hunting has been, probably, in proportion to the amount of those remains, much greater than in any other ancient country.

On the whole the results of excavations in Palestine have been disappointing. Of the expected inscribed clay tablets there have been found in all only about half a dozen, Babylonian and Assyrian, of no great importance; of Hebrew inscriptions, a seal cylinder or two, and

a few potsherds and jar handles. In general, the more interesting and important discoveries have been pre-Israelite. At Gezer, where the excavations were most complete, there was unearthed a pre-Israelite open-air temple or place of worship, consisting of huge stones set up in alignment, connected with an ancient system of caves; also a remarkable shaft tunnel of the same period, cut through the solid rock to a source of living water beneath. From these excavations, with what has been obtained from Babylonian and Egyptian sources, especially the latter, we are able to restore somewhat the history of Palestine before the Philistine and Hebrew conquests. Before the middle of the third millennium the country was inhabited by a primitive and barbarous people, living largely in caves dug out of the soft rock and using stone implements. By the middle of the third millennium, the time of the great Semitic development in Egypt and Babylonia, these were replaced or overlaid by Semites, using copper, who built overhead cities and organized city states; but who adapted and developed certain of the practices of the earlier inhabitants, religious and otherwise, and who especially developed enormously, but for different purposes, their cave-cutting habits. As a part of Amurru, the West Land of the Babylonians, these soon came into contact with outside civilization, Ægean, Egyptian and Babylonian, adopting from the latter in the second millennium the cuneiform script and the Babylonian language for their apparently scanty official correspondence. Compared with the surrounding civilized regions they were very backward. Under Thutmosis and his successors in the 16th century Palestine became a part of the Egyptian empire, retaining, nevertheless, the Babylonian script and tongue for official use. With the development of the Hittite power in the 15th century Palestine became in part a battleground between Egypt and that power. About 1400 B.C. the Amarna tablets reveal a number of city states, nominally under Egyptian suzerainty, crumbling away before invasion from without. When this period of disintegration comes to an end we find the Philistines, apparently from Crete, in possession of the coast, and the Hebrews, in the main an Aramæan people, but using the kindred language of Canaan, struggling for the possession of the land as a whole. This is the commencement of the Biblical period, for which we have excellent literary sources in the Bible, supplemented somewhat by Assyrian-Babylonian and Egyptian monuments, but on which excavations in Palestine have shed little light. The Hebrew period is singularly barren of structural, architectural and inscriptional remains. The visible remains of the past, such as they are, with the exception of the rock cuttings—tombs, holy caves, cities of refuge and the like—which are extraordinarily abundant and belong to all periods, date generally from later periods, the Judeo-Roman of Herod, at Jerusalem and Samaria; the Hellenistic, beyond Jordan, to which belong the magnificent ruins at Amman and Gerash; or the time of the Crusades, which was an age of massive building that left its mark on the whole land.

Syria Outside of Palestine.—Excavations were conducted at various points on the Phœnician Coast in 1860 and 1861 by a French expe-

dition under the direction of Renan, without important results. In 1888 native stone-cutters at Sidon discovered the so-called Alexander sarcophagi, which, with the sarcophagus of a Sidonian king, Tabnith, were excavated by Hamdy Bey and carried to Constantinople. These Sidon sarcophagi rank among the art treasures of the world. In 1901-02 a Phœnician temple was excavated at Sidon for the Turkish government by Macridi Bey. Through the interest in Oriental archaeology aroused in the German emperor by his visit to the East, a German expedition was sent out in 1901 to explore and restore the ruins of the temples at Baalbek and in connection with this some excavations were conducted in the Hellenistic Gerash, beyond Jordan. At the same time the Sultan presented to the Kaiser the small but remarkable ruins at Mesheyta in Moab and in 1903, under the direction of Dr. Schumacher, these were removed bodily to Berlin to adorn the New Friedrich Museum.

The surface antiquities of Northern Syria southward to the Hauran were explored, inscriptions collected and the like a half a century and more ago by two French scholars, de Vogué and Waddington, and various scholars have visited and described the Palmyrene region. At the beginning of the 20th century a far more complete work of surface exploration was carried out by the American Archaeological Expedition to Syria, under the auspices of Princeton College and the direction of Howard Crosby Butler. In the 70's of the last century the British undertook some very superficial excavations at Carchemish (Jerabis), the capital of a Hittite kingdom on the Euphrates. In 1911 the British Museum resumed a more systematic excavation of this important site, under the general direction of Hogarth, which was stopped by the war. In 1886 and again in the following decade, the Germans conducted excavations at the small mound of Sinjerli, northward of Aleppo, which resulted in the discovery of a town and palace of rather rude construction, with Aramæan and Hittite inscriptions and sculptures of the 8th and 9th centuries B.C. With these exceptions no excavations have been conducted in Syria. We know from Babylonian inscriptions that northern Syria was a centre of culture and Aleppo a famous cult foundation as early as the first part of the third millennium B.C.; from Egyptian and Assyrian inscriptions and from the Hebrew scriptures we learn of numerous important cities throughout Syria in the succeeding pre-Christian millennia and especially of Damascus. From Greek and Roman sources we know of the mighty cities of this region in the early Christian centuries and particularly of Antioch. Surface exploration also has brought evidence of the boundless prosperity of Syria in those ages and almost countless ruin mounds dot the whole country; but so far as excavation is concerned Syria is as yet practically virgin soil.

Asia Minor.—The famous excavations of Schliemann at Hissarlik, the site of ancient Troy, gave us our first glimpse of the civilization of the Mycænæan period and showed us the existence of long eras of succeeding cities, going back certainly into the third millennium B.C., Troy being an outpost on the north of that brilliant Ægean, pre-Grecian civilization which seems to have bloomed at its richest in

Crete in the middle of the second millennium B.C. Excavations at Pergamos, Assos, Ephesus and Sardis with smaller excavations at Cyzicus, Halicarnassus and elsewhere, conducted by English, Germans, Americans and Austrians, have revealed remains of the later Greek and Græco-Roman periods. Only at Sardis, where the Americans, under Howard Crosby Butler of Princeton, explored on a magnificent scale for five years (1909-14), until their work was stopped by the war, were remains found of an earlier Asian culture, in the shape of inscriptions in the as yet undeciphered Lydian language. Since Texier published his '*L'Asie Mineure*' (1841) various scholars have explored and described surface remains from all parts of the country. Among the most noteworthy of these are the excavated rock cones existing by thousands in Cappadocia (described by Sterrett, Wolfe expedition, 1888). From Cappadocia also there have been brought, since 1887, a number of clay tablets with cuneiform inscriptions, which show the influence of Babylonian civilization and culture in Asia Minor as early as the latter half of the second millennium B.C. Further eastward, through Armenia, inscriptions have been found in cuneiform characters, cut in the rock, partly in the Assyrian language and partly in the native language of the country, which have now been deciphered, giving evidence of the existence of powerful kingdoms in that region in the 10th century and thereabouts, rivals at times of the Assyrian power.

Explorations by various travelers of the interior portions of Asia Minor revealed, besides numerous Greek and Latin inscriptions of the Christian and classical period, rude figures and hieroglyphic inscriptions cut in the rocks or carved out of stone, from the Mediterranean on the west to Armenia on the east and from a point a little south of the Black Sea on the north far into Syria on the south. By comparison with similar inscriptions and carvings found at Carchemish, known to be a Hittite capital, these were assumed to be Hittite and to show that Hittite power and influence covered a wide territory, comprehending a large part of Asia Minor and northern Syria. One of the finest Hittite inscriptions was found by the Germans at Babylon and the Bible records mention Hittites in southern Palestine at and long before the Hebrew conquest. Egyptian inscriptions testify to a great Hittite empire which disputed with Egypt the possession of Syria from the close of the 15th to the close of the 13th century. The Assyrians record a struggle with powerful Hittite states in northern Syria from the 10th century on, culminating in the capture and destruction of Carchemish, in 717 B.C. Finally, excavations in 1906-07 at Boghaz-Keui, the ancient Hatti, in northern Asia Minor, by the German scholar, Winckler, furnished us with a great number of clay tablets in cuneiform script, some in the Babylonian, some in the Hittite language and some bilingual, containing among other things the Hittite version of the famous treaty between Rameses II, Pharaoh of Egypt, and Hattusil, emperor of the Hittites, 1271 B.C. This discovery seems at last to have solved the Hittite problem, and to enable us to form a general idea of the early history of Asia Minor: along the coast a fringe of Ægean culture; in the interior various Asian peoples of language and

connection unknown to us; Babylonian commerce and culture penetrating into Cappadocia in the latter part of the third millennium; Indo-European invasions from the north by a horse using, chariot driving people, the formation of new states under their domination, the invasion of Mesopotamia, and the sack and destruction of Babylon and Ashur early in the second millennium. This resulted in the establishment of the Kassite dynasty in Babylon, of the kingdom of the Mitanni in Mesopotamia, of the foundation of the great Hittite culture and empire, extending finally over all Asia Minor, and the first encroachment of Indo-Europeans on the Ægean civilization in the capture and occupation of Troy. The Hittite empire reached its culmination in the 15th century B.C., when it was reaching out beyond Asia Minor southward, struggling with Egypt for the possession of Syria. Apparently even at this time, however, the Hittites were subjected to a pressure from behind, driving them southward. The empire of Hatti comes to an end about 1200 B.C., and the Hittites are pushed out of Asia Minor by the Muski; but until the close of the 8th century a number of Hittite states exist in northern Syria, contending with Assyria for the supremacy of that region. Of the following movements in Asia Minor and of the history of that country we have knowledge only from Assyrian inscriptions, and those rock-cut inscriptions of the people of Armenia to which reference has already been made. Asiatic peoples, some of whom have left us a few little fragments sufficient to determine the fact of their existence and our ignorance of their language, struggled with one another and with the Assyrian invaders. Finally in the 7th century one of these peoples, the Lydians, established a great empire with its seat at Sardis, while the Greeks occupied that fringe along the coast formerly occupied by the Ægean civilization; and Indo-Europeans pushing in from the East occupied Armenia. So far research has enabled us to outline the history of Asia Minor before written history begins.

Arabia.—Up to the present time no work of excavation has been conducted in Arabia. Various travelers have explored and mapped the country, from the time of the Danish Niebuhr (1761-64) onward. These include Burckhardt (1814-16), Burton (1853, 1877-78), Palgrave (1862-63) and others. These earlier travelers explored the country, visited Mecca and studied Arabic life and habits, but did little in the way of collecting or copying inscriptions. This was done principally by Halévy (1870-71), Doughty (1876-78) and Glaser (1882-94) in the south, and Euting and Huber (1883-84) in the north. These explorations were conducted under the greatest difficulties. Halévy traveled as a poor Jew; Doughty lived as a Bedouin; others professed Islam to accomplish their purpose; some, like Huber, lost their lives at the hands of fanatical natives. The inscriptions collected by Euting in northern Arabia show us the Aramæans inhabiting that region in the 6th century B.C. The inscriptions from southern Arabia reveal the existence there as early as 1000 B.C. of civilized peoples using alphabets derived from the so-called Phœnician alphabet. We are able to trace the successions and names of certain kings and peoples, and some light has been thrown on the ancient

religion and religious practices of the Arabs. Shortly before the beginning of the Christian era commenced the movement from Arabia of the Nabatæans, who occupied eastern Syria as far northward as Damascus, their chief centre being Petra. These were followed by another movement in the first centuries of our era, which established the Lakhmid state on the western confines of Babylonia, and the Ghasanid on the eastern confines of southern Syria. Beyond this, research in Arabian antiquities has not proceeded up to the present time.

General Results.—The general results of oriental research in Egypt and western Asia, covering in all a period of somewhat more than a century, have enabled us to trace the history and development of civilization from about 7000 B.C. At that time, research has now shown, there existed independent centres of civilization in Egypt and Babylonia, which countries were occupied by city-building and civilized peoples. By the middle or end of the fourth millennium a conventionalized script had been developed out of picture writing, independently in each of these countries, and the civilization of each region had assumed those definite types which we know respectively as Egyptian and Babylonian. From this point on we have in both cases written records, but no well-determined system of chronology until much later. The civilization of Egypt, while attaining in the matter of art, architecture and literature a very much higher development than that of Babylonia, was always singularly self-centred. Babylonia was more concerned with practical life, and the application of knowledge to material conditions. Babylonia, moreover, was always in contact with the world about it, and its civilization affected the civilization of surrounding regions to such an extent that it may fairly be claimed as the ancestor of later Western civilization. Egypt gave little to the outside world and received little from it, but, on the whole, what it received was greater than what it gave. It is Egyptian art, the painting on the Egyptian tombs, which gives us a vivid picture of the manner of Egyptian life; it is the innumerable clay tablets and business documents of Babylonia which enable us to restore in detail the laws, rules, customs and commerce of the Babylonians.

The earliest civilization of Babylonia was non-Semitic, developed among the people of the south, commonly designated as Sumerian. The earliest inscriptions are written in the Sumerian language, and even as late as the Assyrian time magical and religious texts continued to be written in the same tongue. By 3000 B.C. the Semitic peoples of Akkad, or northern Babylonia, had adopted and adapted the civilization of Sumerian Babylonia, and this Sumerian Semitic civilization became by the middle or close of the third millennium B.C. to all intents and purposes the civilization of the whole region from Persia on the east to the Mediterranean on the west.

In the first half of the second millennium Egyptian and Babylonian civilizations were brought into contact with one another, and with another civilization of equal rank and almost equal age which had developed to the west and north. By the 15th century B.C. a period of high culture, having several independent centres, was attained in this ancient world.

One of these was the Mycenæan or Ægean civilization, having its central point in Crete and the islands and shores of the Ægean Sea. So far at least as Crete was concerned, this had its own system of writing, which has not yet been deciphered. Another centre was Egypt, at this period politically dominant in Syria, although the civilization and culture of the latter region continued to be Babylonian. Another centre was Babylonia, which had communicated its writing, its religion and its art to the neighboring regions of Elam, Mesopotamia, Syria, Assyria and, to some extent, Armenia and eastern Asia Minor. Still another was the Hittite in Asia Minor, which was, however, ruder than the rest. At this period a belt of civilization seems to have extended vaguely from China on the east to Spain on the west, and from the Danube on the north to Nubia on the south; but the highly civilized portion consisted only of the territory from Elam to Greece, and from the Hellespont to Ethiopia.

Then came a catastrophe similar in cause and result to the Dark Ages which followed the brilliant period of the Græco-Roman civilization in the 4th and following centuries of our era. Barbarians, acquainted, however, with the use of iron, which made them formidable to the copper-using civilized peoples, pressing in from the north, overwhelmed the Mycenæan-Ægean civilization, reduced Egypt to a condition of depression, and for a time almost annihilated both Assyria and Babylonia. The movements of the northern peoples, driving southward and rendering foot-loose Ægeans and Hittites, forced these into the Semitic countries, expelling in turn from their homes the Aramæan hordes, who as Habiri passed into Palestine, and as Suti into Mesopotamia and Babylonia. These Dark Ages may be said to have come to an end about 1000 B.C. At least at that time a new civilization begins to dawn. As to the Dark Ages of the Christian era we owe two great discoveries, one material and the other spiritual, which largely changed the character of the succeeding civilization, namely, gunpowder and the printing-press, so to these Dark Ages of the earlier time we owe the discovery of iron, or perhaps its adaptation to practical use, and the invention of a real alphabet, the so-called Phœnician, two discoveries which conditioned the new civilization that came into being at or about 1000 B.C. Out of these Dark Ages developed on the spiritual side the religion of the Hebrews, and on the economic cultural side the Aramæan race of middle men, which so greatly helped by its common tongue and its international commerce to weld all Hither Asia into one, and to prepare the way for amalgamation in that great world culture which developed westward in Greece and Rome from 500 B.C. onward.

JOHN P. PETERS,

Author of 'Nippur or Explorations and Adventures on the Euphrates,' etc.

ORIENTATION, the adjustment and maintenance of itself by an organism in its proper position toward its environment; the acts of perceiving, assuming and controlling its normal attitude and movements in reference to gravitation, direction, equilibrium and other requirements of its relations to space. The ability to keep right side up, to face or move in a determined direction, to place one's self as a whole in any desired attitude, to bring the various parts of the body into definite relations with other parts, to maintain equilibrium, and con-

stantly to control and utilize this power, are the elements of the faculty of orientation, which seems in some degree necessary to every living thing, and whose phenomena in their higher manifestations surpass present human powers of explanation.

The faculty is essentially a mental perception of a necessity for a muscular act; but so incessant and habitual is it, at least in animals possessing the power of moving, that its exercise is ordinarily unconscious, and belongs to the realm of automatic reflexes, or at least to that of subliminal consciousness.

The proof of this appears in the partial inability of young animals, notably of the higher classes, to adjust themselves to their surroundings. Babies have to acquire a knowledge of relative direction, distance and proportion by slow degrees. So simple a matter as bringing the hand to the mouth must be learned; the first difficulty in learning to walk is to acquire the power of maintaining equilibrium; and this must be acquired anew when a grown person attempts some novel method of locomotion, as skating or the riding of the bicycle. Proof appears also in the loss or destruction of the power of orientation which follows the derangement of the brain or nervous system by certain drugs or diseases. A symptom of intoxication is staggering, and when the intoxication is excessive ability to stand or to use the limbs definitely disappears,—the power of co-ordination is lost. Some forms of insanity have a similar effect; and a characteristic of the disease locomotor ataxia is that it deprives its victim of the power of control of equilibrium (q.v.) and of the muscles used in walking; it is not muscular weakness but disorganization of the power of co-ordination. If the affected person is able to walk at all he finds it impossible to turn without falling; or when he moves will start off at right angles to the course he intended to take. A similar defect of power accompanies great sleepiness—our heads droop and we totter and progress aimlessly until well aroused. Persons walking in the dark, with nothing to guide them but the touch of the feet upon the floor, find it hard to walk straightly or firmly. Orientation, then, that is the power to maintain a proper relative attitude, to comprehend direction, and to control locomotion, depends originally upon sensation and experience, combining many factors, both psychical and physiological, often not easily separable.

At the basis lies the faculty for equilibrium, the ability to feel and to keep one's self right side up. It is a notable fact that animals stricken with death when free to turn, as are those in the water, turn upon their backs—the part of the body that in life is kept away from the ground. This is a matter of gravity—the dorsal half of the body is the heavier. How do such creatures as fishes and low marine animals know how to resist this inclination in life, and hold themselves in the opposite or whatever may be their normal attitude toward the plane of the horizon? The only explanation is that they possess a sense of equilibrium which is supposed to reside primarily in certain organs, whose office is supplemented by various sensations, as of feeling, sight and hearing, the influence of each varying in proportion according to the degree of nervous organization of the

animal, its structure, size, shape, the medium in which it operates, etc. In the case of man and the animals nearest to him, balance is maintained by constant muscular response—in large part unconsciously, of course—to the sensations of tension and pressure in muscles, tendons and joints; to the wavering suggestions of pressure upon the soles of the feet or upon the bones and flesh of this side of the body or that, as the weight is shifted; to suggestions from the eyes with reference to fixed objects, or from the ears as sounds vary in intensity, or even from the interior of the body, where organs or contained fluids report movements which must be corrected to restore the centre of gravity. The broad examples of this, which are matters of commonplace experience, such as the leaning away from a weight carried in one hand, or the outstretching of an arm to counteract a slip of the foot, or the swerving outward when rounding a curve at a rapid pace, are only large illustrations of the minute adjustments which go on incessantly in maintaining the equilibrium of animals. Underlying these adjustments, however, is the faculty, before alluded to, of perceiving when the body is in equilibrium, and this is believed to reside especially in certain organs represented in man by the labyrinth of the ear, and in the lower animals by the homologues or analogues of this structure. These are sufficiently described and illustrated in the article EAR, and consist essentially of some movable particle at the end of a nerve-filament, which, by its change of place as the body moves, informs the mind of the direction and degree of the departure from a state of equilibrium. Prominent among these special organs are those of the lateral line in fishes, whose perceptions of vibrations make them akin to organs of hearing; but the higher purpose of which is believed to be equilibrial. With these and similar organs in the lower ranks of animals the complicated labyrinth of the ear in the higher vertebrates and in man is allied by descent; and unquestionably the semi-circular canals are the seat of our perception or sense of levelness, change of direction, relative position, acceleration of movement, rotary motion, and all the rest. The orientation of the body thus depends primarily upon the index furnished by the inner organs of the ear.

Whether this is to be regarded as a "sixth sense," as it is often styled, is by no means clear; but some of the manifestations of the power of animals and some men to perceive, take and keep a course in the entire absence of anything in the way of guidance visible to human understanding, transcend our power of explanation at present. The extraordinary faculty which savages have inherited from primitive men of finding their way through extensive forests or over wide plains that present no landmarks cannot be explained by the men themselves—they say they *feel* that the direction they follow is the right one, and become uneasy when they deviate from it. A similar explanation will alone account for the unerring manner in which birds migrate across hundreds of miles of open ocean to some island or point of coast annually revisited. See EQUILIBRIUM; TROPISMS.

The literature of the subject is mainly French and German, the latest summary being

Hartmann, 'Die Orientierung' (Leipzig 1902); and Loeb, 'Comparative Physiology of the Brain' (New York 1902). Consult also Watson, J. B., 'Behavior' (New York 1904).

ORIENTE, Cuba, the extreme eastern province formerly Santiago de Cuba (q.v.).

ORIFLAMME, or **AURIFLAMME**, the former royal standard of France, originally the church banner of the Abbey of Saint Denis, and borne by the counts of Vexin, patrons of the church. It was presented by the abbot to the lord protector of the convent whenever it was necessary to take up arms for the preservation of its rights and possessions. It was a piece of red taffeta fixed on a golden spear, in the form of a banner, and cut into three points, each of which was adorned with a tassel of green silk. When Philip I afterward united Vexin to the possessions of the crown, it fell to him to bear the banner as protector of the abbey. It was then carried with the armies, and eventually became the great standard of the kingdom. Since the time of Charles VII it has never been carried into battle.

ORIGEN, ôr'i-jên, ecclesiastical writer, surnamed ADAMANTIUS: b. Alexandria 185; d. Tyre 254. He was early instructed by his father in the Christian religion. His teachers were Clement of Alexandria and Ammonius. In his early youth he gave proofs of greatness of soul. When his father was thrown into prison during the persecution of Severus, Origen exhorted him to die rather than apostatize. After the martyrdom of his father in 202 he maintained his mother and sister by giving instructions in grammar. At 18 he was appointed to instruct the believers in Alexandria. Males and females crowded to his lectures. To escape calumny he mutilated himself, thinking the act justified by the New Testament, though afterward he expressed sorrow for the act. After the death of Severus (211) Origen went to Rome, where he gained friends and admirers, and subsequently, at the request of Bishop Demetrius, continued his instructions at Alexandria. A popular tumult compelled him to flee to Palestine (215). He was permitted by the bishops there to preach in their assemblies, afterward returning to Alexandria. On his way to Cesarea, in Palestine (227), he was ordained presbyter by the bishops who were there assembled. This laid the foundations for the persecutions which embittered the remainder of his life. Demetrius maintained that he alone had the right to ordain Origen. He deprived Origen of his priestly office, prohibited him from teaching in Alexandria, whither he had returned, banished and excommunicated him. This sentence was confirmed at Rome and by most of the other bishops. But the Churches of Greece and Asia sustained Origen, who denied that he was guilty of the errors of which he was accused. In the year 231 Demetrius died, and Origen enjoyed tranquillity. The persecution under Maximin forced him to remain for two years in concealment. When peace was restored to the church in 237, he took advantage of it to travel to Athens. He then went to Arabia to refute Bishop Beryllus, who affirmed that the divine nature of Christ did not exist before his human nature. Beryllus recanted, and thanked Origen for his instructions. In the Decian persecution Origen was thrown into

prison, and subjected to the extreme sufferings, from whose severity he died.

Few authors have written so much as Origen; few men have been attacked with such virulence, both during his life and after his death. He was reproached with blending the Christian doctrines with Platonism, particularly in his book, 'De Principiis'; but he gives his opinions only as a possibility; moreover, "heretics," he says, "corrupted his writings." He has been accused, without reason, of favoring materialism. His double achievement was to "destroy gnosticism and to give philosophy a recognized place in the creeds of the Church." Of his works, besides the one just mentioned, there are extant only his 'Exhortation to Martyrdom,' commentaries, homilies and scholia on the Holy Scriptures, nothing more of which we have than free translations. His critical talent is shown in his 'Hexapla,' of which an edition was published by Montfaucon, and afterward by F. Field (1875). In 1896 further portions of the 'Hexapla' were found at Milan. His work against Celsus is the most complete defense of Christianity of which antiquity can boast. His works were edited by Lommatzsch in 25 volumes; the most recent edition has been issued by the Berlin academy. Consult Begg, 'Christian Platonists of Alexandria' (1886); Fairweather, 'Origen and Greek Patristic Theology' (1901); Freppel, 'Origène' (1868); Harnack, 'History of Dogma' (Vol. II, 1899); Möller, 'Geschichte der Kosmologie der Griechischen Kirche bis auf Origenes' (1860); Thomasius, 'Origines'; the volumes in the 'Ante-Nicene Fathers' series; and the 'Encyclopedia of Religion and Ethics' (1917).

ORIGIN OF SPECIES BY MEANS OF NATURAL SELECTION, a remarkable work by Charles Darwin, published in London, 24 Nov. 1859. In it the author expounded the famous theory known as Darwinism. The book created a profound sensation not unmixed with consternation. A torrent of anathema was poured over the head of the scientist whose patient observations in the great laboratory of nature had led him to the now generally accepted doctrine of Evolution. Theologians and laymen prophesied ruin to religion and morality if that doctrine were accepted. Nevertheless the work, slowly at first, but with increasing rapidity, made its way to general recognition and more or less qualified acceptance, and its anathematizers were gradually constrained to find a *modus vivendi* between their creeds and the theories propounded in the 'Origin of Species.' The revolution in scientific doctrine and scientific method brought about by the publication of this work was so far-reaching that 21 years after its appearance Professor Huxley declared there was no field of biological inquiry in which the influence of the 'Origin of Species' was not traceable; that the foremost men of science in every country were either avowed champions of its leading doctrines, or at any rate abstained from opposing them. But it is not only in physical and natural science that the influence of this work can be traced to-day; it has been said, perhaps prematurely, that one must seek back to Newton or even Copernicus to find a man whose influence on human thought and methods of looking at the universe has been as radical as

that of Darwin. His originality has been assailed; Lucretius, Kant, Laplace, Buffon and Erasmus Darwin (grandfather) have been brought forward as the real originators of the fertile idea which has taken its name from Charles Darwin. Undoubtedly, he received inspiration from a study of what had been done by his predecessors, but whereas the old theories produced no results, those of Darwin had a mature vitality that compelled recognition.

ORIGINAL SIN, the sin which all the descendants of Adam inherit from their first progenitor. The doctrine of Original Sin is a first postulate of Christianity in the scheme of man's redemption by Christ. The first explicit statement is to be found in Saint Paul (Rom. v. 12 et seq.): "As through one man sin came into the world, and death by sin, and so death penetrated to all men, because all sinned . . . for if by the trespass of one the many died, much more the grace and the gift in the grace of the one man Jesus Christ abounded to the many." The ante-Nicene Greek Fathers say little about the doctrine, and this only incidentally. When they do mention the subject it is always in the spirit of Saint Paul's statement, that all mankind fell in Adam, and that through this first sin death entered into the world, the will became weakened, reason obscured, and concupiscence disordered. There is also little to be gathered from the Latin Fathers of the ante-Nicene Age, for the doctrine had not become the subject of controversy, and so awakened but slight theological discussion or formulation. Wherever mentioned by them, the prevailing idea at bottom was the Pauline doctrine of the fall of the human race in Adam, with its dire consequences, which are to be remedied only by the grace and merits of Christ.

Saint Augustine (q.v.) was the first Latin Father to treat it systematically and extensively in his controversy with the Pelagians in relation to grace, free-will, predestination, etc. His teaching is succinctly stated in the following passage: "He (Adam), exiled after sin, bound his offspring also, which by sinning he had corrupted, as it were in the root, under the penalty of death and condemnation, so that all progeny born of himself and his wife . . . should draw to itself original sin, and thence be drawn through diverse errors and pains to that last and endless torture with the angels, who deserted and corrupted (others), and with those who inherit and share in their portion." (Euchirid. ch. 10). Saint Augustine's exposition of the doctrine exercised a great and lasting influence throughout the subsequent centuries, and has been, in its broader outlines, followed by the theologians of the Middle Ages. A more definite and scientific formulation grew up with the development of the stricter methods of scholastic philosophy, which reached its complete expansion in the 13th century. Saint Thomas Aquinas (q.v.), the greatest theologian of the scholastic period, declares that the essence of original sin consists in the "privation of original justice," understanding by original justice that state in which Adam was created and lived prior to the fall, with all the gifts of grace which God had bestowed upon him with the view to his supernatural end in ultimate possession of the Divine Vision. All this Adam forfeited when he fell, and that forfeiture passed by natural

generation to all his descendants. In this view original sin is not a positive evil added to human nature, but the deprivation of a supernatural good originally bestowed upon the race in the headship of Adam. Following this original loss, as a penalty of Adam's transgression, came the direful consequences of death, the confusion and disorders of all the human faculties, and the sting of concupiscence. This is the accepted teaching of the Roman Catholic Church, and the Council of Trent defines as of faith, that Adam lost original justice, not only for himself, but also for us; that he "poured sin, which is the death of the soul, into the whole human race," and that this sin comes, not by imitation of Adam's transgression, but by propagation from him.

The reformers of the 16th century generally held to a very strict interpretation of the Augustinian view, and regarded original sin as a complete corruption of the will and reason. Luther held that it consisted in concupiscence. The Lutheran and the Reformed Churches both held similar views regarding original sin, following Calvin rather than Zwingli, who looked upon it as an evil or disease, and only as a sin when a commandment was thereby transgressed. The Arminians and Socinians, on the other hand, discountenanced the ecclesiastical view of the doctrine. While the Protestant Church maintained that Jesus alone was absolutely free from original sin, the Roman Catholic Church exempts the Virgin Mary from its dominion. Uniform adhesion to the Augustinian dogma on the part of the reformers was by no means the case. From Luther's dispute with Erasmus, who would only admit a weakness of the free-will and not its destruction, up to the present time the doctrine has been variously defended and attacked, philosophers as well as theologians taking part in the controversy. Kant showed the moral signification of the doctrine, and represented original sin as an inherent tendency in man's nature to evil. Rationalism, on the other hand, taught with Pelagius that it was only a weakness of man's nature with regard to knowledge and his power for good. According to Hegel original sin is nothing else than the necessary finitude and limitation of our nature. In recent times orthodox theologians, such as Olshausen, Hengstenberg and others, have stood up for the Augustinian doctrine, while those of the liberal school have modified it in various ways. Consult Clemm, 'Christliche Lehre von der Sünde' (1897); Fisher, G. P., 'History of Christian Doctrine' (New York 1896); Harnack, A., 'History of Dogma' (Boston 1897-1900); Tennant, F. R., 'Sources of the Doctrine of the Fall' (New York 1903); Tulloch, John, 'Christian Doctrine of Sin' (New York 1877); Hodge, 'Systematic Theology' (1871); MacKintosh, R., 'Christianity and Sin' (New York 1914); Landis, 'Doctrine of Original Sin' (1885); Müller, 'Christliche Lehre von der Sünde' (1888).

ORIGINS OF CONTEMPORARY FRANCE. The. 'The Origins of Contemporary France,' like his work in criticism and philosophy, exemplifies certain general conceptions which Hippolyte Adolphe Taine (1828-93) put forth insistently from the beginning to the end of his career. Man is not a free agent. His course of action is determined by great unconscious forces or pressures, such as race,

environment, and his relation to the past. A religion, a work of art, a form of government, do not represent free creations and free choices of the human spirit. They are products just as the compounds in a chemical laboratory are products, the result of combinations of elements, and they should therefore be studied scientifically.

It was the results of the Franco-Prussian War that deflected Taine's attention from more purely literary and philosophic studies to a consideration of the unhappy state of his own land. France had been conquered, the empire suddenly and unexpectedly overthrown, the Commune had started to revive the excesses of the revolution. What was the destiny of France? Through what form of government could the forces that are France most effectively express themselves? These were the questions which forced themselves upon him. They could be answered only by a study of the past, and Taine began to apply to the history of his country the method and the theories which he had already applied to literature.

In the many volumes of this history he was therefore treating France as a parallelogram of forces of which he was to find the diagonal. In the French Revolution these forces which were to make or wreck his country had been released and could be studied in freest play. But before beginning his study of the Revolution proper he summed up the social and political situation as it existed in France in the 18th century in what has been generally recognized as the most brilliant portion of his work, the volumes on 'The Old Régime' (l'Ancien Régime), which were to deal with the 18th century and the marshalling of the forces that brought on the cataclysm.

Taine loved startling effects, and they were here ready to his hand. On the one side he had the brilliant and sumptuous life of the court, on the other the misery of starving peasants. The greatest economic, social and political upheaval in history was impending, and in the minds of the philosophers were being prepared the new doctrines that were to hurry in the climax. Taine's powerful imagination and extraordinary command of style gave this stupendous drama a presentation worthy of the theme and of the writer.

He was now ready to make his study of 'The French Revolution' which to him was a conflict of ideas and forces rather than of individuals. The rôle of the revolutionary leaders is therefore subordinated; for the most part they are carried along by movements which they are powerless to check and unable to guide; and the implication everywhere is that the cataclysm was the result of lack of any strong central control. A rereading of these volumes to-day shows how close a parallelism is presented between the work of the Jacobins in France and that of the Bolsheviks in the collapse of Russia. 'The Modern Régime,' the least interesting section of his work, was the title of the later volumes which carry us on only into the early period of the 19th century.

Taine's enthusiasm for the method of science led him to claim that he worked with entire detachment and studied the transformation of France as a naturalist studied "the metamorphosis of an insect." His own conclusions on life and his theories of development were, how-

ever, so strongly held that he most readily found in history what his theories had led him to seek. As artist and master of style, he outranks any of the later French historians. His theories on historical method were powerfully to influence his successors, though many of them, less strong in temperament and philosophic bias, were to cover the same ground more thoroughly if far less brilliantly than their master whom they frequently disowned. Nor was his influence confined to historians. The naturalistic novelists like Zola were only too willing to assume the dignity of "scientists" after having regarded the life of their hero or heroine as a naturalist regards "the metamorphosis of an insect."

The validity of Taine's historical work and the sufficiency of his erudition have in the present century been frequently impugned by historians more methodical but less gifted. The most important of these attacks on Taine is the volume of Aulard, 'Taine Historien de la Révolution Française' (1907). For a French estimate of Taine consult Giraud, 'Essai sur Taine' (1909, 4th ed.).

CHRISTIAN GAUSS.

ORIHUELA, ō-rē-wā'la, Spain, city in the province of Alicante, 13 miles northeast of Murcia and 15 miles from the Mediterranean, on the Murcia-Elche Railway. The town extends on both sides of the river Segura and is situated in a very beautiful and fertile region. The town was captured by the Moors in 713, and was recaptured by James I of Aragon in 1265. It is the seat of an episcopal see and has an episcopal palace dating from 1733. There is also a Gothic cathedral of the 14th century, and a town hall with important archives. It formerly possessed the University of Orihuela but this was closed in 1835. It has a normal school and a theological seminary. The surrounding district produces fruit, wine, oil and cereals and the town has a considerable trade in them. It also manufactures silk, linen and woolen fabrics; and has tanneries, dyeworks and oil and flour mills. Pop. about 35,072.

ORILLIA, ō-ril'li-a, Canada, town and port of entry of Simcoe County, Ontario, on the west shore of Lake Couchiching, on the Grand Trunk, Canadian Northern and Canadian Pacific railways, 86 miles north of Toronto, 28 miles northeast of Barrie. It is a favorite fishing and summer resort. It has an opera house, collegiate institute and a provincial lunatic asylum is located there. It enjoys a thriving trade in lumber and farm produce; has manufactures of leather, foundry products, lumber, shingles and planing and grist mill products; and has electric light, water and sewerage systems. Pop. (1921) 8,910.

ORINOCO, ō-ri-nō'kō, Venezuela, one of the three great South American rivers, rising in the Sierra Parima, on the Brazilian frontier, near lat. 3° 40' N., long. 64° W., and after a winding course of over 1,500 miles, during which it forms part of the boundary with Colombia, flowing into the Atlantic through a many-mouthed delta between long. 60° 20' and 62° 30' W., opposite the island of Trinidad. The area of the drainage basin is estimated at 368,600 square miles. Its exact sources were not discovered until 1886. It flows at first west by north, a mountain stream, as far as long.

67° W. A little below Esmeralda, in long. 65° 50' W., it divides and sends off to the south, the Cassiquiare, a natural canal 180 miles long with a rapid trend to the Rio Negro, a tributary of the Amazon. The Orinoco and Amazon are also connected by the Pimichin stream and the Terni branch of the Atabapo, an affluent of the Orinoco. Other important tributaries are the Guaviare, the Meta, Apure, Arauca, Caura and Caroni. Two remarkable rapids occur in the upper parts of the Orinoco, called the Atures and Maypures, the one in lat. 5° 8' N., the other about 36 miles lower down. These rapids consist of a countless number of little cascades succeeding each other like steps, and, where numerous, islands and rocks so restrict the bed of the river that out of a breadth of 8,000 feet there only remains an open channel of 20 feet. From these rapids the river is navigable to its mouth, a distance of about 870 miles.

At 600 miles from the ocean it is from 5,000 to 6,000 yards wide; at Angostura or Ciudad Bolívar, 370 miles from its mouth, 7,500 yards; and in March 65 fathoms deep. About 120 miles from the Atlantic its delta of 8,500 square miles begins. Of upward of 50 mouths which reach the ocean along 165 miles of coast line, only seven are navigable. The waterway principally used by ocean-going vessels, which penetrate up to Ciudad Bolívar (Angostura), is Boca de Navios, varying in width from 3¼ to 23 miles. Most of the larger affluents are also navigable for considerable distances, the Meta, for instance, to within 60 miles of Bogotá. As a rule the river floods the districts adjoining its banks from May to January, the country under water sometimes measuring 100 miles across. The magnificence of the scenery on the banks of the Orinoco is beyond description. Forests of great extent are filled with aromatic trees; birds of beautiful plumage are common, and hordes of monkeys disport themselves among the branches. Beyond these forests enormous plains extend their verdant surfaces farther than the eye can reach. The whole course of the main stream is in Venezuela, except where it forms the boundary between Venezuela and Colombia. Consult Guzman, 'La exploración del Orinoco' (in 'La España moderna,' Madrid 1902); Humboldt, Alexander von, 'Travels in South America' (London 1877); Mozans, H. J., 'Following the Conquistadores: Up the Orinoco and Down the Magdalena' (New York 1910); Triana, S. P., 'Down the Orinoco in a Canoe' (London 1902).

ORIOLE, any of certain passerine birds, distinguished by the predominance of a golden hue in their colors. The orioles of the Old and New Worlds belong to quite distinct families. The American orioles constitute, with the black-birds, the meadow-larks, boblinks and cowbirds, the family *Icteridae*, of which they are often considered to form a subfamily (*Icterinae*) and which is related on the one hand, through the meadow-larks, to the starlings (*Sturnidae*) of Europe and on the other, through the boblink, to the finches (*Fringillidae*). From the other members of the family the orioles may be distinguished by the slender, acute, slightly decurved bill, small, weak feet and the strongly contrasting black with yellow, golden or reddish colors of the males and the

usually plainer females. Practically all of the 40 or so species of American orioles belong to the typical genus *Icterus* whose species abound in tropical America, where they are called troupials, caciques, or banana birds. Within the limits of the United States seven species occur, but three of these are really Mexican birds which wander over our southwestern border and another is a rare straggler from South America. Several of the tropical species are imported as cage-birds. The Baltimore oriole, golden robin or hangnest (*I. galbula*), the male of which is about eight inches long and bears the rich golden and black colors of Lord Baltimore's livery, is one of the best known and most conspicuous migratory birds of the east. It occupies the entire territory east of the Rocky Mountains and northward into Canada and in winter migrates to Central and South America. From the Rocky Mountains to the Pacific it is replaced by the closely related *I. bullocki*. The Baltimore oriole is noted alike for its great beauty, its vivaciousness, its clear, loud whistle constantly repeated in May and June and its skilfully woven, pensile nest, formed of grasses and fibres and suspended from the endmost twigs of high branches, often of elm and sycamore trees.

The orchard oriole (*I. spurius*) has a similar range somewhat curtailed northward and westward. It is a smaller bird and the adult male is black and reddish chestnut, but assumes these colors only when three years old; the young male resembles the female in being olive-green and dull yellow, but in the second year has a black face and throat. In habits it generally resembles the Baltimore oriole, but it is pre-eminently a denizen of orchards and its song, nest and eggs all present specific differences.

The orioles of Europe and of the Old World generally, except Africa, belong to the family *Oriolidae*, which is related to the birds-of-Paradise. The best known species is the golden oriole, which has a stout bill and bright yellow plumage with black wings and tail. Like our orioles it constructs a hanging nest. Certain species of orioles of the genus *Mimeta*, inhabiting islands of the Malay Archipelago, so exactly resemble associated species of friar-bird (*Philemon*) that Wallace considers them to be true mimics. Consult American and European ornithologies generally; Jordan, 'Birds of India' (1862); Knowlton, F. H., 'Birds of the World' (New York 1909); Wallace, 'Tropical Nature' (1878).

ORIÓ, ò-rē-ôn, Philippines, a pueblo of the province of Bataán, Luzon, situated near the west shore of Manila Bay, five miles south of Balango. It is on the principal road of the province. Pop. 10,370.

ORION, ò-rí-ón, (1) in astronomy, one of Ptolemy's constellations and the most marked in the heavens. It is divided by the equator into two nearly equal portions. When the location of its bright stars is known, many of the surrounding ones may readily be found by alignments; (2) in Greek mythology, an heroic youth, son of Hyrieus of Hyria, though other origin has also been attributed to him. Eös became enamored of him. The gods were jealous of her love and Artemis at the command of the gods slew him with her arrows in the island of Ortygia. He was of such gigantic size that

when standing in the middle of the sea the water only reached his shoulders. According to another legend, he died of the sting of a scorpion. Various other legends of the hero are found in Greek mythology.

ORISKANY, ò-ris'kā-nī, Battle of, in American history, an engagement between the British and Indians and the American forces, near Oriskany, N. Y., 10 miles from Fort Stanwix, 6 Aug. 1777. The opposing forces each numbered about 800 men. The Americans, under General Herkimer, started to relieve Fort Stanwix, which was besieged by Saint Leger, Brant and his Indians. At Oriskany he halted and attempted to concert an attack and a sortie. The plan miscarried. Herkimer advanced and was attacked by the Indians and Tories in a deep ravine. The battle raged furiously for hours, despite a terrific thunderstorm and was one of the most cruel and bloody of the Revolutionary War. Each side lost a third of its number. The Americans remained masters of the field, although badly disabled. The sortie from the fort was a success and badly crippled the enemy. General Herkimer was mortally wounded in the battle and died several days later.

ORISKANY STAGE, in geology, the lowest group of the Devonian system, so called from Oriskany Falls, N. Y., northeast of Utica, and apparently the northern limit of the stage in New York, the name being due to the New York Geological Survey. In Maine it is several thousand feet thick, but is much thinner in western New Jersey, eastern Pennsylvania, Maryland, Virginia and West Virginia. It also occurs in Ontario and crops out in southern Illinois.

ORIZABA, ò-rē-sā'bā, Mexico. One of the chief cities of the State of Vera Cruz; situated 81 miles southwest from the port of Vera Cruz and 182 miles southeast from the City of Mexico, on the line of the Mexican railway, at the entrance to the coffee zone. Its elevation is 4,030 feet above sea level and its climate throughout the entire year is delightful. In the immediate vicinity are several cotton mills which combined, employ some thousands of operatives. Within the city limits are located the great Santa Gertrudis jute mills, owned in England, the Moctezuma brewery, cigar factories and a number of other industries and the Mendizabal hospital. In a nearby suburb are stone and marble quarries which annually supply enormous quantities of building material of very superior quality; and to the south, toward Cordoba, which is situated in the centre of the tropical fruit interest and tributary to Orizaba, are great sugar cane plantations and sugar mills. In the vicinity of Orizaba is a wealth of water power which is sufficient for every need, during a part of the year. The most notable structures are the State Normal School, completed at a cost of \$500,000, the City Hall, old Cathedral, cotton mills, jute mills, brewery and Hotel de France. The streets are all paved with stone. The street railway system extends several miles into the country in three directions. The Preparatory College maintains a technical museum and two public libraries—one connected with the Preparatory School and the other with the "Carcel Municipal"—12,000 volumes in all. Pop. about 48,000.

CHESTNUT-SIDED WARBLER (above). BALTIMORE ORIOLE (below).

ORIZABA, Mexico, a volcanic peak, 60 miles west of Vera Cruz, on the boundary between the states of Puebla and Vera Cruz. It was called by the ancient Mexicans Citlatepetl, or Mountain of the Star (from *citlalin*, star and *tepetl*, mountain), probably from the circumstance that "when in a state of eruption the flame at its summit appeared, when seen from a distance, like an immense star on the verge of the horizon," as one historian states: "but more probably because, on the side of the mountain, was a temple in pre-Columbian times, in which the 'sacred fire' was ever kept burning on the open top of the pyramidal structure, in full view of the inhabitants of the surrounding valleys." It has an altitude of 18,200 feet and is the first land visible on approaching the coast in the direction of Vera Cruz. Its most considerable eruptions known to history took place between 1545 and 1566. In common with the other great volcanoes of Mexico, Popocatepetl, Tuxtla and Jorullo, it seems to have lost most of its activity and to be in a state of repose.

ORKNEY (ôr-knî) ISLANDS, Scotland, an archipelago forming a single county, separated from the northern coast of Caithness, by the Pentland Firth, from six to eight miles broad. There are in all 67 islands of considerable size, with a number of smaller dispersed over the archipelago. They extend from lat. 58° 42' to 59° 23' N.; long. 2° 22' and 3° 25' W.; aggregate area, 390 square miles, or 249,565 acres, of which about 107,000 are under culture. Among the larger islands are Pomona or Mainland, Hoy, South and North Ronaldsay, Westray, Sanday, Eday, Stronsay, Ronsay and Shapinsay. Of the whole about 28 are usually inhabited, although five or six do not contain a dozen inhabitants each, the rest being islets too rocky to attract settlers. Hoy is the only island of the group that can be called mountainous and here the highest elevation is but 1,600 feet. With the exception of a granitic district near Stromness, the islands are of old red sandstone formation. The climate is moist, but not cold, being tempered by the Gulf stream that sweeps around the shores. Oats, turnips and hay are the chief crops and 16,000 acres of land are devoted to permanent pasture. The common breeds of sheep, cattle and horses were small, but since the introduction of good stock from the south, have become large and valuable. Rabbits and poultry are numerous. The herring and cod fisheries compensate in some parts the absence or defective development of other resources and large numbers of lobsters are annually sent to London. The principal manufactures are hosiery, made by the females and the building of boats, making of sails, nets and cordage. The chief town is Kirkwall.

As the Orcaes mention is made of the islands by several ancient geographers and classical writers, Ptolemy, Pliny the Elder, Mela, Solinus and others; the prehistoric monuments include the Stenness (q.v.) monoliths, the Maeshowe tumulus and a Pictish fort. It is probable that the Picts possessed the islands until the subversion of the Pictish kingdom in Scotland by Kenneth II. In 1099 they were assigned by King Donald Bane to the king of Norway and remained in possession of the Norwegians until the middle of the 13th cen-

tury, when Magnus, king of Norway, transferred them to Alexander, king of Scotland. In 1911 the population of the Orkney Islands was 25,897.

ORLANDO, Vittorio Emanuele, Italian statesman: b. 1860. A native of Sicily, he was for many years professor of constitutional law at the University of Palermo. In the Boselli administration he was minister of the interior. He was much criticized for the latitude he allowed the neutralist and pacifist agitators. Perceiving the danger of their machinations, he rigorously suppressed the movement. Succeeding Boselli in the premiership in October 1917, he gained prestige by the moral courage he exhibited at the time of the Italian disaster of the Caporetto. He organized national resistance to the Austro-German invasion and in a series of patriotic speeches sustained the spirit of the country. He was principal Italian delegate at the Inter-Allied Peace Conference in Paris.

ORLANDO, ôr-lăn'dô, Fla., city, county-seat of Orange County, on the Seaboard Air Lines, about 100 miles south by west of Saint Augustine. It is in a fruit growing region and its principal industries are connected with the marketing of the fruit of the surrounding country. Pop. (1920) 9,257.

ORLANDO FURIOSO ('THE RAGING ROLAND'), a romantic epic in *ottava rima*, by Lodovico Ariosto, is probably the most brilliant literary achievement of the Renaissance in the 16th century. The masterpiece of the great Ferrarese poet was begun about 1506 and was first printed in 1516. Originally in 40 cantos, constantly revised by the author, in its final form in the edition of 1532, published one year before Ariosto's death, it contains 46 cantos. Taking the popular subject and characters of Boiardo's 'Orlando innamorato' (q.v.), Ariosto completed the unfinished narrative of his predecessor and developed the poetic romance in Italy to its utmost perfection.

Boiardo's romance of chivalry had broken off at the point where the victorious pagan hosts were besieging Charlemagne in Paris. Ariosto conducts his poem to the final discomfiture of the Saracens and the triumph of the Christian world. From the Titanic fury of Orlando's jealous frenzy, the central episode of the poem, to the delightful idyll, the love of Angelica for Medoro, the cause of the hero's madness; from that exquisite extravagance, Astolfo's fantastic journey to the moon in search of his friend's lost senses, to the triumph of Discord in the Moslem camp, the poet, blending earnestness and irony in inimitable fashion, leads his charmed readers from one surprise to another. The desire to flatter his patrons, the militant ecclesiastic, Ippolito d'Este and the cardinal's brother, Alfonso I, Duke of Ferrara, caused Ariosto to emphasize the rôles of Ruggiero and Bradamante, the fabulous ancestors of the house of Este. Thus Boiardo's original protagonists, Orlando, Rinaldo and Angelica descend into secondary importance, while the trials and final union of Ruggiero, the paynim hero, and the virgin warrior, Bradamante, the sister of the Christian paladin, Rinaldo, become in the version of the courtier poet the main theme.

The charm of the narration, the beauty of the introductions, the wonderful variety of events, the magic of the style, captivated the public. Between 1536 and 1560 one editor alone brought out 30 editions of the 'Furioso.' Written for a later and more polished society, this fanciful epic shows a distinct progress in refinement, taste and restraint over Boiardo's romance. The elegant society of the day saw itself mirrored in the courtliness, the chivalric love, the perfect knighthood of the 'Orlando furioso.' Gifted in imagination and aesthetic sense, handling the *ottava rima* with masterly suppleness, harmony and variety of rhythm, Ariosto has produced in his poem, through its elegance, serenity and sheer beauty, the perfect expression of the later Italian Renaissance. Consult Ermini, Filippo, 'L'Orlando furioso' (critical text of the editions of 1516, 1521, 1532, Rome 1909-13); Rajna, Pio, 'Le fonti dell' Orlando furioso' (Florence 1900); Gardner, E. G., 'The king of court poets' (London 1906). The translation by Wm. S. Rose now to be found in Bohn's Library (London 1902-05) is superior to the older renderings of Harington or Hoole.

ALFRED G. PANARONI.

ORLANDO INNAMORATO ('Roland Enamored'), the most famous work of Matteo Maria Boiardo, is an Italian romance of chivalry in *ottava rima*. Begun about 1472, this vast narrative poem was interrupted at the end of the second book by the war between the Venetians and the Duke of Ferrara (1482). In the last 10 years of his busy life as a state official, Boiardo had added nine cantos to his third book, when the descent of Charles VIII of France into Italy and the death of the poet in the same year (1494) left his task unfinished. The incomplete work contains in all 69 cantos. Written for the brilliant court of Ferrara, whose sovereign, Ercole I, was Boiardo's patron, the 'Orlando innamorato' welded in admirable fashion the epics of Charlemagne and the romances of the Arthurian tradition. Borrowing from the Carolingian poems the ever-popular heroes of chivalry and from the Breton cycle the Oriental magic, the monstrous giants, the love potions and the supernatural characteristics of the Arthurian legends, Boiardo infused a new element by making love the central theme, a procedure that appealed immediately to the courtly and more cultured nobility of the Renaissance. Thus it is the love of Orlando and Rinaldo for the beautiful Princess Angelica of Cathay which is the main-spring of this lengthy epic. Added interest in the theme was found in the threat of the victorious Turks, who, under Mahomet II, had been menacing Italy at this very time. Pagans and Christians vying in friendly and in mortal rivalry, great infidel hosts attacking Christendom from every direction, marvelous adventures and mysterious expeditions to every clime, all the multitudinous episodes of the mediæval folklore are consummately united. The complicated plot is skilfully constructed, the story is developed with mastery, the characters, though external, are fresh and real. The success of Ariosto's 'Orlando furioso' (q.v.), the evident defects in style—a ruggedness of versification, an excess of Lombard dialecticisms, a sobriety of language, quickly attracted the re-

forming hands of Tuscan purists, whose *rifacimenti*, while polishing and embellishing the form, marred the epic simplicity and directness of the original. The most famous of these revisions, that of Francesco Berni (1542), for three centuries completely eclipsed Boiardo's version. It was only in the 19th century that the original text was reconstituted and that the author recovered his true position as the worthy predecessor to Ariosto. Consult Panizzi, Antonio, 'Orlando innamorato, Orlando furioso,' with an essay on the romantic narrative poetry of the Italians (London 1830-34); 'Studi su M. M. Boiardo' (Bologna 1894); Rose, William Stewart, 'The Orlando Innamorato' (a prose translation from Berni's *rifacimento*, London 1823). A critical edition of the text is by F. Foffano (Bologna 1906-07).

ALFRED G. PANARONI.

ORLÉANS, ôrl'ē-anz (Fr. ôr-lā-ān), the name of several princely houses of France, lords of the county (later the duchy) of Orléans. In 1344 it was an appanage of the cadet branch of the reigning Valois, and under the Bourbons it held a corresponding place. The various families of Orléans may be distinguished as follows: 1st, dating from 1344, containing the single name of Philippe, 4th son of Philip VI. He died in 1375, his 40th year, without legitimate heirs, the duchy therefore reverting to the Crown; 2d, dating from 1391, when Louis, Count of Valois, b. 1372, d. 1407, received the duchy from his brother, Charles VI, and terminated in 1498 by the accession of the then incumbent to the throne as Louis XII; this Louis (q.v.) was son of the poet Charle of Orléans (see Orléans, Charles, Duke of); the 3d, like the first, began and ended with a single duke, Jean Baptiste Gaston (q.v.), brother of Louis XIII, who held it from 1626 to 1660; the 4th important grant of the title was to Philippe, brother of Louis XIV, b. 21 Sept. 1640; d. 9 June 1701, the founder of the House of Orléans-Bourbon, of which only one member has been king of France, namely, Louis Philippe (q.v.). See various names under the heading of Orléans.

ORLÉANS, Charles, Duke of, commonly called CHARLES D'ORLÉANS, French poet and soldier, count of Angoulême: b. Paris, 26 May 1391; d. Amboise, 4 Jan. 1465. He succeeded to the duchy in 1407 on the death of his father, Louis, and like him took a prominent place in French politics, becoming a leader of the party opposing Burgundy and England. Wounded at Agincourt, he was taken captive to England and imprisoned there, probably with little or no severity, being so important a hostage, until 1439. He then married Marie de Clèves, niece of Philippe the Good of Burgundy and thus aroused suspicion against himself at court, where alliances with Burgundy were not looked upon with favor. Charles d'Orléans spent his last years in seclusion from public activity, but was famed as an entertainer and hospitable patron of poets and artists. His poems, including chansons, rondeaux, ballades, etc., some in French, some in Latin, and some in English, written during his captivity, are intensely subjective, entirely free from patriotic feeling or any thought save for his own sorrows, joys and loves. They were edited by d'Hericault (1874).

Consult Beaufils, 'Etude sur la Vie et les Poésies de Charles d'Orléans' (1861).

ORLÉANS, Hélène Louise Elisabeth, DUCHESS OF, wife of the Duke of Orléans, Ferdinand, son of Louis Philippe: b. Ludwigs-lust, 24 Jan. 1814; d. Richmond, England, 18 May 1858. The daughter of Friedrich Ludwig, Grandduke of Mecklenburg-Schwerin, she married 30 May 1837, lost her husband 13 July 1842 and devoted herself to the education of her sons, the Comte de Paris (see PARIS, LOUIS ALBERT PHILIPPE, COMTE DE), and the Duc de Chartres, in whose behalf, in 1848, after the abdication of Louis Philippe, their grandfather, she appealed in vain to the National Assembly. She removed, first to Ems, then to Eisenach and finally to England. She was a woman of many accomplishments. Consult Schubert, 'Biography' (1877).

ORLÉANS, Henri, PRINCE OF, French explorer, eldest son of Robert, Duc de Chartres: b. Ham, near Richmond, Surrey, England, 6 Oct. 1867; d. Saigon, Indo-China, 9 Aug. 1901. At 22 with Bonvalot he traveled through central Asia to Tonquin; received the medal of the French Geographical Society in 1890, having traveled through India, Afghanistan and Japan in the interval; and in the next six years explored Abyssinia (1891), Laos and Siam, Madagascar (1894) and Tibet and Yunnan (1895-96), discovering the sources of the Irawady on this last journey. He gained great popularity in France, notably by his bold colonial policy, which was a constant source of irritation to England; and yet his bid for the favor of the army in his defense of it during the Dreyfus case was unsuccessful, being rather too open. His experiences in Abyssinia led him to criticize harshly the Italian officers in captivity there, and in 1897 he was challenged to a duel and wounded by the Count of Turin. Early in 1901 he left France for Annam, where he died in August. He wrote 'Six Mois aux Indes' (1889); 'De Paris au Tonkin et travers le Thibet inconnu' (1891); 'Une Excursion en Indo-Chine' (1892); 'Autour du Tonkin' (1893); and 'A Madagascar' (1895).

ORLÉANS, Jean Baptiste Gaston, DUKE OF, third son of Henry IV of France, and brother of Louis XIII: b. Fontainebleau, 25 April 1608; d. Blois, 2 Feb. 1660. His character was weak and yielding, and he was continually involved in plots, first against his brother, Louis XIII, and Richelieu, and then against Anne of Austria and Mazarin. In 1626 he was made Duke of Orléans and he married Mary of Bourbon, Duchess of Montpensier. A mere tool of Cardinal Richelieu's enemies at court, he entered a conspiracy against Richelieu's life, which was discovered and crushed. The Duke lived temporarily at peace with Richelieu, only to join Marie de' Medici, his mother, in a new intrigue against the minister in 1631, which resulted in the complete triumph of Richelieu and the flight of the Duke to Lorraine. There in 1631 he married Marguerite, sister of Charles IV, Duke of Lorraine. He returned to France in 1634; plotted to kill Richelieu in 1636, purchasing his own pardon by sacrificing the lives of his accomplices; joined the plot of Cinq Mars in 1642, but again escaped punishment; and after the death of Louis XIII became lieutenant-general of the

realm (1643). But his part in the Fronde, where he was clearly the tool of De Retz, was too flagrant to be passed over, and in 1652 he was banished from court to Blois. Consult his 'Memoirs,' written by Mlle. de Montpensier (q.v.).

ORLÉANS, Louis Albert Philippe, COMTE DE PARIS. See PARIS, LOUIS ALBERT PHILIPPE, COMTE DE.

ORLÉANS, Louis Philippe Joseph, 100-è fè-lèp zhō-zéf, DUKE OF, great-grandson of the Regent of France, Philippe, Duke of Orléans: b. Saint Cloud, 13 April 1747; d. Paris, 6 Nov. 1793. Duke of Montpensier during his grandfather's last years, and from 1752 to 1785, Duke of Chartres, he succeeded his father in the last named year. He married, in 1769, Louise Marie Adélaïde, daughter of the Duke of Penthièvre, showed himself a voluptuary like the Regent and governed by strange whims. The accusation of cowardice brought against him for his part in the battle of Ouessant and the refusal to make him grand-admiral, in spite of his hereditary right to that post, made him a bitter enemy of the court. In 1787 he was a member of the Assembly of Notables and as such declared against the ministerial proposals and was exiled as a result. With the approach of the Revolution he gave up his rank, became a pronounced republican, joined the Jacobins (1789), assumed the name of Citizen Philip Egalité, voted with some degree of moderation in the Constituent Assembly, but in the convention joined the Mountain and voted for the death of the king. This action seems to have opened the eyes of his colleagues to his apparent desire to be made king himself, and 6 April 1793 the arrest of all members of the Orléans family was voted by the Convention. He was accused of high treason but was declared innocent by the tribunal of the Département Bouches du Rhône. Shortly afterward, he was brought before the Revolutionary Tribunal in Paris and, by it, condemned to death and executed the same day (6 Nov. 1793). Consult the exhaustive article by Monin in 'La Grande Encyclopédie'; and the biographies by Tournois (1842-43), Montjoie (1796), Ducoin (1845) and Crétineau-Joly (1862); also Carlyle, 'French Revolution.'

ORLÉANS, Louis Philippe Robert, rō-bār, DUKE OF, son of the Comte de Paris: b. Twickenham, England, 6 Feb. 1869. He was educated in France at Eu and Stanislas College and afterward studied at Sandhurst Military College, England. He was exiled, together with his father, by the law of 23 June 1886, and entering the British army, he served in India for two years. In 1890 to rouse Orleanist sympathy he returned to France and attempted to enter the army as a French citizen. He was sentenced to two years' imprisonment on 6 Feb. 1890, but was pardoned and sent out of France in June of the same year, the government realizing that his punishment might aid the Royalist cause. He traveled extensively in Asia from 1890 to 1895. In 1894 upon the death of his father he became the recognized leader of the Royalists. He married 5 Nov. 1896 Maria Dorothea, archduchess of Austria but separated from her. He led an expedition, in 1905, to explore the northeast coast of Greenland and adjacent sea; and followed this with another in

1907 to the Kara Sea. He made a collection of the letters of several of the Bourbons. Among his published works are 'Un croisière au Spitzberg' (1905); 'A. travers la banquise' (1907); 'La revanche de la banquise' (1909); 'Chasses et Chasseurs arctiques' (1911).

ORLÉANS, Philippe, DUKE OF, son of Louis XIII, styled "Monsieur" during the reign of his brother Louis XIV: b. Saint Germain, 21 Sept. 1640; d. Saint Cloud, 9 June 1701. He was the founder of the existing house of Orléans. Originally Duke of Anjou, in 1660 he succeeded Jean Baptiste Gaston, Duke of Orléans (q.v.), his uncle. In 1661 he married Henrietta, sister of Charles II of England, of whom he was very jealous, even resenting the favor shown her by Louis, who made use of her in effecting his alliance with the English king in 1670. Henrietta died in the same year, possibly poisoned; and in 1671 the Duke married Charlotte Elizabeth, daughter of the Elector Palatine. He fought in the Netherlands against William of Orange with such success that his royal brother relieved him of command, fearing his growing prestige. His two daughters by his first marriage were Marie Louise (1662-89), wife of Charles II of Spain, and Anne Marie (1669-1728), wife of Victor Amadeus of Savoy; by the second marriage he had a son, Philippe (q.v.), and a daughter Elizabeth Charlotte (1676-1744), who married in 1698 Leopold of Lorraine.

ORLÉANS, Philippe, DUKE OF, son of Philippe of Orléans and nephew of Louis XIV: b. Saint Cloud, 2 Aug. 1674; d. Versailles, 2 Dec. 1723. According to the custom established by his father he bore the title of Duc de Chartres as eldest (only) son. He was able but somewhat profligate; married in 1692 at the wish of Louis XIV, Mlle. de Blois, the king's daughter by Mme. de Montespan; quickly made himself famous as a soldier by his exploits at Mons (1691), Steenkirk (1692) and Neerwinden (1693); and like his father was practically removed from the army because of the spite of Louis XIV until his father's death. He was defeated at Turin in 1706 by Prince Eugene, but more than regained his laurels in Spain in 1708, by the brilliant capture of Lerida. His success and the rumor of intrigues with the English to make him king of Spain enforced renewed retirement in 1708. The successive deaths of the Dauphin and the Duke and Duchess of Burgundy and their son in 1711-12 were laid by gossips to his door, but he seems to have been more occupied at this time with alchemy, arts, letters and a life of pleasure than with politics. By right of birth he became (1715) regent during the minority of Louis XV. His policy was bold, quite the reverse in its details from that of Louis XIV. He restored the power of the nobles; withdrew laws against Protestants; aimed at canceling the revocation of the Edict of Nantes; joined the Quadruple Alliance, and in other ways showed himself a friend of England; attempted to reform French finance, but made bad worse by acting on the advice of John Law (q.v.); and even after 1723 when the king came of age retained much actual power for a time through Cardinal Dubois (his old tutor), whom he had made Prime

Minister. On the death of Dubois, he became himself Prime Minister in August 1723 and held office until his death the following December. Consult the biographies by La Motte, Capefigue and Baudrillart; and the histories of the regency by Lemontey, Piossens, Marmontel, Lacretelle and Wiesener; as well as the 'Mémoires' of Saint Simon, Marais and Buvart.

ORLÉANS, France, a city, capital of the department of the Loiret, situated on the right bank of the Loire, 77 miles southwest of Paris. A magnificent bridge of nine arches connects it with the populous faubourg of Saint Marceau. The houses are well built, but the streets in general are narrow and crooked. It has some handsome public squares, a Gothic cathedral; two hôtels-de-ville; the Palais de Justice; the Musée, containing a curious collection of local antiquities; the theatre, and other edifices worthy of notice. The manufactures and trade of the place are considerable, but have lost much of their former importance. There are several worsted and cotton mills, numerous sugar refineries, vinegar works, breweries and manufactures of hosiery, ironmongery, pottery, etc. Orléans was the Gallic Genabum destroyed by Cæsar 52 B.C., and rebuilt as Aurelium, whence the corruption Orléans. Philip of Valois erected Orléans into a duchy and peerage in favor of his son, and Orléans has since continued to give the title of duke to a prince of the royal line of France. Philip the Fair instituted a university here in 1312, which formerly had great celebrity. In 1428 the city sustained a siege against the English, and was relieved by the Maid of Orléans (see JOAN OF ARC), whose statue in bronze stands in one of the public squares. It was taken and retaken more than once in the Franco-German War in the latter part of 1870. Pop. about 75,000.

ORLÉANS, Isle of, Canada, in the Saint Lawrence River below Quebec at the head of the estuary 650 miles from the ocean. It is dependent to Montgomery County, is about 22 miles long and has an area of 70 square miles. On account of its numerous grave vines Jacques Cartier first named it the Isle of Bacchus, in 1535. The soil is fertile, well-wooded, and fruit culture is the chief industry. The villages along its shores are popular picnic and summer resorts, and include Beaulieu, Saint Pierre, Sainte Famille, Saint François, Saint Jean, Saint Laurent, d'Orléans being usually affixed to particularize them. General Wolfe encamped here in 1759 before the siege of Quebec.

ORLEANS, TERRITORY OF, in American history, a name formerly applied to a section of the United States. When the large tract of northwest territory was purchased from France by the United States in 1804, under the name of Louisiana, the district was divided by Congress into territories, called the District of Louisiana and the Territory of Orleans, the latter being the present area of the State of Louisiana. In February 1811, an act was passed "to enable the people of the Territory of Orleans to form a constitution and State Government," and on 12 April 1812 another act was passed for the admission of the State of Louisiana into the Union. See LOUISIANA.
